Preface

The global information ecosystem is undergoing a profound revolution. Driven by rapid technological disruption, changing user demographics, and shifting socio-economic realities, the traditional boundaries of the library have dissolved. Today, libraries are no longer mere storehouses of books; they are dynamic innovation hubs, centers for community empowerment, and the vital infrastructure upon which the knowledge economy is built.

For centuries, libraries have served as the custodian of knowledge, the arbiters of information, and the vibrant hubs of community engagement. From the scrolls of Alexandria to the digital repositories of today, their fundamental mission has remained constant: to connect people with the information they need to learn, grow, and thrive. But as the 5th Industrial Revolution gather pace, the very definition of "information" and "service" is undergoing a radical re-evaluation in library and information profession. In response to the above, the Nigerian Library Association hosts her 64rd National Conference at Minna, Niger State from 12th to 17th July, 2026 culminating in this landmark two-volume book of proceedings with the Theme *"Our Future, Our Hope: The State of Libraries and Librarianship in Nigeria"*. It is a theme that is considered very apt in the face of rising competitiveness in the information market and the quest for professional identity and relevance among library and information professionals in Nigeria. This collection stands as a testament to the resilience, adaptability, and intellectual vigor of Nigerian information professionals at a defining moment in our history.

This book is an invitation to librarians, information professionals, educators, policymakers, and indeed, anyone invested in the future of knowledge, creation, access, and use to contemplate the profound implications of this new era. The proceedings provide a comprehensive reflection on contemporary developments, emerging trends, persistent challenges, and future directions for libraries and librarianship in Nigeria. It has also encouraged scholarly engagement with strategies for building resilient, innovative, and inclusive library systems. Collectively, the papers demonstrate that although libraries in Nigeria continue to face challenges associated with funding, infrastructure, technology adoption, policy implementation, and human capacity development, there are numerous opportunities for renewal through research, innovation, strategic partnerships, and professional collaboration.

The conference tagged "Minna 2026", attracted 292 papers on the various sub-themes of the conference theme. Each submission was reviewed by selected experts/professionals in the relevant areas of Librarianship and Information Science. After each paper was subjected to scrutiny by the reviewers, 220 papers were selected and presented at the Conference. The selected papers were assembled in this book of proceedings. The contributions span diverse thematic areas, including Artificial Intelligence and emerging technologies in libraries, the state and of school libraries, public library development in Nigeria, academic and special library services, information and knowledge management, digital preservation, information literacy, collection development, professional ethics, capacity building, library and information science education and the role of professional associations in promoting excellence and sustainability within the library profession. These themes underscore the multidisciplinary nature of Library and Information Science and highlight the evolving responsibilities of libraries in supporting education, research, innovation, lifelong learning, and national development.

We specially thank the participants of the 64th NLA National Conference 2026, for their unalloyed cooperation, loyalty, support and contributions over the years. Gratitude is also extended to the reviewers for their valuable time, expertise, and constructive evaluations, which ensured the academic quality and integrity of the published papers. Their collective efforts have contributed significantly to the success of this publication.

It is hoped that these proceedings will serve as an important resource for researchers, librarians, educators, students, policymakers, and other stakeholders in the information sector. Beyond documenting the scholarly contributions presented at the conference, the volumes are expected to stimulate further research, encourage professional dialogue, inform policy development, and inspire innovative practices that will strengthen libraries and librarianship in Nigeria and beyond

Dr. Juliet C. Alex-Nmecha
Vice President & Chairman, National Organizing Committee

Table of Content

A Comparative Analysis of IFLA Foundational Knowledge Areas and NBTE Library and Information Science Curriculum in Nigeria: Alignment, Gaps and Implications - Ahmed Abayomi Ayandokun & Carl N. Nworu **1**

A phenomenological Study on Professional Association Deficiencies in Nigeria: Librarianship in Focus - Yusuf Ayodeji AJANI, Roseline Ifeoma ECHEZONA & Abdulganiy Okanla AHMED **29**

Academic Libraries and Democratic Awareness among University Students in Nigeria: Evidence from University of Nigeria, Nsukka - Stella Chikezie Aguwa, CLN, MLIS; Amarachi Glory Alala, CLN, PhD; Inemesit Udom Udoh, CLN, MLIS & Ekpendu Chibuzo C. **41**

ADOPTION OF ARTIFICIAL INTELLIGENCE IN STRENGTHENING UTILIZATION OF MEDICAL INFORMATION RESOURCES AND SERVICES BY HEALTH INFORMATION PROFESSIONALS IN NIGERIA- Yemisi Oluremi OLADAPO (PhD) & Prof. Adeyinka TELLA **49**

ADOPTION OF SMART TECHNOLOGIES BY LIBRARIANS IN REDESIGNING MODERN ACADEMIC LIBRARIES IN HIGHER INSTITUTION LIBRARIES IN KEBBI STATE, NIGERIA - Babangida Abba, Ibrahim Aliyu& Zayyanu Ahmed Dada **53**

ADVERTISING LIBRARY SERVICES USING GOOGLE OUTCOME - Saidu Muhammad Jika PhD, Yakubu Attahiru Liman PhD, Shuaibu Umar, Abubakar Umar , Yusuf Danladi & Shaibu Adamu **61**

ADVOCACY AND MARKETING PRACTICES IN NATIONAL LIBRARY OF NIGERIA, KADUNA BRANCH – Danjuma Mohammed & Isreal Abimaje Ochai **69**

ADVOCACY FOR FUNCTIONAL CORPORATE LIBRARIES IN NIGERIA: IMPLICATIONS FOR LIBRARIANS' RELEVANCE AND PROFESSIONAL VISIBILITY - KAREEM Abdulraheem Onivehu (CLN), JIBRIL, Oyiza Harithat (CLN) & AKOBE, Oluwatosin Daniel (CLN) **72**

AI Behind the Scenes: Student Attitudes Toward Declaring Generative AI Use in Academic Writing in Nigerian Library Schools - Bolaji David Oladokun & Dumbiri Rita **79**

An Overview of Artificial Intelligence in Transforming Reference Services in Nigerian University Libraries – Ojo. Joshua Onaade, PhD & Adegoroye, Adebola Oluwayokun **94**

Application of Digital Skills for Innovative Library Services Delivery in Distance Learning Programme by Librarians in National Open University of Nigeria - Dr. Lucy Ndidiamaka & NEBEOLISE OKONKWO (CLN) **100**

APPLICATION OF INFORMATION AND COMMUNIATION TECHNOLOGY ON THE UTILIZATION OF ELECTRONIC INFORMATION RESOURCES BY STUDENTS OF KATSINA STATE INSTITUTE OF TECHNOLOGY AND MANAGEMENT – Sa'adatu Lawal BK (CLN, MNLA) & Musa Abubakar Garba (CLN) **109**

APPLICATION OF ROBOTICS IN SHELVING MAINTENANCE FOR IMPROVED LIBRARY SERVICE AND OPERATIONS - GOSHIE, Rhoda Wusa (Ph. D), Abdulkarim, Murjanatu & Bukar Inuwa PhD **115**

Artificial Intelligence and Information Service Delivery in University Libraries in Abia State, Nigeria - Chibuzo Christian Ekpendu, Kenneth Chinwendu Akpuru, & Stella Aguwa CLN, MLIS **122**

ARTIFICIAL INTELLIGENCE AND THE FUTURE OF LIBRARIES IN NORTHEASTERN NIGERIA: READINESS, CHALLENGES, AND OPPORTUNITIES - Bukar, Inuwa Ph.D., M.L.S, C.L.N. **130**

Assessing the Impact of Open Access Initiatives on Research Output of Academic Librarians in Niger State Universities – ADAMU, Mahmud CLN & Fatima Ladan Yusuf CLN **136**

Assessing the Perceived Impact of Institutional Repositories among Faculty and Students in the Nigeria Maritime University, Okerenkoko, Delta State - Dr. Fatimah Jibril Abduldayan, Dr. Abduldayan Aishat Haruna, Martha Tizhe, Confidence Reghagwa Idjai, Oghenetega Agbori & Rabi Ahmed Shehu **145**

ASSESSING THE READINESS OF ACADEMIC STAFF TO ADOPT AI-DRIVEN TECHNOLOGIES FOR TEACHING AND RESEARCH ACTIVITIES IN FEDERAL POLYTECHNIC, WANNUNE - Charles Terwuese TSENONGU, Jovita Egondu NNADI & Chivir CHIA **153**

ATTITUDE TOWARDS MOBILE TECHNOLOGY DEVICES AND INFORMATION PROVISION AS CORRELATES OF RESEARCH ACTIVITIES AMONG POSTGRADUATE STUDENTS IN UNIVERSITIES IN NORTH-CENTRAL, NIGERIA - YUSUFU, Shehu Amanyi, PhD, CLN, YISADOKO, Samuel B.Tech, M.Tech & AKAAKA, Dooshima Theresa **162**

Bibliometric Analysis of Science Education Masters' Theses at Federal University of Technology, Minna: A Citation Analysis Perspective for Library Collection Development - Iloka, E. C., Salau, S. A., PhD, Obim, I. E. PhD, Chuks-Ibe, P. O. PhD & Prof. Umeh, A. E. O. **172**

Challenges and Opportunities of Implementing Digital Library Services in Academic Libraries in Niger State - ADAMU, Mahmud CLN & Rabi Shehu Ahmed CLN **181**

Challenges in Accessing Electronic Health Information Resources in Nigerian Medical Libraries: A Case Study of Nnamdi Azikiwe Teaching Hospital, Nnewi - Dr. Lucy Ndidiamaka NEBEOLISE OKONKWO, Dr. Igwe UKOHA & Mariam Gambo IBRAHIM **192**

Challenges to Visibility within Institutional Repository: An Analysis of Librarians Perspectives in North-Central Nigerian Universities - Imoisili O. Odigie, Prof. G.A Babalola, Prof J. Udensi, & Dr S. Salau **200**

Community Engagement and Trust in AI-Based Information Services: A Case Study of Rural Libraries in Ebonyi State – Dr. Ify Evangel Obim (CLN), Barile Yira Nneh (CLN) & Chika H. Nwadike **206**

COMMUNITY ENGAGEMENTS THROUGH LIBRARY INNOVATIONS AND CREATIVITY IN SOUTH-SOUTH NIGERIA - Michael Akan Afukidang & Ebaye Asenath Slyvester **220**

Composite Effect of Attitude to Mobile Technology Devices and Information Provision as Correlates of Postgraduate Students; Research Activities in Universities in North-Central, Nigeria - YUSUFU, Shehu Amanyi, PhD, CLN & BABALOLA, Gideon Adesina PhD,CLN (Prof) **227**

CURRENT STATE OF GOVERNMENT MINISTRY LIBRARIES IN IMO STATE - IWUAGWU Paulina Ifeoma Ph.D, CLN & NSE Judith S. Ph.D, CLN **240**

Current State of University Library Funding in Nigeria: Challenges, Consequences and Strategies - Prof. Katamba Abubakar Saka & Peter Yohanna Mshelia, PhD **248**

Curriculum Relevance in Library schools in South-East Nigeria: Are graduates prepared for contemporary information work? Dr Akpom Chinwendu.C, Dr Ike Patricia, Chika, Dr Onyam, Ijeoma.D. & Dr Idoko Nkechi . A **260**

Data Literacy and Research Data Management as Predictors of Open Research Practices among Polytechnic Lecturers in Kwara State, Nigeria - Kennedy Arebamen Eiriemiokhale, Ph.D., Shuaib Agboola Olarongbe, Ph.D., Abdulakeem Sodeeq Sulyman, Yakub Olayinka Ahmed, Ph.D. & Yusuf Umar **272**

Democratic Governance and National Development in Nigeria: an appraisal on the roles of libraries during democratic dispensations - Ahaneku, Ebere Juliet, Okorie, Justice Nnamdi PhD & Amajoyi, Chigozirim Wisdom **284**

Demographic Characteristics and Knowledge of Open Data Practices among Academic Librarians in selected Federal Universities in Nigeria - Charity Ezinne Maxwell, PhD, (CLN) MNLA, Rabiu Mohammed Aliu PhD & Bolaji David Oladokun **291**

Digital Contents Innovation as Correlates of Librarians' Job Performance in Academic Libraries in Delta State – Adaora Maudline ORAKPOR (PhD, CLN), Maria Ene ADAH (CLN) & Oluchi Bridget IBEH (PhD, CLN) **302**

DIGITAL LITERACY AND INFORMATION AND COMMUNICATION TECHNOLOGY PROFICIENCY FOR ELECTRONIC INFORMATION RESOURCE UTILIZATION AMONG LECTURERS AT KWARA STATE POLYTECHNIC, ILORIN - ABDULLAHI OLAYINKA ISIAKA, ABDULLAHI ADEBOLA YUSUF, AJEIGBE EMMANUEL AFOLAMI, FAUSAT KEHINDE ADENARIWO & MERCY OMOLOLA OGUNLEYE **309**

Digital Literacy and Research Skills Influencing Library Resource Use by Postgraduates at the National Open University of Nigeria - Mercy Enefu OKWOLI (PhD, CLN), Babarotimi Opeyemi OLUWASEUN, Isah Osimetha SEIDU (PhD, CLN) & Grace Ndukwe ELEM (PhD) **318**

Digital Platforms Connections: How Academic Libraries in Imo State Are utilizing Social Media for library service delivery - Judith S. Nse Ph.D CLN, Uchenna Elvis Ubochi Ph.D CLN, Nwadibia Uloma & Leona Ebere Ekwebelem Ph.D **326**

Digital Readiness and Service Innovation in Selected Academic Libraries in Ebonyi State, Nigeria - Dr. Romanus Okechukwu Attama, Ahmed Abayomi Ayandokun & Dr. (Mrs) Ifeoma Chigozie Okechukwu **334**

Electronic Resources and Academic Activities in Federal University Libraries in North-East Nigeria: Users' Perception and Utilization - Hafsat Olaide Salah CLN **347**

EMERGING TECHNOLOGIES FOR RESEARCH PROCESS: AN EXPLORATION OF LECTURERS' PERCEPTIONS AND USABILITY - ABDULLAHI OLAYINKA ISIAKA, AJEIGBE EMMANUEL **354**

AFOLAMI, BENJAMIN ADEBISI BAMIDELE, SULYMAN OLAITAN MAHAMMUOD & BOLANLE FADERERA ODEBUNMI

Emerging Trends Shaping the Future of Library and Information Science Research in Lokoja Journal of Information Science in Nigeria: A Descriptive Content Analysis - Ezra Shiloba Gbaje, Lois Yabanet, Imoisili Odigie & Abigail Tulubo Kure **365**

EMOTIONAL INTELLIGENCE AS A PREDICTOR OF RESEARCH PRODUCTIVITY AMONG MEDICAL LECTURERS IN FEDERAL UNIVERSITIES IN NORTH-WEST NIGERIA: A QUANTITATIVE STUDY - Hamza Ibrahim Datti, Prof. J. N Udensi, Prof. Katamba Abubakar Saka & Prof. N. U Adabara **374**

Empowering African Information Professionals through Cooperative Librarianship and Technological Innovation for Sustainable Service Delivery - Onyam, Ijeoma Dora & Idoko, Nkechi Anthonia **382**

Equipping Librarians and Information service Professionals for innovative library services in the 21st century in Nigeria - Charles Terwuese TSENONGU, Bonnie Obeka OBANDE & Stella Chikezie AGUWA **389**

EQUIPPING LIBRARIANS AND INFORMATION SERVICE PROFESSIONALS WITH DIGITAL TECHNOLOGY SKILLS FOR INNOVATIVE LIBRARY SERVICES ACADEMIC LIBRARIES IN NIGERIA - Yakubu Attahiru Liman, PhD, Jika Saidu Muhammad, PhD, Muhammad Modibbo Umar, Umar Shuaibu & Olusegun Victor Olaogun **396**

EQUIPPING LIBRARIANS AND INFORMATION SERVICES PROFESSIONALS FOR INNOVATIVE LIBRARY SERVICES IN THE 21ST CENTURY AT BAZE UNIVERSITY AND THE NATIONAL OPEN UNIVERSITY OF NIGERIA - IBRAHIM, MARIAM GAMBO & ORAGBE USHAHEMBA **403**

Equipping Librarians for Innovative Library Services in the 21st Century: Implications for Academic Libraries in Nigeria - Musa, Hussaini **410**

ETHICAL USE OF ARTIFICIAL INTELLIGENCE (AI) TECHNOLOGIES FOR REFERENCE SERVICE PROVISION IN ACADEMIC LIBRARIES - Murjanatu Abduhamid (Ph.D), Hussaini MUSA, Abu Ahmed (PhD), Garba Mohammed Shambo (PhD) & Dahiru Dauda Anache **419**

Evaluation of the Nigerian Library School Curricula for Workforce Readiness - Farouq Olakunle MALIK, Yusuf Ayodeji AJANI, Oladimeji Eyitayo YEMI-PETERS, Emmanuel Adeniyi OLONIRUHA & Bolaji David OLADOKUN **431**

Exploring the Potential of Gamified Moodle for Innovative Pedagogies in LIS Education: Insights from Federal Universities in North Central Nigeria - Babarotimi Opeyemi OLUWASEUN, Grace Ndukwe ELEM (PhD), Mercy Enefu OKWOLI (PhD) & Mariam Gambo Ibrahim, **441**

ETHICAL PERCEPTIONS AND RESPONSIBLE USE OF GENERATIVE ARTIFICIAL INTELLIGENCE IN HIGHER EDUCATION BY UNDERGRADUATE STUDENTS - Johannes Adedokun Badejo, Ph,D, Azeez Adebamgbola Adeoye, Ph.D, Muhammed Ismaila Olaitan & Esther Adebisi, **451**

Fostering Creativity and Collaboration in Libraries through the Development of Maker Spaces and Innovation Hubs - Fati Abubakar, (Ph.D), Hussaini MUSA, (Ph.D), Murjanatu Abduhamid, Musa, Imam Shekarau, Ladan Dogara & Hajara Jibril **466**

FROM SILENCE TO STRATEGY: REDEFINING ACADEMIC LIBRARY VISIBILITY IN THE DIGITAL AGE - Abdulahi Mayowa, OLANIYI, Blessing Chika, FUNOM (Ph.D.) & Roseline Ifeoma, ECHEZONA (Ph.D.) **472**

Generative Artificial Intelligence Literacy among Librarians in Higher Education Institutions: A Systematic Review – Adeyinka Tella, Ganiyu O. Adigun, Bolaji David Oladokun & Yusuf Ayodeji AJANI **481**

HARNESSING ARTIFICIAL INTELLIGENCE TOOLS FOR ROUTINE LIBRARY SERVICES: A CASE STUDY OF SELECTED ACADEMIC LIBRARIES IN KADUNA - Michael Esew, PhD, CLN, Mohammed Abubakar Abdullahi, PhD, CLN & Lami Gillian Daniel **497**

Impact of Creative Library Programs on Community Participation: An Empirical Study of Public Libraries in Katsina State - Suleiman Idris, Ph.D. **506**

IMPACT OF MEDICAL LIBRARY ON THE PROVISION OF HEALTH INFORMATION SERVICES TO USERS IN TEACHING HOSPITALS IN KEBBI STATE, NIGERIA - Zayyanu Ahmed Dada, Ibrahim Aliyu & Babangida Abba **513**

INDIGENOUS KNOWLEDGE SYSTEMS AND COMMUNITY-BASED INFORMATION SERVICES FOR SUSTAINABLE DEVELOPMENT - ABDULLAHI OLAYINKA ISIAKA, BILIAMIN ABIOLA AREMU, ADELANI ROTIMI IBITOYE, MERCY OMOLOLA OGUNLEYE & SULYMAN OLAITAN MAHAMMUOD **521**

INFLUENCE OF AWARENESS ON THE USE OF SMART AGRICULTURAL TECHNOLOGY FOR IMPROVED PRODUCTION BY SMALLAHOLDER FARMERS IN FUNTUA ZONE, KATSINA STATE, NIGERIA - Garba Danladi Duru, Musa Abubakar Garba & Sa'adatu Lawal BK **533**

INFLUENCE OF KNOWLEDGE ORGANIZATION TOOLS (KOTs) PROFICIENCY AND EXPERTISE ON EFFECTIVE KNOWLEDGE MANAGEMENT PRACTICES (KMPs) AMONG LIBRARIANS IN UNIVERSITIES IN KWARA STATE, NIGERIA - ABDULLAHI OLAYINKA ISIAKA, SULYMAN OLAITAN MAHAMMUOD, BILIAMIN ABIOLA AREMU, BOLANLE FADERERA ODEBUNMI, AJEIGBE EMMANUEL AFOLAMI & BENJAMIN ADEBISI BAMIDELE **541**

INFORMATION HOARDING IN DIGITAL ERA: IDENTIFYING THE FACTORS AMONG LIS POSTGRADUATES IN KWARA STATE - ABDULLAHI OLAYINKA ISIAKA, ADELANI ROTIMI IBITOYE, FAUSAT KEHINDE ADENARIWO, ABDULGANIYU OLUWASEUN YUSUF & BENJAMIN ADEBISI BAMIDELE **548**

Information Needs of Internally Displaced Persons (IDPs) for Socio-Economic development in Selected IDP Camps in Northeast Nigeria - Dr. Hadiza Eneze Gomina CLN, Dr. Ibrahim Wada CLN & Hafsat Olaide Salah CLN **557**

INFORMATION SERVICES FOR RURAL COMMUNITY GROWTH IN NIGERIA - Saadiya Amata Bello, Maimuna Suleiman Ibrahim & Sim Catherine Sarki **564**

Institutional and Competency Gaps for AI-Enabled Services: Perspectives of University Librarians in Nigeria - Iliyasu Adamu JAGABA, Ganiyu Ojo ADIGUN, Farouq Olakunle MALIK, Yusuf Ayodeji AJANI & Abdulganiy Okanla AHMED **569**

Investigating awareness, frequency of use, perceived benefits challenges and demographic factors associated with artificial intelligence tools for academic writing by academic librarians in university libraries in Nigeria - Columbus O. Udofot, *PhD* & Bolaji David Oladokun **580**

Investigating the Interrelationships Between Digital Literacy, Research Skills and Scholarly Productivity of Librarians in Kwara State, Nigeria - Abdulakeem Sodeeq Sulyman, Hammed Taiwo Saka, Shuaib Agboola Olarongbe, Ph.D., Kennedy Arebamen Eiriemiokhale, Ph.D. & Florence Olabisi Ajani, Ph.D. **592**

INFLUENCE OF THE USE OF ARTIFICIAL INTELLIGENCE BY RESEARCHERS ON KNOWLEDGE SHARING IN UNIVERSITIES IN KATSINA STATE, NIGERIA - Dr. Hindatu Salisu Abubakar, CLN, MNLA, FIPMD, FCAI, Dr. Hauwa Sani Ahmed, Shamsuddeen Ahmed, MNLA, MNIM, FCAI, Usman Mohammed Dutsin-Ma, MNLA & Nasir Umar Maiwada, MNLA **605**

LAW LIBRARIES AND THE LEGAL INFORMATION ECOSYSTEM IN NIGERIA: A CRITICAL EXAMINATION OF ACQUISITION, DISSEMINATION, AND USE - Chibuzo Christian Ekpendu, Kenneth Chinwendu Akpuru & Onyinyechi Goodluck Amaefule **612**

LECTURERS' AWARENESS AND READINESS FOR ADOPTION OF ARTIFICIAL INTELLIGENCE FOR TEACHING IN NIGERIAN TERTIARY INSTITUTIONS - Shuaib Agboola Olarongbe, Ph.D., Abdulakeem Sodeeq Sulyman, Kennedy Arebamen Eiriemiokhale, Ph.D., Musa Olaoti Rasaq & Yahaya Aliyu Ismail **620**

Leveraging Artificial Intelligence for Innovative Library Services in 21st Century Nigeria: An Empirical Study - Mujeeb Opeyemi NASIR, Yemisi Oluremi OLADAPO (Phd) & Prof. Adeyinka TELLA **637**

LEVERAGING ARTIFICIAL INTELLIGENCE FOR REFERENCE SERVICE DELIVERY IN ACADEMIC LIBRARIES: A SYSTEMATIC REVIEW - Juliana Akpan Benson, Blessing Nsikan Usoro & Bolaji David Oladokun **644**

LEVERAGING ARTIFICIAL INTELLIGENCE FOR SUSTAINABLE INFORMATION SERVICE DELIVERY IN ACADEMIC LIBRARIES IN KEBBI STATE, NIGERIA - Ibrahim Aliyu, Babangida Abba & Zayyanu Ahmed Dada **654**

LIBRARIES AND DEMOCRACY IN NIGERIA: OUR FUTURE, THE STATE OF LIBRARIES AND LIBRARIANSHIP IN NORTH CENTRAL NIGERIA - Ebaye Asenath Sylvester & Michael Akan Afukidang **663**

LIBRARIES AND LIBRARIANS AS DIGITAL NAVIGATORS: TRANSFORMING PERCEPTIONS IN NIGERIA'S INFORMATION AGE- Uchenna Elvis Ubochi, Fiatmary Uzoegbu & Judith S. Nse **669**

LIBRARY AND INFORMATION SCIENCE EDUCATION AND PROFESSIONAL DEVELOPMENT IN GOMBE STATE UNIVERSITY - Fatima Sani, Umar Shuaibu, Yusuf Danladi & Yakubu Attahiru Liman, PhD **676**

Abstract

This study is a comparative analysis of IFLA Foundational Knowledge Areas and the National Board for Technical Education Curriculum for Library and Information Science (LIS) Education in Nigeria. The study's main objective was to comparatively analyse the alignment, gaps, and areas of convergence and divergence between the IFLA Foundational Knowledge Areas (FKAs) and the NBTE curriculum for LIS education in Nigeria, with a view to strengthening LIS education and professional practice in Nigeria. The study adopted a documentary research design employing qualitative content analysis and quantitative curriculum mapping techniques. The study relied exclusively on secondary data sources, which included the official IFLA Foundational Knowledge Areas (FKAs) framework for LIS education and the approved NBTE curriculum for National Diploma (ND) and Higher National Diploma (HND) in LIS in Nigeria. Data were analysed using qualitative content analysis. The findings revealed that The NBTE LIS curriculum aligns reasonably well with traditional IFLA FKAs, but alignment weakens in areas related to learning and literacies, digital transformation, research, and ethics. The underrepresentation of certain knowledge areas in the NBTE curriculum may limit graduates' ability to engage in research-driven practice, policy formulation, digital innovation, and global professional discourse. The study concludes that indigenous elements enhance the local relevance of LIS education in Nigeria and ensure compliance with national development goals. However, their heavy emphasis may reduce curriculum space for globally oriented competencies unless deliberate integration strategies are adopted for the introduction of emerging technology competencies to prepare Nigerian LIS graduates for global competitiveness.

***Keywords**:* IFLA Foundational Knowledge Areas, National Board for Technical Education, Curriculum, Library and Information Science Education, Nigeria

Introduction

The dynamic evolution in the information professions, largely influenced by emerging digital technologies in the 5th Industrial Revolution era continues to demand for enhanced disciplinary competencies. These competencies are to be acquired through the education and training of contemporary information professionals including those in Library and Information Science, an interdisciplinary field of study that is concerned with the management of information resources, human and material, in libraries and information centres with the sole aim of getting the information resources and their contents across to a target group of users, i.e. matching the right information with the right people and for the right purpose at the appropriate time (Ayandokun & Musa, 2020). LIS professionals serve as custodians of printed materials, records, photographs, audiovisual materials, and ephemera, in both analogue and digital form (School of Library and Information Science, University of Iowa, 2024). The essence of Library and Information Science (LIS) education, according to the University of Southern Mississippi (2025) is to prepare a diverse population of qualified professionals for roles in libraries, archives, and other information environments. Through evidence-based active learning, students of LIS gain appropriate knowledge, applied scholarship, and skills to serve the information needs of their diverse communities.

Library and Information Science (LIS) education plays a critical role in preparing information professionals who are capable of managing, organising, preserving, and disseminating information resources in diverse formats and environments. Chu et al (2022) state that libraries and information services are essential for culture, science, education, and other sectors, contributing to the sustainable development of individuals, organisations, communities and nations. In the contemporary knowledge society, rapid technological advancements, the proliferation of digital information resources, and the increasing complexity of users' information needs have significantly transformed professional practices within libraries and other information centres. Consequently, LIS education worldwide has undergone continuous curriculum reforms to ensure that graduates possess the requisite competencies, ethical grounding, and professional adaptability needed to function effectively in both traditional and emerging information settings.

At the global level, professional bodies have increasingly influenced LIS education by articulating competency frameworks that reflect international best practices (Alam, 2026). The International Federation of Library Associations and Institutions (IFLA), as the leading global organisation representing the interests of library and information services, developed the Foundational Knowledge Areas (FKAs) to provide a comprehensive framework of core knowledge, skills, and professional values expected of LIS practitioners. The IFLA FKAs encompass areas such as information and knowledge organisation, information access and retrieval, research methods, digital technologies, information ethics, management, user services, and lifelong learning (Chu et al, 2022). These foundational knowledge areas serve as a benchmark for curriculum development, accreditation, and quality assurance across diverse national and institutional contexts.

In Nigeria, the training of Library and Information Science professionals occurs at multiple levels, including universities, colleges of education, and polytechnics. The education and training of middle-level and technical LIS professionals are regulated by the National Board for Technical Education (NBTE), which prescribes curricula for National Diploma (ND) and Higher National Diploma (HND) programmes in Library and Information Science. While the NBTE curriculum is designed to address national manpower needs and local institutional contexts, concerns have increasingly been raised by educators, employers, and professional bodies regarding the extent to which Nigerian curriculum adequately reflects global best practices, emerging competencies, and international professional requirements (Abubakar, 2021; Adeoye et al, 2023; Furfuri, 2023; Onyeachona, 2025; Jegbefume, Ikhimeaku, & Muhammad, 2025), including standards such as those articulated by IFLA in the Foundational Knowledge Areas for Library and Information Science Education. Employers now expect LIS graduates to demonstrate not only technical proficiency but also competencies in digital librarianship, data management, information literacy instruction, research support services, and ethical information practice; areas strongly emphasised in the IFLA Foundational Knowledge Areas. This expectation places renewed pressure on national curriculum frameworks, such as that of the NBTE, to remain current, comprehensive, and internationally competitive.

Despite the growing emphasis on internationalisation, quality assurance, and graduate employability in LIS education (Rani & Sharma, 2021; Okonoko, Abubakar, & Udoh, 2023), there is paucity of empirical evidence assessing the level of alignment or divergence between the IFLA Foundational Knowledge Areas and the NBTE LIS curriculum in Nigeria. This gap raises critical questions about whether graduates of NBTE-accredited LIS programmes are sufficiently prepared to operate effectively in a rapidly evolving information landscape, compete globally, and meet the expectations of contemporary library and information service environments.

More so, most of the recent studies on curriculum of LIS in Nigeria have focused solely on the university curriculum (Babalola et al, 2018; Onwubiko, 2020; Olubiyo, 2022a; Oladokun & Olatokun, 2026) while very few have considered polytechnic LIS education alongside universities in the past (Nwosu, Eyisi & Aghauche, 2013; Saka, Garba & Zarma, 2018). Against this backdrop, this study undertakes a comparative analysis of the IFLA Foundational Knowledge Areas and the National Board for Technical Education curriculum for Library and Information Science education in Nigeria. By examining the content, structure, and competency focus of both frameworks, the study seeks to provide evidence-based understanding that can inform curriculum review, policy formulation, and quality assurance initiatives. Ultimately, such an analysis is expected to contribute to strengthening the relevance, effectiveness, and global responsiveness of Library and Information Science education in Nigeria while improving the capacity of Library and Information Science professionals to contribute towards national development.

Statement of the Problem

Librarians and librarianship in Nigeria have not been receiving the adequate recognition that is commensurate with the goals for which they exist, especially when compared with what is obtainable in the global North where most Nigerian libraries are modelled after. This situation calls for a deep concern considering the importance of the roles libraries are expected to play in societal development. Chu et al (2022) noted that in educating LIS professionals, it is important to develop both disciplinary and cross-sector knowledge. This includes recognising commonalities libraries and information services share with related sectors, such as archives, museums, records management and data management, and developing complementary knowledge from cognate fields, such as computer science, data science, education, and communications. The current status of the innovativeness of Nigerian libraries and information centres is still far from the contemporary innovative services being offered in developed societies. Over the years, much attention has been focused on the facilities than competencies and the training to acquire such competencies for the delivery of contemporary library services. This leads to continued expanding gaps between service delivery and expectations, threatening the relevance and reputation of libraries as social institutions and librarians as critical stakeholders in nation building.

The dynamic transformation of the global information environment, driven by emerging digital technologies, data-intensive practices, the birth of more competitive information professions and evolving user expectations, has significantly reshaped the competencies required of contemporary library and information professionals. In response, the International Federation of Library Associations and Institutions (IFLA) developed the Foundational Knowledge Areas (FKAs) to serve as an internationally benchmarked framework that outlines the core competencies, skills, and knowledge required for effective professional practice in Library and Information Science (LIS) (Chu et al, 2022). These knowledge areas emphasize adaptability, ethical information practice, digital literacy, information organization, research skills, and user-centred service delivery. However, in Nigeria, the National Board for Technical Education (NBTE) curriculum for LIS education in Nigerian polytechnics has not been subjected to such an empirical scrutiny to examine if the curriculum content is fully aligned with these global standards, potentially affecting the quality and competitiveness of Nigerian LIS graduates.

The absence of a systematic comparative analysis of these two frameworks may result in curriculum stagnation, skills mismatch, and reduced professional mobility for Nigerian LIS graduates. Without such an evaluation, efforts at curriculum review, harmonisation, and policy reform may lack empirical grounding. Therefore, there is a compelling need to comparatively analyse the IFLA Foundational Knowledge Areas and the NBTE LIS curriculum to identify areas

of convergence, gaps, and opportunities for curriculum enhancement that will strengthen the relevance, quality, and global competitiveness of Library and Information Science education in Nigeria.

Objectives of the Study

The general objective of the study is to comparatively analyse the alignment, gaps, and areas of convergence and divergence between the IFLA Foundational Knowledge Areas (FKAs) and the NBTE curriculum for Library and Information Science (LIS) education in Nigeria, with a view to strengthening LIS education and professional practice. The specific objectives seek to:

i. Identify and describe the core Foundational Knowledge Areas (FKAs) recommended by IFLA for Library and Information Science education.
ii. Examine the structure, content, and learning outcomes of the NBTE LIS curriculum for Nigerian polytechnics and related institutions.
iii. Determine the extent of alignment between IFLA FKAs and the NBTE LIS curriculum content.
iv. Identify knowledge areas and competencies emphasized in IFLA FKAs but underrepresented or absent in the NBTE LIS curriculum.
v. Identify indigenous, contextual, or regulatory components of the NBTE LIS curriculum that are not explicitly captured in the IFLA FKAs.
vi. Analyse the implications of identified gaps and overlaps for the quality, relevance, and global competitiveness of LIS graduates in Nigeria.

Literature Review

The field of Library and Information Science is situated among the multidisciplinary disciplines, and as such, has been experiencing massive evolution over the years, which has necessitated the expected intervention of its apex professional body, the International Federation of Library and Information Science in recommending a framework that covers the core Foundational Knowledge Areas (FKAs) for the education of Library and Information Science professionals all over the world. They present key LIS foundational knowledge areas (FKAs) and the elements for a robust LIS education programme, replacing the 2012 IFLA Guidelines for Professional Library/Information Educational Programmes (Chu, et al, 2022). The 8 Foundational Areas of IFLA include *Information in Society; Foundations of the LIS Profession; Information and Communication Technologies; Research and Innovation; Information Resources Management; Management for Information Professionals; Information Needs and User Services; Literacies and Learning*. The diagram below is a representation of IFLA's FKAs:

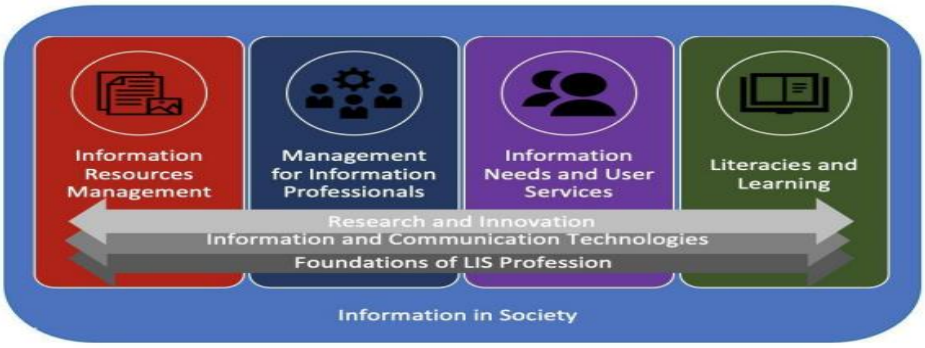

Fig 1: LIS Foundational Knowledge Areas (FKAs) Model (Chu et al, 2022).

According to Okoye and Arimonu (2016), technical education, as enshrined in the Nigerian national policy on education, is concerned with qualitative technological human resources development directed towards a national pool of skilled and self-reliant craftsmen, technicians and technologists in technical and vocational education fields. Technical education in Nigeria is regulated by the National Board for Technical Education. The discipline of Library and Information Science in Nigerian polytechnics is guided by the structure, content, and learning outcomes of the NBTE LIS curriculum for Nigerian polytechnics and related institutions.

A curriculum is referred to as an essential teaching and learning standards-based sequence of planned experiences and central guide for educators, where students practice and achieve proficiency in content and applied learning skills (Department of Education, Rhode Island, 2026). Chu et al (2022) note that LIS, which engages all aspects of information, needs to integrate multiple ways of knowing in its education to prepare professionals to provide effective, equitable, inclusive, and accessible services appropriate to a diverse community and relevant to its local contexts in a globalised economy. The curriculum is therefore not just a set of guidelines to follow in teaching, it is a tool that must indicate the contemporary skills that an intending professional must acquire in order to remain relevant and competitive. Rani and Sharma (2021) iterate that LIS curriculum must be well-designed to fulfill the market demands by including all the essential employability skills for contemporary information practice. All professions require dynamic skills to align with contemporary trends, and LIS is not an exception. This is why Ismail and Khan (2021) assert that the changing

labour market and rapidly evolving library profession demand that library schools constantly update and revitalize their curricula.

Most of the studies on curriculum in Library and Information Science have focused mainly on university education (Babalola et al, 2018; Onwubiko, 2020; Olubiyo, 2022a; Yadav, 2021; Rani & Sharma, 2021; Oladokun & Olatokun, 2026), and by comparing institutional curricular differences rather that comparing the existing curriculum with neutral benchmarks such as IFLA Guidelines and Foundational Knowledge Areas (FKAs). For instance, Ogungbade and Ipadeola (2019) conducted a comparative study of library and information science curriculum in Nigeria library schools. The authors examined the historical and current status of curriculum development in Nigeria. It compared the changes in curricula from various stages and analyzes the factors influencing the curriculum development to include the lack of contents that are germane to the current information landscape. Also, Igwe, et al (2015) reported the curricular enrichment executed at the Department of Library and Information Science, Akanu Ibiam Federal Polytechnic Unwana, Ebonyi State, Nigeria, where innovative and competitive subjects such as Information Literacy Education in the Digital Era, Statistics for Library and Information Services, Perspectives and Opportunities in Library and Information Science, Knowledge Management, Public Relations in Library and Information Science, Infopreneurship and Management Information Systems were integrated into the existing National Board for Technical Education curriculum for LIS education in polytechnics in Nigeria. These were steps taken to enhance the potentials of LIS graduates from the department to fit into the emerging global information landscape.

Understanding the differences between LIS education in developing and developed countries can help identify lapses and gaps, and these gaps need to be identified by comparing LIS curricula to internationally recognised benchmarks, rather than just the curricula of certain institutions. Yet, most studied have compared curricula of developing countries with those of developed countries. For instance, Mortezaie and Naghshineh (2002) conducted a comparative case study of graduate course in library and information studies in the UK, USA, and revealed that there is a widening chasm between LIS education in developing countries without any significant restructuring, and that there is a direct correlation between the efficiency of the courses offered with the state of the information industry in the countries studied. This position, which has a huge implication for the sustainability and practice of LIS in contemporary developing countries is recently upheld by Jegbefume, Ikhimeakhu and Muhammad (2025) who revealed that outdated curricula is one of the main factors that limit the ability of LIS graduates to meet the demands of the modern information environment in developing countries.

According to the National Board for Technical Education (2020), the curriculum of LIS is divided into two levels. One part is the National Diploma Curriculum while the other is the Higher National Diploma Curriculum, each divided into four semesters of two academic sessions each (four academic sessions, altogether). The objective of the National Diploma (ND) programme in Library and Information Science is producing the nation's library and information science technicians who will be capable of performing middle level functions in libraries. The curriculum is structured into three main components: General Studies (GS), Professional Courses (LIS core) and SIWES (Industrial Attachment). The supervised Industrial Work Experience Scheme (SIWES) is 4 months. The curriculum also has coursework, examinations, practical works, and a final project.

The NBTE LIS curriculum is targeted at ensuring that, on completion of this course, the diplomate will be able to (a) classify and catalogue books; (b) process journals and other reference materials; (c) compile some general and specific subject bibliographies, indexes and abstracts; (d) perform readers' services with minimum supervision; (e) supervise junior (clerical and non-technical) staff in a library; (f) take charge of a school or community library efficiently and effectively; (g) utilize information and communication technologies (ICT) in information handling and processing. The structure of the programme consists of four semesters of classroom, laboratory and workshop activities in the institution and a semester (3-4 months) of Supervised Industrial Work Experience Scheme (SIWES). Each semester shall be of 17 weeks duration made up as follows: 15 contact weeks of teaching and practical exercises, and two weeks for registration and examinations (NBTE, 2020).

Meanwhile, according to National Board for Technical Education (2020), the Higher National Diploma (HND) programme in Library and Information Science is designed to produce diplomates with the knowledge and skills to actively participate in the provision of efficient library and information services to meet the diverse information needs of the society. On completion of this course, the diplomates will be able to carry out the following functions:

a) Select, acquire and process library and information resource without or with minimum supervision; b) Compile general, Subject and Analytical Bibliographies, Indexes and Abstracts; c) Effectively and efficiently use Information and Communication Technologies (ICT) in the generation, acquisition, storage, preservation and dissemination of textual, graphic, numeric and pictorial information to meet the different information need of users; d) Supervise subordinate staff (clerical and technical) in Library and Information Centers.

e) Effectively manage medium-size libraries and information centers.

The structure of the programme consist of four semesters of classroom, laboratory and workshop activities in the college-each semester shall have 17 weeks duration made up as follows:- 15 contact weeks of teaching, i.e., recitation, practical exercises, quizzes, test, etc.; and 2 weeks for examinations and registration.

Saka and Dawha (2021) averred that unlike 20th century librarianship when employment was confined to the four walls of libraries with the provision of traditional core library services, the 21st century library schools maintains a designed curriculum that prepares prospective Library and Information Science and Library and Information Technology (LIS/LIT) graduates and information professionals for employment opportunities in organizations other than libraries. These include organisations exploring the potentials of the digital revolution to discharge their information-related statutory responsibilities. Similarly, Malik and Ameen (2017) conducted a survey titled "Library/information education programmes in Pakistan: a comparison with IFLA Guidelines". The study, based on a documentary analysis and telephonic interviews with master's programs' coordinators of all LIS departments, revealed that while there is some compliance with IFLA core elements, the courses are largely inclined toward the management of libraries and less toward the information communication technologies (ICTs) components. Generally, the courses were traditional in nature, indicating a problem of widespread reliance on outdated and some irrelevant contents that do not reflect the current needs of the changing environment (Malik & Ameen, 2017). This revelation implies that there is a need for increased efforts towards seeking alignment with international standards by redesigning and reorienting LIS curricula.

In the Nigerian context, Saka and Dawha (2021) emphasised that there are some gaps to be filled in the Library and Information Science Education (LISE) in Nigeria, as library schools have to carry the regulatory bodies along in matters of establishment of Library Schools, curriculum design and review, admission requirements and appropriate institutions to run diploma programme. This is a call for an efficient and robust synergy between regulatory bodies, on behalf of government, and Library and Information Schools. Unfortunately, close to nothing has been reported in literature concerning the weighing of the current LIS curriculum for NBTE-regulated LIS schools in Nigeria, against a global recommended guideline such as the IFLA Foundational Knowledge Areas (FKAs). This gap in literature justifies the need for the current study.

Theoretical Framework

This study is anchored on the Curriculum Alignment Theory developed by John Biggs (1996), specifically his concept of Constructive Alignment**.** The Constructive Alignment Theory is an educational theory that emphasizes the systematic alignment of curriculum objectives, learning outcomes, teaching activities, and assessment processes to ensure that students acquire the intended knowledge and competencies.

According to Biggs (1996), curriculum effectiveness depends on the degree of consistency between:

- Intended learning outcomes;
- Curriculum content;
- Teaching and learning activities; and
- Assessment methods.

The theory assumes that meaningful learning occurs when all curriculum components are aligned with predetermined competencies and standards. In curriculum evaluation studies, Constructive Alignment Theory is frequently used to determine whether educational programmes adequately reflect professional standards, competency frameworks, or accreditation requirements.

The present study seeks to determine the extent to which the NBTE Library and Information Science curriculum corresponds with the competencies prescribed by the IFLA Foundational Knowledge Areas. The IFLA FKAs represent internationally recognized standards for LIS education and serve as the benchmark against which the NBTE curriculum is evaluated.

Using Constructive Alignment Theory, the study examines whether:

i. The content of the NBTE LIS curriculum reflects the knowledge domains specified by IFLA;
ii. The curriculum provides adequate coverage of internationally recognized LIS competencies;
iii. There are gaps between curriculum content and professional expectations;
iv. Certain knowledge areas are overemphasized or underrepresented; and
v. The curriculum incorporates additional contextual competencies relevant to the Nigerian environment.

The theory is relevant to this study because it provides a framework for evaluating the degree of correspondence between the National Board for Technical Education (NBTE) Library and Information Science curriculum and the International Federation of Library Associations and Institutions (IFLA) Foundational Knowledge Areas. By comparing curriculum content and learning outcomes with internationally recognized LIS competencies, the study assesses the extent of alignment, identifies existing gaps, and determines areas requiring curriculum enhancement. Consequently, Constructive Alignment Theory provides an appropriate lens for examining the adequacy, relevance, and global responsiveness of the NBTE LIS curriculum. Thus, the theory provides a framework for assessing the congruence between national curriculum content and global professional standards.

Methodology

The study adopted a documentary research design employing qualitative content analysis and quantitative curriculum mapping techniques. A qualitative content analysis is a flexible systematic research method used to describe, interpret, and categorize textual, visual, or audio data, identifying underlying patterns, themes, and meanings (both manifest and latent) rather than just counting word frequencies (Lindgrem, Lundman, & Graneheim, 2020; Ivankova, 2023). It also involves dividing data into manageable chunks, coding these chunks, and finally grouping the codes into categories that reflect patterns found across the data set used in the study (Bohm & Sundqvist, 2025). Meanwhile, curriculum mapping techniques are described as systematic, visual methods used to align, document, and analyze academic course content (Okojie, Bastas, & Miralay, 2022). Rowla, Bowen, Murk, and Hong (2017) state that by visualizing and diagramming learning outcomes, assessments, and instructional materials, educators can identify and eliminate learning gaps, prevent redundant instruction, and ensure logical progression across grade levels or degree programmes.

The design was considered appropriate because the study relied on the systematic examination of documentary sources rather than data collected from respondents through questionnaires, interviews, or observations. The design is suitable for the current study as the study relies entirely on documentary evidence obtained from the International Federation of Library Associations and Institutions (IFLA) Foundational Knowledge Areas (FKAs) and the National Board for Technical Education (NBTE) Library and Information Science (LIS) curriculum. The approach enabled a systematic comparison between internationally recognized LIS knowledge domains and the curriculum content prescribed for National Diploma (ND) and Higher National Diploma (HND) programmes in Nigeria. This implies that documentary sources were the major instruments for data collection. Data for the study were obtained from two primary documentary sources:

i. The IFLA Foundational Knowledge Areas (FKAs), which specify the core knowledge domains and competencies expected of LIS education programmes globally.
ii. The National Board for Technical Education (NBTE) Curriculum for Library and Information Science (2020), including:
    - Programme structure;
    - Course titles;
    - Course descriptions;
    - Learning outcomes; and
    - Curriculum content for ND and HND programmes.

These documents constituted the corpus of analysis for the study.

The researchers extracted all curriculum components relevant to Library and Information Science from the NBTE curriculum document and compiled them semester-by-semester for both National Diploma and Higher National Diploma programmes. Similarly, the eight IFLA Foundational Knowledge Areas and their associated competencies were extracted from the IFLA Guidelines for Professional Library and Information Science Education Programmes (Chu et al, 2020). The extracted information was organized into comparative matrices to facilitate curriculum mapping and content analysis.

To determine the extent of alignment, a curriculum mapping matrix was developed in which each NBTE LIS course was mapped against the eight IFLA Foundational Knowledge Areas. Each course was coded using a three-point relevance scale alongside each of the eight (8) IFLA FKAs:

Table 1: Rating of course relevance to IFLA FKAs

Score	Interpretation
0	Not represented/No evidence of alignment
1	Slightly represented/Low alignment
2	Moderately represented/Moderate alignment
3	Strongly represented/Strong alignment

The coding was based on the course title, content, objectives, and learning outcomes.

For each FKA:

1. Courses with scores of 1, 2, or 3 were identified as mapped courses.
2. The total score obtained for all mapped courses was computed.
3. The maximum obtainable score was calculated as:

Maximum Score = (Number of Mapped Courses) ×3

4. The alignment percentage was determined using:

Alignment Percentage = Total Score Obtained/Maximum Obtainable Score ×100

$$\text{Alignment (\%)} = \frac{\text{Total FKA Score}}{\text{Number of Courses Mapped} \times 3} \times 100$$

Where:

- Total FKA Score = sum of all coding scores for the FKA
- Number of Courses Mapped = courses with score ≥ 1
- 3 = maximum score per course

The resulting percentages were interpreted using the benchmark:

Table2: Percentage rating of alignment

Percentage Range	Interpretation
0–24%	Low Alignment
25–49%	Moderate Alignment
50–74%	High Alignment
75–100%	Very High Alignment

Total curriculum alignment was computed by aggregating all FKA scores and maximum obtainable scores:

$$\text{Alignment} = \frac{\sum \text{Total Scores}}{\sum \text{Maximum Scores}} \times 100$$

To identify knowledge areas and competencies emphasized in IFLA FKAs but underrepresented or absent in the NBTE LIS curriculum, gap analysis was conducted by deducting the percentage of extent of alignment from the total alignment percentage (100%). This helps to identify at a glance, the deviation of NBTE curriculum from IFLA FKAs, since the alignment is established by an earlier mapping of existing NBTE courses with IFLA FKAs.

Meanwhile, a comparative content analysis was used to identify indigenous, contextual, or regulatory components of the NBTE LIS curriculum that are not explicitly captured in the IFLA FKAs. The analysis of the implications of identified gaps and overlaps for the quality, relevance, and global competitiveness of LIS graduates in Nigeria was done based on evidence-based framework from the identified gaps compared to the stated global competencies expected of contemporary Library and Information Scientists in contemporary literature.

Table 3: Summary of Analytical Techniques by Objective

Objective	Analytical Technique
Objective 1	Documentary Analysis of IFLA FKAs
Objective 2	Documentary Analysis of NBTE Curriculum Structure, Content, and Learning Outcomes
Objective 3	Curriculum Mapping and Alignment Analysis
Objective 4	Gap Analysis
Objective 5	Comparative Content Analysis
Objective 6	Evidence-Based Recommendation Framework

Data Analysis and Discussion of Findings

The Core Foundational Knowledge Areas (FKAs) Prescribed by IFLA

The 8 Foundational Areas of IFLA include Information in Society; Foundations of the LIS Profession; Information and Communication Technologies; Research and Innovation; Information Resources Management; Management for Information Professionals; Information Needs and User Services; Literacies and Learning (Source: Chu, et al (2022). *IFLA Guidelines for Professional Library and Information Science (LIS) Education Programmes.*

Table 4: Foundational Knowledge Areas (FKAs) in LIS and Core Subjects

FKA	Foundational Knowledge Area	Description	Core Subjects / Course Areas
FKA 1	*Information in Society*	Explores the role, value, and impact of information within social, cultural, economic, and political contexts, including ethical and legal considerations.	Information Society, Information Policy, Freedom of Information, Intellectual Property, Ethics in LIS, Digital Divide
FKA 2	*Foundations of the LIS Profession*	Examines the history, philosophy, principles, and professional ethics guiding library and information science practice.	Introduction to LIS, History of Libraries, Professional Ethics, Professional Issues in LIS, Role of Libraries in Development
FKA 3	*Information and Communication Technologies*	Focuses on the application of ICT tools and systems in the creation, organization, storage, and dissemination of information.	ICT in Libraries, Library Automation, Database Management, Networking, Digital Libraries, Institutional Repositories, Web Development, Database Management, Advanced Digital Librarianship and Data Management, Management Information Systems, Information Architecture and User Experience, Information Assurance and Security
FKA 4	*Research and Innovation*	Emphasizes research methods, critical inquiry, and innovative practices for advancing knowledge and solving problems in LIS.	Research Methods, Statistics, Bibliometrics, Data Analysis, Innovation in LIS, Scholarly Communication
FKA 5	*Information Resources Management*	Covers the selection, acquisition, organization, preservation, and management of information resources in various formats.	Collection Development, Cataloguing, Classification, Indexing, Metadata, Preservation and Conservation
FKA 6	*Management for Information Professionals*	Focuses on administrative and managerial competencies required for effective leadership of libraries and information centers.	Library Management, Human Resource Management, Strategic Planning, Financial Management, Project Management
FKA 7	*Information Needs and User Services*	Deals with understanding user information needs and providing appropriate services to meet those needs effectively, with particular consideration of EDIA (Equity, Diversity, Inclusion and Accessibility).	Reference Services, Information Services, User Studies, Information Literacy, Community Information Services, Innovative Inclusive Information Services
FKA 8	*Literacies and Learning*	Focuses on developing users' competencies in information, digital, and media literacy, as well as supporting lifelong learning.	Information Literacy, Digital Literacy, Media Literacy, User Education, Lifelong Learning, Instructional Design

Document analysis revealed that the IFLA FKAs articulate a broad, competency-based framework designed to guide LIS education globally. The core FKAs identified include: Information and Knowledge Organisation, Information Access, Retrieval, and Discovery, Digital Technologies and Digital Environments, Research Methods and Evidence-Based Practice, Information Ethics, Policy, and Legal Issues, Management and Leadership of Information Services, User Services, Information Literacy, and Learning Support, Cultural Heritage, Preservation, and Memory Institutions, Communication, Advocacy, and Professional Values, and Lifelong Learning and Continuing Professional Development. These knowledge areas emphasise professional adaptability, digital competence, ethical responsibility, research capacity, and user-centred service delivery.

The Structure, Content, and Learning Outcomes of the NBTE LIS Curriculum

Table 5: Structure of NBTE Curriculum for LIS

SN	National Diploma (ND)	Higher National Diploma (HND)

Table 7: Learning Outcomes of NBTE Curriculum for National Diploma and Higher National Diploma in Library and Information Science

SN	National Diploma (ND)	Higher National Diploma(HND)
A	Classify and catalogue books	Select, acquire and process library and information resource without or with minimum supervision
B	Process journals and other reference materials;	Compile general, Subject and Analytical Bibliographies, Indexes and Abstracts
C	Compile some general and specific subject bibliographies, indexes and abstracts	Effectively and efficiently use Information and Communication Technologies (ICT) in the generation, acquisition, storage, preservation and dissemination of textual, graphic, numeric and pictorial information to meet the different information need of users
D	Perform readers' services with minimum supervision	Supervise subordinate staff (clerical and technical) in Library and Information Centers
E	Supervise junior (clerical and non-technical) staff in a library	Effectively manage medium-size libraries and information centers
F	Take charge of a school or community library efficiently and effectively	
G	Utilize Information and Communication Technologies (ICT) in information handling and processing	

Source: National Board for Technical Education (2020).

Analysis of the NBTE LIS curriculum showed that it is structured into ND and HND levels, with a strong emphasis on Foundations of librarianship, Cataloguing and classification, Collection development, Reference and information services, Library routines and operations, ICT applications in libraries, and Industrial training (SIWES)

Learning outcomes are largely skill-based and practice-oriented, reflecting NBTE's mandate to produce technically competent middle-level manpower. The curriculum also incorporates general studies courses, entrepreneurship education, and supervised industrial training.

The extent of alignment between IFLA FKAs and the NBTE LIS Curriculum

FKA Alignment Formula:

$$\text{Alignment (\%)} = \frac{\text{Total FKA Score}}{\text{Number of Courses Mapped} \times 3} \times 100$$

Where:

- Total FKA Score = sum of all coding scores for the FKA
- Number of Courses Mapped = courses with score ≥ 1
- 3 = maximum score per course

Table 8: Extent of alignment rating scores for IFLA FKA mapped courses

Score	Interpretation
0	Not represented/No evidence of alignment
1	Slightly represented/Low alignment
2	Moderately represented/Moderate alignment
3	Strongly represented/Strong alignment

Table 9: Percentage of alignment rating scores

Percentage Range	Interpretation
0–24%	Low Alignment
25–49%	Moderate Alignment
50–74%	High Alignment
75–100%	Very High Alignment

Table 9: FKA Total score and Course Counts

FKA	Total Score	Courses Mapped
FKA1 Information in Society	56	33
FKA2 Foundations of LIS Profession	51	37
FKA3 ICT	29	17
FKA4 Research & Innovation	32	20
FKA5 Information Resources Management	102	52
FKA6 Management for Information Professionals	34	23
FKA7 Information Needs & User Services	55	34
FKA8 Literacies & Learning	38	34

Explanation: A course was considered mapped to an FKA if it received a score of **1, 2, or 3** under the particular FKA. For instance, the total score for FKA1 (Information in Society) was obtained by summing all coding scores assigned to courses mapped to the knowledge area. Thirty-three courses were identified as contributing to FKA1 (Information Society), yielding a cumulative score of 56. The score was derived by adding the individual coding values assigned during the curriculum mapping exercise. This total score was subsequently used to compute the alignment percentage for FKA1.

For data transparency, the tables below (in **Table 10** to **Table 17**) explain the coding matrix used for each FKA, as reflected in **Table 9** above:

Total score	397		750		

General Curriculum Alignment

Using the mapped-course normalization approach:

General alignment: $\frac{\Sigma \text{ Total Scores}}{\Sigma \text{ Maximum scores obtainable}} * 100$

Total number of scores obtained by each FKA: 56 +51 + 29 + 32 + 102 + 34 + 55 + 38 = 397

Total (Maximum) number of obtainable scores by each FKA: 99 + 111 + 51 + 60 + 156 + 69 + 102 + 102 = 750

397/750 * 100 = 52.93

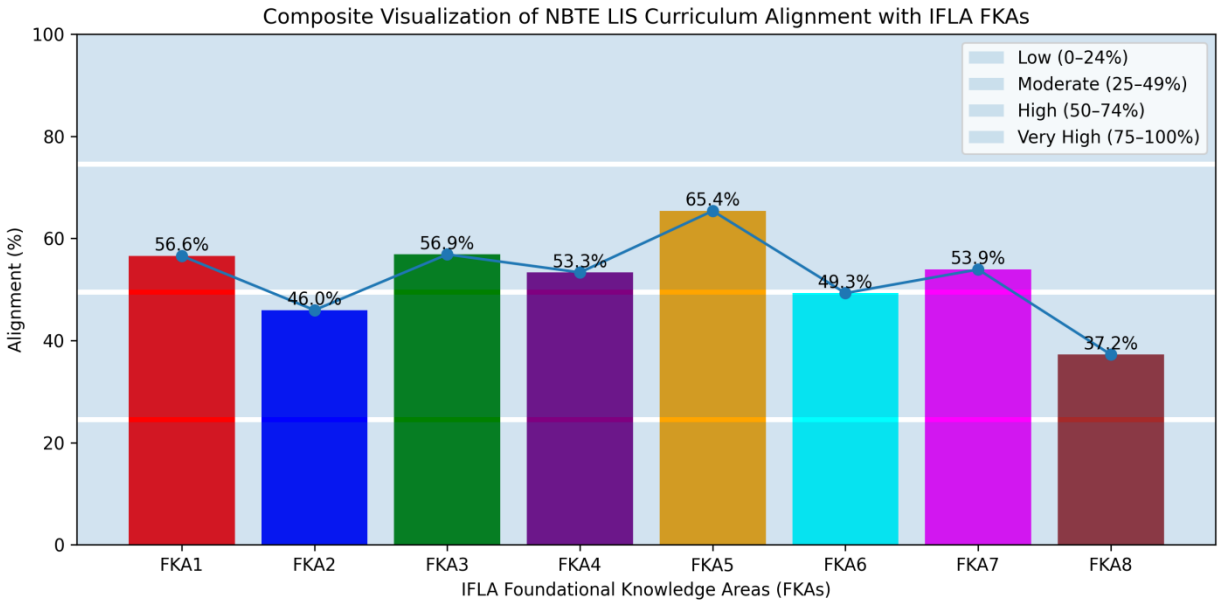

Fig 2: Composite Visualisation of NBTE Curriculum Alignment with IFLA FKAs

The general alignment between the NBTE LIS curriculum and the IFLA Foundational Knowledge Areas was determined using the mapped-course normalization approach. The cumulative score obtained across the eight FKAs was 397, while the total maximum obtainable score was 750. Applying the alignment formula yielded a general alignment score of 52.93%. This indicates a high level of alignment between the NBTE LIS curriculum and the IFLA FKAs, suggesting that the curriculum substantially incorporates internationally recognized LIS knowledge areas while still presenting opportunities for strengthening underrepresented competencies in management, literacies and learning, and professional foundations.

The analysis revealed that the NBTE LIS curriculum demonstrates a cumulative alignment of 52.93% with the IFLA Foundational Knowledge Areas, indicating a generally high level of correspondence with international LIS education standards. Information Resources Management recorded the highest alignment score (65.4%), reflecting the curriculum's strong emphasis on cataloguing, classification, collection development, preservation, indexing, archives, and records management. Information and Communication Technologies (56.9%), Information in Society (56.6%), Research and Innovation (53.3%), and Information Needs and User Services (53.9%) also demonstrated high levels of alignment.

Conversely, Foundations of the LIS Profession (46.0%), Management for Information Professionals (49.3%), and Literacies and Learning (37.25%) recorded moderate levels of alignment. The relatively lower representation of Literacies and Learning suggests limited emphasis on instructional design, digital literacy pedagogy, media literacy, and lifelong learning competencies. In summary, the findings indicate that while the NBTE LIS curriculum aligns substantially with the IFLA FKAs, opportunities remain for strengthening professional foundations, strategic management competencies, and literacy-related learning outcomes. These findings conform to the findings of Malik and Ameen (2017) who compared the LIS curriculum in Pakistan with IFLA guidelines also revealed that the courses were traditional in nature, indicating a problem of widespread reliance on outdated and some irrelevant contents that do not reflect the current needs of the changing digitally-driven knowledge economy and information environment. These findings are also in tandem with the findings of Ismail and Khan (2021) indicating that the present LIS curricula and training programmes in the country (Pakistan) do not adequately meet the present job market needs due to insufficient educational resources, a dearth of suitable ICT related contents in the courses among others such as inadequate industrial attachment. In the current study, the use of SIWES (Student Industrial Experience Scheme) is a compulsory industrial attachment, which shows that NBTE-regulated LIS schools in Nigeria are given adequate opportunities to engage with the industry for practical experience, in contrast to university systems.

The findings revealed that the NBTE Library and Information Science curriculum achieved a total alignment score of 52.93% with the IFLA Foundational Knowledge Areas. This finding supports the propositions of Constructive Alignment Theory (Biggs, 1996), which emphasizes the need for coherence between curriculum content and intended professional competencies. The moderate level of alignment suggests that the NBTE curriculum incorporates many of the knowledge domains required by international LIS standards, particularly in Information Resources Management and Information Needs and User Services. However, the alignment is not complete, indicating that some intended competencies within the IFLA framework are not adequately reflected in the curriculum. From the perspective of Constructive Alignment Theory, this implies that the curriculum only partially achieves congruence with the professional outcomes expected of contemporary LIS education.

IFLA FKAs underrepresented or absent in the NBTE LIS Curriculum

The chart and table below ranks the FKAs according to their **curriculum gap score**, calculated as:

Total Expected Alignment Percentage: 100%. Thus, higher values indicate larger gaps and greater need for curriculum enhancement.

Table 20: Gap Analysis of NBTE LIS Curriculum Relative to IFLA FKAs

IFLA FKA	Alignment (%)	Gap (%)
FKA1 Information in Society	56.57	43.43
FKA2 Foundations of LIS Profession	45.95	54.05
FKA3 ICT	56.86	43.14
FKA4 Research & Innovation	53.33	46.67
FKA5 Information Resources Management	65.38	34.62
FKA6 Management for Information Professionals	49.28	50.72
FKA7 Information Needs & User Services	53.92	46.08
FKA8 Literacies & Learning	37.25	62.75

Higher gap percentages indicate greater underrepresentation of IFLA competencies within the NBTE LIS curriculum.

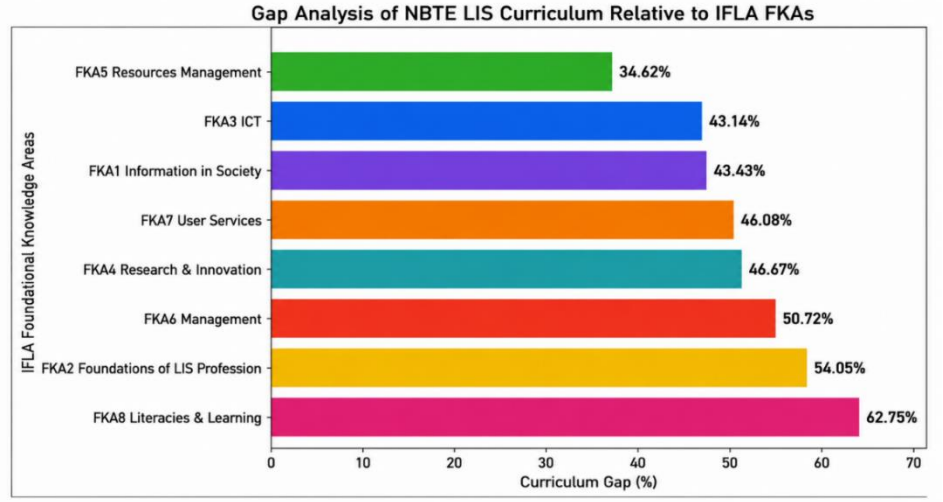

Fig 3: Gap Analysis of NBTE Curriculum Relative to IFLA FKAs

The table and chart above show that FKA8 (Literacies and Learning) exhibits the largest curriculum gap (62.75%), indicating that competencies relating to digital literacy, media literacy, data literacy, instructional design, lifelong learning, and teaching skills are insufficiently represented within the NBTE LIS curriculum. The second-largest gap occurs in FKA2 (Foundations of the LIS Profession) with a gap score of 54.05%, suggesting inadequate emphasis on professional ethics, professional identity, international professional standards, and emerging professional competencies. FKA6 (Management for Information Professionals) also records a substantial gap (50.72%), indicating weak coverage of strategic leadership, innovation management, project management, organizational change, and performance management. This is a major challenge that technological innovations have led to an increase in demand for pedagogical skills on the part of library and information science professionals for them to empower users with knowledge and skills to navigate the complex digital information ecosystem. While foundational aspects are present, advanced competencies such as digital literacy instruction, lifelong learning facilitation, strategic leadership, and innovation management are not adequately developed across the curriculum. These areas, where present, were often treated implicitly or embedded within other courses rather than addressed as standalone competencies. This also aligns with the findings of Chisunka and Nsibirwa (2026) who revealed that there are no explicit AI components in the LIS Master's programmes of two universities studied, even at higher levels in Zambia and South Africa, implying the need for integration of explicit Artificial Intelligence in LIS in African LIS schools.

Moderate gaps are observed in FKA4 (Research and Innovation) (46.67%), FKA7 (Information Needs and User Services) (46.08%), FKA1 (Information in Society) (43.43%), and FKA3 (ICT) (43.14%). This suggests limited emphasis on competencies such as evidence-based practice, data analysis, information policy, and the socio-political dimensions of information. The analysis revealed that Information Architecture and Information Assurance, including competencies related to cybersecurity, privacy protection, digital risk management, and information security governance, is not explicitly represented in the NBTE LIS curriculum. This gap suggests that graduates may possess basic ICT competencies but may be inadequately prepared to address contemporary challenges relating to information security, data protection, and digital trust in modern information environments. The smallest gap is found in FKA5 (Information Resources Management) (34.62%), confirming that the NBTE curriculum is strongest in traditional librarianship functions such as cataloguing, classification, collection development, indexing, archives, preservation, and records management. This is corroborated by Krishnamurty (2020) who noted that most of the fresh graduates, having been introduced to the latest developments in information communication technology applications through their revised library science curriculum in India have the advantage over other experienced professionals who went through traditional library training in that they have a basic idea about the advancements in ICT.

Based on the gap analysis, the most underrepresented IFLA competency domains in the NBTE LIS curriculum are Literacies and Learning (FKA8), Foundations of the LIS Profession (FKA2), and Management for Information Professionals (FKA6). These areas should receive priority attention during future curriculum review and revision exercises to improve alignment with international LIS education standards.

The above findings imply that the NBTE LIS curriculum is heavily oriented toward traditional technical competencies, with insufficient emphasis on research, innovation, policy, and emerging professional skills required in contemporary information environments. In conformity with the above findings, Olubiyo (2022b) noted that the challenges presented by current forces in the labour market demand that LIS schools' curriculum content in Africa should be reviewed with the aim of equipping their graduates with the knowledge and skills that would enable them succeed in the ever changing world of information. This was evidently reported in a survey of the perspectives of LIS school alumni who now practice in various information profession on the knowledge, skills and abilities of LIS professionals in the digital era, as reported by Yadav (2021), affirming that computing skills, library automation and library digitization are considered absolutely essential for contemporary LIS in practice.

The identification of significant gaps within FKA8 (Literacies and Learning), FKA2 (Foundations of the LIS Profession), and FKA6 (Management for Information Professionals) further illustrates the relevance of Constructive Alignment Theory. According to Biggs (1996), effective curricula should ensure that learning experiences and content adequately support the competencies expected of graduates. The underrepresentation of competencies such as digital literacy, media literacy, strategic leadership, innovation management, professional ethics, and lifelong learning indicates areas where alignment between curriculum content and international professional expectations is weak. Consequently, the findings suggest that the curriculum does not fully support the development of certain competencies required in contemporary information environments, thereby limiting the extent of constructive alignment.

Indigenous, contextual, or regulatory components of the NBTE LIS curriculum that are not explicitly captured in the IFLA FKAs.

Based on the comparative content analysis between the NBTE Library and Information Science (LIS) Curriculum (2020) and the IFLA Foundational Knowledge Areas (FKAs), several components of the NBTE curriculum were found to be indigenous, contextual, or regulatory in nature and are not explicitly represented within the IFLA FKAs**.** These components reflect Nigeria's socio-cultural realities, educational policies, labour market needs, and national development priorities.

Table 21: Indigenous, Contextual, and Regulatory Components Unique to the NBTE LIS Curriculum

Component	Type	Evidence in NBTE Curriculum	Presence in IFLA FKAs	Significance
Oral Archives and Indigenous Knowledge (LIS 326)	Indigenous	Dedicated HND course	Not explicitly stated	Strong representation of preservation of indigenous knowledge systems, oral traditions, and cultural heritage
Students' Industrial Work Experience Scheme (SIWES)	Regulatory/Contextual	Mandatory industrial attachment	Not specified	Provides practical workplace experience and employability skills
Citizenship Education I & II (GNS 127, GNS 121/128)	Regulatory	General studies requirement	Not included	Promotes national consciousness, civic responsibility, and citizenship values
Basic French I & II (GNS 111, GNS 122)	Contextual	Language requirement	Not included	Enhances communication with West African Francophone neighbours and international collaboration
Entrepreneurship Education (EED 126, EED 323, EED 413)	Contextual	Entrepreneurship courses at ND and HND levels	Limited emphasis	Promotes self-employment and entrepreneurial skills
Public Relations in Libraries (LIS 128)	Contextual	Stand-alone course	Indirectly implied	Enhances community engagement and library visibility
Library Advocacy and Marketing (LIS 410)	Contextual	Dedicated HND course	Not explicitly represented	Supports advocacy for libraries and information services
Perspectives and Opportunities in LIS (LIS 129)	Contextual	LIS-related Career-oriented course	Not explicitly represented	Introduces employment and professional opportunities in LIS in Nigeria
Publishing and Infopreneurship (LIS 329)	Contextual	Specialized course	Partially covered	Encourages information entrepreneurship and publishing ventures
Oral Communication and Literary Appreciation (GNS 413)	Contextual	General studies component	Not included	Strengthens communication and presentation skills
National Libraries (LIS 422)	Contextual/Regulatory	Dedicated course	Not explicitly represented	Addresses national information policies and functions of national libraries
International and Comparative Librarianship (LIS 425)	Contextual	Comparative focus	Partially represented	Examines differences among library systems and professional practices

Indigenous Components

The most significant indigenous component identified is Oral Archives and Indigenous Knowledge (LIS 326). While the IFLA FKAs emphasize information resources, knowledge organization, and cultural heritage preservation, they do not explicitly address African indigenous knowledge systems or oral traditions. This course reflects Nigeria's cultural context by focusing on Indigenous knowledge preservation, Oral history documentation, Traditional knowledge management, Community memory institutions, and Cultural heritage conservation. Its inclusion demonstrates an effort to make LIS education responsive to local realities while preserving valuable indigenous knowledge resources.

Contextual Components

Several courses were designed to address local socio-economic and professional realities rather than international competency frameworks.

Entrepreneurship Education

The inclusion of Entrepreneurship Education at both ND and HND levels reflects Nigerian government policy aimed at reducing graduate unemployment and promoting self-reliance. The IFLA FKAs do not explicitly require entrepreneurship training. Therefore, the NBTE curriculum extends beyond traditional LIS competencies by preparing graduates for Information consultancy, Publishing ventures, Information brokerage, Knowledge entrepreneurship, and self-employment opportunities.

Library Advocacy and Marketing

The NBTE curriculum recognizes the need for librarians to advocate for funding, visibility, and public support. Consequently, courses such as Library Advocacy and Marketing and Public Relations in Libraries were introduced. These competencies are particularly relevant in developing countries where libraries often face challenges related to funding and public awareness.

Regulatory Components

The NBTE curriculum incorporates several elements that arise from national educational regulations rather than professional LIS standards.

Students' Industrial Work Experience Scheme (SIWES)

SIWES is a mandatory component of Nigerian tertiary education regulated by national policy. Unlike the IFLA FKAs, which focus primarily on knowledge and competencies, SIWES emphasizes workplace experience, professional exposure, practical skills development, Industry-academia linkage, and employability enhancement. This component significantly strengthens the practical orientation of the curriculum. This position was emphasised in a study by Okonoko, Abubakar and Udoh (2023) who revealed that students need practical work training through internships among others in order to assist the students to build their own competitiveness.

Citizenship Education

Citizenship Education courses are compulsory under Nigerian higher education policy. Their objectives include national integration and cohesion, civic responsibility, democratic values, national development awareness, and responsible citizenship. These objectives fall outside the scope of the IFLA FKAs and therefore constitute a uniquely regulatory component of the curriculum.

Basic French Language

The inclusion of Basic French reflects Nigeria's geopolitical position within West Africa, where many neighbouring countries are French-speaking. This requirement seeks to enhance regional communication and cooperation, a competency not specifically addressed in the IFLA framework. In support of this, Olubiyo (2022b) asserts that communication skills are essential in order to manage the information at hand and deal with users' needs. Yadav (2021) also found out that foreign languages were reported as prerequisites for working in special libraries.

Summary of Unique NBTE Components

The comparative analysis revealed that the NBTE LIS curriculum contains three broad categories of elements that are not explicitly captured by the IFLA FKAs:

1. **Indigenous Components**
    - Oral Archives and Indigenous Knowledge
2. **Contextual Components**
    - Entrepreneurship Education
    - Library Advocacy and Marketing
    - Public Relations in Libraries
    - Publishing and Infopreneurship
    - Perspectives and Opportunities in LIS
    - Basic French
3. **Regulatory Components**
    - SIWES
    - Citizenship Education
    - General Studies requirements

The presence of these components indicates that although the NBTE LIS curriculum demonstrates substantial alignment with international LIS standards, it also incorporates local, national, and regional priorities that are not explicitly reflected in the IFLA FKAs. These additions enhance the curriculum's contextual relevance by addressing indigenous knowledge preservation, employability, entrepreneurship, civic responsibility, and practical professional training. Consequently, the curriculum can be viewed as a hybrid model that combines global LIS competencies with local educational and developmental needs. The presence entrepreneurship education aligns with the goals of the Nigerian polytechnic education system, which lays emphasis on competencies for self-reliance in the labour market. This, when merged with Perspective and Opportunities in LIS will expand the scope of job opportunities for LIS graduates in institutions supervised and regulated by the NBTE.

The study also identified several indigenous, contextual, and regulatory components that are unique to the NBTE LIS curriculum and not explicitly captured within the IFLA Foundational Knowledge Areas. These include Oral Archives and Indigenous Knowledge, Entrepreneurship Education, Citizenship Education, Library Advocacy and Marketing, and SIWES. While these components may not directly correspond to international competency standards, Constructive Alignment Theory recognizes the importance of aligning curricula with intended educational outcomes and contextual realities. Therefore, the inclusion of these courses demonstrates an effort by the NBTE curriculum to respond to local socio-cultural, economic, and professional needs while complementing internationally recognized LIS competencies. This finding suggests that curriculum alignment should not be interpreted solely as conformity to global standards but also as responsiveness to national priorities and contextual demands.

Implications of the Identified Gaps and Overlaps for the Quality, Relevance, and Global Competitiveness of LIS Graduates in Nigeria

The alignment analysis between the NBTE Library and Information Science (LIS) curriculum and the IFLA Foundational Knowledge Areas (FKAs) revealed both areas of strength and areas requiring improvement. These findings have significant implications for the quality of LIS education, the relevance of graduates to contemporary professional practice, and their competitiveness within the global information environment.

Implications for the Quality of LIS Education

The findings indicate that the NBTE LIS curriculum demonstrates strong alignment with Information Resources Management (FKA5), which recorded the highest alignment score (65.38%). This suggests that graduates are likely to acquire substantial competencies in traditional librarianship functions such as cataloguing, classification, indexing, abstracting, collection development, archives management, preservation, and records management. Consequently, the curriculum provides a solid foundation in core professional practices and supports the production of graduates who are technically competent in organizing and managing information resources.

However, the relatively lower alignment scores recorded in Literacies and Learning (FKA8), Foundations of the LIS Profession (FKA2), and Management for Information Professionals (FKA6) suggest limitations in the breadth and depth of professional preparation. Modern LIS education increasingly emphasizes information literacy instruction, digital learning support, leadership, strategic planning, innovation management, and professional ethics. Limited coverage of these competencies may reduce the general quality of graduate preparation by creating an imbalance between traditional technical skills and emerging professional capabilities. This conforms to the findings of Rani and Sharma (2021) who revealed that LIS graduates were dissatisfied with employability skills due to a lack of implementation of Suitable employability skills in LIS curricula. In alliance with this position, Krishnamurty (2020) also affirmed that due to the fast changing scenario of education, LIS educators must be dynamic by equipping themselves with the knowledge and skills of the emerging technologies, so as to impart effective LIS education by making use of varied teaching methods and skills relevant to the changing context.

Furthermore, the moderate alignment in Research and Innovation (FKA4) indicates that research competencies are largely confined to Research Methods and Project courses rather than being integrated throughout the curriculum. This may weaken graduates' abilities to conduct evidence-based practice, evaluate information services, and contribute to innovation within the profession.

Implications for the Relevance of LIS Graduates

The information profession has evolved from a predominantly resource-centred discipline to one that is increasingly user-centred, technology-driven, and knowledge-based. While the curriculum demonstrates reasonable alignment with Information Needs and User Services (FKA7) and Information and Communication Technologies (FKA3), the identified gaps suggest that graduates may not be fully prepared for the rapidly changing information landscape.

The limited emphasis on data literacy, digital literacy frameworks, media literacy, learning design, information policy, information governance, information ethics in digital environments; and, information architecture, information assurance and digital scholarship may reduce the relevance of graduates in modern libraries, digital repositories, research institutions, and knowledge organisations.

Contemporary information professionals are increasingly expected to support digital learning environments, manage research data, facilitate digital scholarship, and deliver virtual information services. Insufficient exposure to these competencies may create a mismatch between graduate skills and employer expectations.

Additionally, the moderate alignment in management-related competencies suggests that graduates may possess operational administrative skills but may be less prepared for leadership positions requiring strategic planning, organizational change management, innovation leadership, and performance management.

Implications for Global Competitiveness

The IFLA FKAs represent internationally recognized standards for LIS education and professional preparation. Therefore, gaps between the NBTE curriculum and the FKAs have direct implications for the global competitiveness of Nigerian LIS graduates. The low alignment in FKA8 (Literacies and Learning) and moderate alignment in FKA2 (Professional Foundations) may place graduates at a disadvantage when competing for international employment opportunities, postgraduate studies, professional certifications, and participation in global information initiatives.

Globally, LIS professionals are increasingly expected to demonstrate competencies in information literacy instruction, digital pedagogy, research support services, data management, Artificial Intelligence applications, Digital Curation, Open Science, Information Ethics, and Global Information Policy. The underrepresentation of these competencies may limit graduates' ability to function effectively in international professional environments and reduce the international recognition of the curriculum. Furthermore, weak emphasis on innovation and advanced research competencies may hinder graduates' capacity to contribute to global knowledge production and emerging areas of professional practice. This probably may be as a result of the confinement of graduates of NBTE-regulated institutions to middle level leadership roles rather than high level leadership.

Positive Implications of Contextual and Indigenous Components

Despite the identified gaps, the study also revealed several unique strengths within the NBTE curriculum. Courses such as Oral Archives and Indigenous Knowledge, Library Advocacy and Marketing, Entrepreneurship Education, Citizenship Education, and Students' Industrial Work Experience Scheme (SIWES) reflect local realities and national development priorities. These components provide graduates with contextual competencies that are not explicitly emphasized within the IFLA FKAs. The inclusion of indigenous knowledge management, in particular, strengthens graduates' ability to preserve, document, and promote African knowledge systems, thereby contributing to cultural sustainability and knowledge diversity. This is very important as studies such as Ilori, Imam, Adesanya and Adeyemi (2021), Chigwada and Ngulube (2023), Kaur (2023) and Adebayo & Adeyemo, (2017), Boyes (2025) and Lazarus, Unegbu, Opeke and Wusu (2019) have identified the critical roles that librarians play in the management of indigenous knowledge, when equipped with appropriate knowledge, skills and competencies. Similarly, entrepreneurship education and SIWES enhance employability, practical experience, and self-reliance among graduates. These contextual strengths align with the goals of establishing polytechnics and monotechnics in Nigeria, may improve graduates' relevance within the Nigerian labour market and support national development objectives.

Implications of Curriculum Overlaps

The analysis also revealed substantial overlap among courses relating to Cataloguing and Classification, Collection Development, Information Sources and Services, Library Types, Current Awareness Services, and Information Organization. While such overlaps reinforce mastery of core librarianship competencies, excessive concentration on traditional knowledge areas may reduce opportunities for introducing emerging competencies required in the digital information environment. The dominance of Information Resources Management (FKA5) suggests that curriculum space is heavily allocated to traditional professional functions. Although these remain important, curriculum review efforts may need to rebalance content to accommodate areas such as digital literacy, data management, research support, innovation, leadership, and information policy without compromising foundational competencies.

In summary, the findings suggest that the NBTE LIS curriculum possesses a strong foundation in traditional librarianship and information resource management, ensuring that graduates acquire essential professional competencies. However, significant gaps remain in areas associated with life-long learning and literacies, digital transformation, research and innovation, professional leadership. While the curriculum effectively addresses local and contextual needs through indigenous knowledge, entrepreneurship, and industrial training components, enhancing underrepresented IFLA competencies would improve the quality, relevance, employability, and global competitiveness of LIS graduates in Nigeria. Such improvements would position graduates to function effectively within both national and international information environments while preserving the curriculum's responsiveness to local realities.

Conclusion

This research work charted a course that has rarely been explored in Nigerian context, with the aim of exploring, through extant and current documentary sources, a comparative analysis of IFLA Foundational Knowledge Areas and the National Board for Technical Education Curriculum for Library and Information Science education in Nigeria. The limited availability of literature on such an important topic for the training and development of professional library and information service providers in Nigeria justifies the need for such a study at this time. While global LIS practice has become highly competitive due to the expansion of the information environment, global LIS increasingly requires

advanced competencies. The study, relying on a qualitative content analysis research design and anchored on the Constructive alignment Theory, revealed that the NBTE-regulated and supervised LIS schools in Nigeria, operate a curriculum that is heavily oriented toward traditional technical competencies, with insufficient emphasis on contemporary digital competencies and literacies, research and innovation, policy, and emerging professional skills required in highly competitive contemporary information ecosystems, even though there are evidence of local needs provisions. The findings of this study provide substantial support for Constructive Alignment Theory. The theory emphasizes the importance of ensuring consistency between curriculum content and expected professional competencies. The observed alignment between the NBTE LIS curriculum and the IFLA Foundational Knowledge Areas demonstrates that the curriculum reflects many internationally recognized standards. Nevertheless, the identified gaps indicate opportunities for further curriculum enhancement, particularly in areas relating to digital literacies, professional foundations, leadership, innovation, and information policy. At the same time, the presence of indigenous and contextual curriculum elements highlights the need to balance international best practices with local educational and developmental priorities. Therefore, the findings suggest that effective curriculum development should pursue both global relevance and contextual responsiveness. The implications of this are enormous for the quality of LIS graduates who are trained with this curriculum in terms of competency development and professional adaptability, employability, international mobility, competitiveness and visibility of LIS scholarship.

Recommendations

In the light of the findings of this study, the following are recommended:

i. Review and harmonization of the current NBTE curriculum to meet global standards, while retaining contextual and local needs. Since the last curriculum review whose product this study was based became operational (2020), emerging technologies such as blockchain technology, AI, big data, extended realities (Augmented, Mixed and Virtual realties) have become key technologies used in library services in the global North. Thus, this study underscores the need for a harmonised curriculum through a comprehensive curriculum review that aligns with global trends in innovative library and information services delivery.

ii. IFLA FKAs should provide a broader open framework, specifying not just the main FKAs, but the specific courses that are expected to be captured underneath. A wider provision of the course contents will also be vital to enable a better understanding and adaptation of the FKAs to local needs.

iii. IFLA FKAs should contain an open area for local needs, tagged Area 9, in addition to the current 8 areas in existence. This will help address local peculiar needs of library schools and regulatory bodies in different geographical locations.

iv. LIS Educators also need to be equipped with contemporary digital technology skills by undergoing robust training on emerging technology application to teaching and practice of LIS. If the students must be provided with the necessary skills for the contemporary information ecosystems, LIS educators must first acquire such skills in order to ensure efficient teaching of such competencies to students.

Abstract

The phenomenological study examined the lived experiences of professional librarians on the association deficiencies in librarianship, with a focus on governance, regulatory ambiguity, contested authority, and professional identity. The study purposively sampled twelve librarians from Nigeria's six geopolitical zones to ensure diverse perspectives. Data were collected through a focus group discussion conducted online, facilitating dynamic dialogue and collective reflection on governance, leadership, regulatory structures, and professional engagement. Audio recordings were transcribed verbatim and analysed using a thematic approach. Trustworthiness was enhanced through member checking, reflexive note-taking, and thick contextual description. Findings revealed that weak governance, leadership disconnect, overlapping mandates between the Nigerian Library Association (NLA) and the Librarians' Registration Council of Nigeria (LRCN), selective enforcement of ethical standards, and marginalisation of early-career and non-academic librarians contribute to fragmented professional identity, declining trust, and disengagement. Participants highlighted the need for transparent, merit-based leadership, clearer role demarcation, and inclusive professional engagement. The study concludes that addressing these structural and leadership deficiencies is essential for strengthening cohesion, advocacy, innovation, and the long-term sustainability of Nigerian librarianship. Therefore the study recommended that there should be a clear demarcation of responsibilities between regulatory and professional bodies, coupled with consistent enforcement of professional codes and ethical standards, which will reduce role ambiguity, contested authority, and professional insecurity.

Keywords: Nigerian librarianship, professional associations, governance, regulatory ambiguity, professional identity, trust, phenomenology

Introduction

Professional associations are widely recognised as critical institutions for regulating professional practice, shaping occupational identity, enforcing ethical standards, and advancing collective interests within society (Crafford et al., 2025). In Nigeria, established professions such as law, medicine, engineering, and accounting have historically relied on strong and clearly demarcated professional bodies to consolidate professional authority and public trust. Lawal (2025) emphaised that organisations such as the Nigerian Bar Association (NBA), the Medical and Dental Council of Nigeria (MDCN), the Council for the Regulation of Engineering in Nigeria (COREN), and the Institute of Chartered Accountants of Nigeria (ICAN) have developed relatively stable regulatory frameworks, defined professional boundaries, and institutional mechanisms for discipline and continuous professional development. Although these bodies face internal and external challenges, their professional mandates and identities remain largely coherent and widely acknowledged. In contrast, librarianship in Nigeria presents a more complex and fragmented professional landscape. Despite its foundational role in education, research, governance, and knowledge dissemination, librarianship has struggled to achieve the same level of institutional clarity and professional cohesion as other established professions (LIS Academy, 2024).

Nakaziba and Ngulube (2025) stated that librarianship operates within an environment characterised by overlapping mandates between regulatory and professional associations, contested leadership authority, limited enforcement capacity, and inconsistent engagement with practising librarians. These structural ambiguities have contributed to persistent debates regarding professional legitimacy, governance effectiveness, and the relevance of professional associations within Nigerian librarianship. Historically, the development of librarianship in Nigeria was closely tied to colonial educational structures, post-independence nation-building, and the expansion of academic and public library services. Professional associations emerged to promote standards, advocacy, and professional development; however, unlike professions such as medicine or law, librarianship has experienced recurrent institutional tensions, including disputes over regulatory authority, professional recognition, and membership obligations (Garcia & Barbour, 2018).

These challenges have intensified in the context of globalisation, digital transformation, and the increasing demand for specialised information services, thereby exposing underlying weaknesses within professional governance structures. One of the most profound consequences of these deficiencies is an emerging professional identity crisis among Nigerian librarians.

Professional identity, which encompasses shared values, roles, norms, and a sense of belonging, is essential for professional confidence and collective action (Cruess et al., 2019). In Nigerian librarianship, practitioners increasingly navigate conflicting expectations between traditional custodianship and digital innovation, between professional autonomy and institutional subordination, and between regulatory compliance and professional self-definition (Onyeisiijeh et al., 2025). Unlike other professions where professional roles and authority are clearly articulated and enforced, librarianship often appears marginalised within institutional hierarchies, thereby weakening professional self-concept and diminishing the perceived relevance of professional associations. These developments raise critical concerns that warrant systematic scholarly inquiry. Why do Nigerian librarianship Associations struggle to command legitimacy and sustained trust among their members? How do they interpret the overlapping roles and perceived deficiencies of their professional bodies? In what ways has the absence of a unified professional identity affected professional practice, cohesion, and ethical accountability? Why has librarianship, despite its strategic importance to national development, failed to achieve the level of professional clarity and authority evident in other Nigerian professions?

More fundamentally, how do these institutional and identity-related challenges shape the everyday experiences of practising librarians? Therefore, addressing these questions requires moving beyond formal policy analysis and organisational documentation to engage directly with the lived experiences of librarians themselves. Professional association deficiencies are not merely structural problems; they are experienced subjectively, negotiated socially, and interpreted emotionally within daily professional practice. Accordingly, this study adopts a phenomenological approach to explore librarians' lived experiences of professional association deficiencies in Nigeria, with the specific objectives to;

1. explore librarians' lived experiences of professional association governance and regulatory deficiencies within the Nigerian librarianship landscape;
2. examine how librarians perceive overlapping roles between professional and regulatory bodies in Nigerian librarianship; and

analyse the implications of librarians' lived experiences of professional association deficiencies for future development of librarianship in Nigeria,

Literature Review

Professional associations serve as critical mechanisms for regulating practice, shaping professional identity, and safeguarding occupational standards (Crafford et al., 2025). In librarianship, these bodies are expected to provide leadership, ensure ethical compliance, and foster professional development. However, empirical studies within the Nigerian context reveal persistent governance deficiencies that directly affect librarians' lived experiences. Saleh and Sagem (2019) and Igiamoh and Emwanta (2016) found that many Nigerian librarians perceive their professional associations as weak in accountability, transparency, and responsiveness to members' needs. Similarly, Anaeche (2025), in a survey of perception of leadership style and its impact on employees' job satisfaction and professional development in Nigerian private universities, reported widespread dissatisfaction with leadership effectiveness and decision-making processes within professional bodies. These findings suggest that governance challenges are not abstract institutional problems but are experienced subjectively by librarians in ways that shape their professional outlook and engagement. Building on these findings, Eklund (2022) empirically demonstrated that ineffective governance structures contribute to feelings of exclusion and marginalisation among practising librarians. The study revealed that librarians often experience professional associations as distant and elitist, reinforcing perceptions of institutional disconnect. Such lived experiences form the basis for how librarians interpret authority, legitimacy, and professional value, thereby linking governance deficiencies directly to broader professional challenges within the Nigerian librarianship landscape.

Closely related to governance deficiencies is the problem of role ambiguity and overlapping mandates among professional and regulatory bodies in Nigerian librarianship. Unlike professions such as law and medicine, where the functions of regulatory councils and professional associations are relatively distinct, librarianship in Nigeria has been characterised by blurred institutional boundaries (Yaya & Adeeko, 2015; Ogunmodede & Nwalo, 2015). Empirical evidence indicates that this ambiguity generates confusion among practitioners regarding compliance, allegiance, and professional authority. Omotoso and Igiamoh (2016) and Ayo (2023) reported that librarians often struggle to differentiate between regulatory enforcement and professional advocacy, leading to perceptions of power struggles rather than collaborative governance. This contested authority has significant experiential consequences. Librarians report uncertainty about whose directives carry professional legitimacy and how professional standards should be interpreted in practice (Hansson, 2017). Abbott's (1988) theory of professional jurisdiction suggests that unresolved boundary disputes weaken professional coherence and authority. In the Nigerian context, such disputes intensify

practitioners' frustration and erode confidence in professional institutions, thereby creating fertile ground for identity-related tensions.

Professional identity is constructed through shared values, institutional recognition, and sustained professional socialisation (Fitzgerald, 2020). When professional associations fail to provide clarity, recognition, and support, practitioners are likely to experience identity fragmentation. Few empirical studies in Nigeria increasingly point to an emerging identity crisis among librarians. Merga (2019) reported that many librarians perceive their profession as undervalued and poorly represented, particularly when compared with other established professions. This perception is reinforced by Vassilakaki and Moniarou-Papaconstantinou (2015), whose study found that librarians often occupy ambiguous roles within their institutions, oscillating between academic support staff and information technologists without clear professional recognition. Such identity instability weakens professional confidence and sense of belonging. Unlike professions where associations actively reinforce identity through licensing, public advocacy, and disciplinary authority, Nigerian librarianship lacks strong institutional mechanisms for identity consolidation (Ossai-Ugbah, 2013). As a result, professional association deficiencies become internalised as personal uncertainty and diminished professional pride. This identity crisis does not exist in isolation but directly influences librarians' willingness to engage with professional bodies, thereby linking identity erosion to declining participation and trust.

Trust is a foundational element of professional association effectiveness, influencing members' commitment, participation, and compliance (Liew, 2024). Nigerian empirical studies consistently demonstrate a decline in librarians' trust in professional associations. Hansson (2017) observed that many librarians engage with professional bodies primarily for credentialing or compulsory requirements rather than genuine professional commitment. Shittu and Odeyemi (2025) further found that perceptions of politicisation, exclusion from decision-making, and lack of tangible benefits discourage active participation. This erosion of trust has practical consequences for professional engagement. Liu et al. (2023) reported that librarians increasingly distance themselves from association activities, leading to low attendance, minimal contribution, and weakened collective advocacy. Importantly, these behaviours are rooted in lived emotional experiences of frustration, disillusionment, and resignation, which quantitative indicators alone cannot fully capture. As engagement declines, professional associations lose their capacity to function as cohesive platforms, reinforcing fragmentation within the profession.

The cumulative effects of governance deficiencies, role ambiguity, identity crisis, and declining trust have far-reaching implications for professional practice and the future of librarianship in Nigeria. Empirical evidence indicated that weak professional structures limit librarians' capacity for innovation, advocacy, and ethical leadership (Yaya & Kikelomo, 2015; Michalak & Ellixson, 2025). Freidson (2001) argues that professions lacking strong collective organisation struggle to assert autonomy and adapt to external pressures. In the Nigerian context, this vulnerability is particularly concerning given the rapid digital transformation of information services and increasing global competition. Studies indicate that professions with trusted and effective associations are better positioned to navigate technological change while preserving professional values (Gul & Bano, 2019; Lee, 2021). However, Nigerian librarianship risks professional stagnation if institutional deficiencies remain unresolved. These implications underscore the urgency of understanding professional association failures not merely as organisational shortcomings but as lived realities that shape practice, cohesion, and professional futures.

Literature Gap

Although existing studies provide valuable empirical insights into professional governance and identity, most rely on surveys, document analysis, or institutional critique. Such approaches, while informative, often fail to capture the depth of meaning through which librarians experience professional association deficiencies. A phenomenological approach addresses this gap by privileging lived experience as a source of knowledge. Therefore, exploring how librarians perceive, interpret, and make sense of governance failures, contested authority, identity tensions, and disengagement, this study responds directly to the limitations of existing literature and provides a human-centred foundation for rethinking professional association reform in Nigerian librarianship.

Theoretical Foundation of the Study

Understanding the persistent deficiencies of professional associations requires more than institutional description; it demands theoretical frameworks that explain how professions acquire authority, how that authority is sustained, and what happens when it weakens. This study is anchored on two complementary theories, Professional Jurisdiction Theory and Professional Identity Theory, both of which were propounded to address fundamental societal concerns about professional power, legitimacy, and cohesion. Professional Jurisdiction Theory, propounded by Abbott (1988), emerged in response to longstanding sociological questions concerning how professions claim, defend, and legitimise control over specialised areas of work. Before Abbott's intervention, professional dominance was often treated as static and unquestioned. Abbott challenged this assumption by demonstrating that professional authority is socially constructed, continuously negotiated, and vulnerable to disruption. His theory was intended to explain why some professions maintain coherence and societal trust, while others experience fragmentation and declining legitimacy.

At the heart of the theory is the concept of jurisdiction, defined as the socially recognised link between a profession and its work. Abbott (1988) argued that professions depend on clearly demarcated jurisdictions supported by law,

institutional authority, and public recognition to sustain professional coherence. When jurisdictions are ambiguous or contested, professions face weakened authority, internal conflict, and diminished capacity to regulate practice. Importantly, the theory was propounded to address broader societal concerns about regulatory confusion, declining professional standards, and public mistrust arising from overlapping professional mandates. This theoretical perspective is particularly relevant in contemporary societies where professional boundaries are increasingly blurred by technological change and regulatory overlap. In the context of this study, Professional Jurisdiction Theory provides a critical lens for examining how overlapping roles between regulatory and professional bodies in Nigerian librarianship have weakened institutional authority, generated confusion among practitioners, and undermined professional coherence.

While Professional Jurisdiction Theory explains how professional authority is structured externally, it does not fully account for how professionals experience such authority internally. This gap is addressed by Professional Identity Theory, which was advanced by scholars such as Cruess et al. (2019) and Fitzgerald (2020) to explain how individuals come to understand themselves as professionals within social and institutional contexts. The theory was propounded in response to growing concerns about professional alienation, declining commitment, and identity erosion in modern professions. Professional Identity Theory posits that professional identity is not merely acquired through formal qualifications but is constructed through socialisation, institutional recognition, shared values, and sustained engagement with professional communities. Its primary purpose was to explain why professionals remain committed to their occupations, uphold ethical standards, and engage in collective action even in the face of external pressures. However, when institutions fail to reinforce professional identity, practitioners experience uncertainty, diminished confidence, and weakened professional loyalty.

In an attempt to apply this theory to librarianship, scholars have shown that professional associations play a central role in shaping identity by articulating professional values, advocating for recognition, and providing platforms for professional interaction (Cruess et al., 2019; Fitzgerald, 2020; Russell & Bodine, 2026). Within the Nigerian context, however, governance deficiencies and contested authority have limited the capacity of librarianship associations to fulfil these identity-forming functions. As a result, many librarians navigate conflicting expectations between traditional custodianship and digital innovation, professional autonomy and institutional subordination, and advocacy and regulation, leading to identity fragmentation and reduced professional pride. Concurrently, Professional Jurisdiction Theory and Professional Identity Theory offer a comprehensive framework for understanding professional association deficiencies in Nigerian librarianship. Jurisdiction theory explains how structural ambiguities and contested authority weaken institutional legitimacy, while professional identity theory illuminates how these structural failures are internalised by practitioners, shaping trust, engagement, and professional self-concept. By strategically integrating these theories, this study moves beyond organisational critique to examine how institutional deficiencies translate into lived professional realities. Consequently, these theories collectively enable this study to interrogate not only why Nigerian librarianship associations struggle to command legitimacy and trust, but also how such struggles shape the everyday experiences, identities, and future orientations of practising librarians. In doing so, the study situates professional association deficiencies within a broader societal and theoretical context, offering a nuanced foundation for understanding professional reform in Nigerian librarianship.

Methodology

Design

This study adopted a phenomenological approach of qualitative research design to explore librarians' lived experiences of professional association deficiencies and the associated identity tensions within Nigerian librarianship. The phenomenological approach was considered appropriate because it enables an in-depth examination of how individuals perceive, experience, and interpret institutional and professional realities in their everyday practice (Creswell & Poth, 2018; van Manen, 2016). Rather than measuring institutional performance or policy effectiveness, the study sought to uncover the meanings librarians attach to professional governance, regulatory structures, and professional identity formation. This approach allowed for a nuanced understanding of how deficiencies in professional associations are experienced subjectively and negotiated socially within the Nigerian context. The qualitative orientation of the study was particularly suited to capturing the complex organisational, socio-professional, and emotional dimensions of librarianship, especially issues relating to trust, legitimacy, professional cohesion, and identity. By foregrounding practitioners' voices, the study provided rich insights into the structural and personal dynamics shaping librarians' engagement with professional associations and their implications for professional practice and development.

Population and Sampling

The population of the study comprised librarians working in academic, public and special libraries and library schools across Nigeria's six geopolitical zones: North-Central, North-East, North-West, South-East, South-South, and South-West. The study employed purposive sampling, a non-probability sampling technique widely used in qualitative and phenomenological research to identify participants who possess extensive knowledge, experience, and direct engagement with the phenomenon under investigation (Creswell & Poth, 2018; Patton, 2015). The selection process involved identifying professional librarians who met predetermined inclusion criteria. For the purpose of this study, an experienced professional librarian was defined as an individual who possessed a recognized professional qualification

in Library and Information Science, had a minimum of ten years of professional experience in an academic library, actively participated in professional library associations through membership, committee service, leadership roles, or regular professional engagements, and demonstrated substantial knowledge of governance, regulatory, and professional development issues within the Nigerian librarianship profession. These criteria were established to ensure that participants possessed the experiential and contextual knowledge necessary to provide rich and meaningful insights into the phenomenon being investigated. Potential participants were identified through professional association records, institutional directories, and professional networks. Following the principles of purposive sampling, participants were deliberately selected based on their capacity to provide information-rich accounts rather than to achieve statistical representativeness (Patton, 2015). One participant was selected from each of the six geopolitical zones, resulting in a total sample size of twelve participants. This strategy ensured geographical diversity while enabling the researcher to capture variations in professional experiences across different sociocultural and institutional contexts within Nigeria. The selection approach further reflects the principles of maximum variation purposive sampling, which seeks to capture diverse perspectives from participants operating in different settings while identifying common patterns across experiences (Creswell & Poth, 2018). By drawing participants from all six geopolitical zones, the study enhanced the breadth of contextual perspectives without compromising the depth of inquiry required in phenomenological research. Although the sample size was relatively small, its adequacy was determined by the concept of information power rather than numerical considerations. Malterud et al. (2016) argued that qualitative studies require fewer participants when the research aim is focused, the participants possess specific expertise, and the quality of dialogue is strong. The selected participants were considered information-rich cases whose extensive professional experience and involvement in professional association activities enabled an in-depth exploration of the lived realities of librarianship and professional association governance in Nigeria.

Data Collection Procedure and Instrument

Data were collected through a Focus Group Discussion (FGD), chosen for its effectiveness in facilitating shared reflection, dialogue, and collective meaning-making among participants. FGD are particularly valuable in phenomenological studies where professional experiences are shaped by shared institutional and social contexts. A structured discussion guide was developed to direct the conversation while allowing flexibility for probing and elaboration.

The discussion focused on the following thematic areas:

- ✓ Participants' experiences with professional associations and perceptions of institutional, governance, and regulatory deficiencies;
- ✓ Perceived impacts of these deficiencies on professional identity, trust, and day-to-day professional practice;
- ✓ Experiences of professional cohesion, marginalisation, or conflict within the profession; and
- ✓ Participants' views on professional reform, governance improvement, and the future of librarianship in Nigeria.

The FGD was conducted in July 12, 2025 and lasted approximately two hours and five minutes. Due to participants' geographical dispersion and professional commitments, the session was held online using Zoom, which facilitated participation across locations and ensured sustained engagement.

Ethical Considerations

Before data collection, participants were provided with detailed information about the purpose of the study, and informed consent was obtained electronically. Ethical principles of confidentiality, anonymity, and voluntary participation were strictly observed. Pseudonyms were used to protect participants' identities, and participants were informed of their right to withdraw from the study at any stage without penalty. Permission was granted to audio-record the session, and all data were securely stored and used solely for academic purposes.

Data Analysis and Trustworthiness

The audio recording was transcribed verbatim using Otter.ai (version 3.4) and manually cross-checked against the original recording to ensure accuracy. The transcript was read repeatedly to achieve immersion and familiarity with the data. Analysis followed a phenomenological thematic approach, involving line-by-line coding to identify significant statements, which were then clustered into meaning units and emergent themes reflecting participants' shared and divergent experiences. To enhance the trustworthiness of the findings, member checking was employed, with participants reviewing both the transcript and a summary of the emergent themes to confirm accuracy and resonance with their experiences. Reflexive notes were maintained throughout the research process to document analytical decisions and minimise researcher bias. Thick descriptions of the study context and participants were provided to support transferability, while a transparent audit trail ensured dependability and credibility of the findings.

Data Analysis and Presentation

1. Governance and Regulatory Deficiencies in Nigerian Librarianship

This section presents the lived experiences of twelve participants regarding governance and regulatory deficiencies within professional associations in the Nigerian librarianship landscape. Reflections from the FGD revealed that

governance challenges are deeply embedded in everyday professional life, shaping librarians' perceptions of legitimacy, trust, leadership credibility, and professional belonging. Participants repeatedly referenced key professional bodies such as the Nigerian Library Association (NLA), the Librarians' Registration Council of Nigeria (LRCN), and the National Association of Library and Information Science Educators (NALISE) as central to these experiences. The findings are organised into interconnected themes and narrated reflectively to capture the collective sense-making that emerged during the discussion.

Weak Governance Structures and Leadership Disconnect

Across the discussion, participants repeatedly returned to the issue of weak governance and ineffective leadership within professional bodies, especially the NLA. One participant opened the conversation by reflecting that leadership within the association often feels distant and ceremonial rather than functional. This sentiment resonated immediately with others, who described how major decisions such as conference locations, fee increases, or policy positions are frequently announced without prior consultation with members. Another participant added that even though the NLA constitution emphasises participatory governance, in practice, leadership appears insulated from the realities of practising librarians. As the conversation deepened, participants collectively reflected on leadership selection processes. Several noted that leadership positions within the NLA tend to circulate among a familiar group of senior academics and long-standing elites. One participant observed that elections often feel predictable, which discourages ordinary members from contesting or even voting. Others agreed, noting that this perceived recycling of leadership weakens accountability and reinforces the feeling that the association serves a select few rather than the profession as a whole. In these reflections, governance failure was not experienced abstractly but as a daily reminder that professional voices are largely unheard.

Overlapping Mandates and Regulatory Role Confusion (NLA–LRCN Tensions)

A particularly segment of the FGD centred on the persistent confusion surrounding the roles of the NLA and the LRCN. Participants described this overlap as one of the most destabilising features of Nigerian librarianship. One participant reflected that, as practising librarians, he's often unsure whether professional authority lies with the NLA as a professional association or with the LRCN as a regulatory body. Others quickly affirmed this confusion, noting that directives from both bodies sometimes overlap, contradict, or remain poorly communicated. The discussion revealed a shared perception that the relationship between the NLA and LRCN is characterised more by rivalry than collaboration. Participants expressed frustration that instead of presenting a unified front for professional advocacy, both bodies appear to compete for relevance and authority. One participant remarked that this tension leaves librarians caught in the middle, expected to comply with LRCN regulations while simultaneously paying dues and pledging loyalty to the NLA. Collectively, participants reflected that this ambiguity weakens professional coherence and undermines the legitimacy of both institutions in the eyes of practitioners.

Weak Enforcement of Professional Standards and Ethical Regulation

When the discussion shifted to professional standards and ethics, participants unanimously agreed that enforcement mechanisms remain largely ineffective. Several participants noted that while the LRCN has established codes of practice and ethical guidelines, enforcement is inconsistent and often selective. One participant reflected that ethical violations ranging from unprofessional conduct to credential misrepresentation are widely known within the profession, yet rarely attract meaningful sanctions. Others added that disciplinary structures exist mostly on paper. A participant remarked that when ethical breaches involve influential individuals or senior members of the NLA, cases tend to fade quietly without resolution. This observation prompted broader reflection among the group, with participants agreeing that selective enforcement sends damaging signals to early-career librarians. They collectively interpreted this as a breakdown of moral authority, where professional rules exist but lack credibility because they are not applied fairly or transparently.

Marginalisation and Exclusion from Decision-Making

Another deeply emotive theme that emerged was the marginalisation of practising librarians, particularly those outside academic institutions, from decision-making processes. Participants described the NLA as heavily dominated by academic librarians, often to the exclusion of professionals working in public, school, and special libraries. One participant reflected that policy discussions rarely consider the realities of under-resourced libraries or non-university settings. Others built on this reflection, noting that younger librarians and those at the grassroots level rarely have channels to influence professional discourse. A participant observed that even when feedback mechanisms exist, they are rarely acted upon. As the conversation unfolded, participants described this exclusion not merely as structural neglect but as an erosion of professional dignity. Feeling invisible within one's own profession was repeatedly described as emotionally draining and professionally demotivating.

Sentiment, Bias, Leadership Credibility, and Compromised Democratic Processes

A particularly emotive segment of the discussion centred on sentiment, personal bias, and leadership credibility, with specific reference to leadership elections within NALISE. Participants described this episode as emblematic of deeper character and integrity challenges within professional associations. One participant recounted how a highly credible and visionary candidate, widely recognised for competence and commitment, lost leadership support due not to a lack of capacity but because of personal sentiments, regional loyalties, and interpersonal disagreements. Another participant

reflected that many members openly admitted refusing to vote, not because they doubted the candidate's ability to move the association forward, but because of unresolved personal grievances and subjective perceptions. As the discussion unfolded, participants agreed that leadership decisions within NALISE were compromised by emotional bias rather than professional merit. One participant lamented that "we sacrificed competence on the altar of sentiment," a statement that resonated strongly across the group. The discussion further revealed that such behaviour is not unique to NALISE but reflects a broader leadership culture within Nigerian librarianship, where personal characteristics, popularity, and informal alliances often outweigh integrity, vision, and accountability. Participants agreed that this pattern damages institutional credibility and discourages capable professionals from offering themselves for leadership roles, thereby perpetuating mediocrity and stagnation.

Erosion of Trust and Declining Professional Engagement

The cumulative effect of governance failures, role ambiguity, and exclusion was most evident in participants' reflections on trust and engagement. All twelve participants acknowledged a gradual withdrawal from active participation in professional association activities. One participant candidly noted that attendance at NLA meetings or conferences is often driven by obligation rather than enthusiasm. Others echoed this sentiment, describing how membership dues are paid mainly for compliance or credentialing purposes, particularly in relation to LRCN requirements. As the discussion progressed, participants collectively reflected on how trust has been eroded over time. Broken promises, weak advocacy, and perceived self-interest among leaders were repeatedly cited. One participant remarked that professional associations no longer feel like safe spaces for collective growth but rather bureaucratic structures disconnected from members' needs. These reflections revealed how governance deficiencies translate into emotional responses, frustration, resignation, and apathy that ultimately weaken professional cohesion.

Regional Nuances in Governance Experiences

While participants agreed that governance deficiencies are widespread, the discussion also highlighted regional nuances in how these challenges are experienced. Participants from the North-East reflected on feelings of abandonment, noting that professional bodies rarely advocate effectively for librarians in regions with limited institutional support. In contrast, participants from the South-West and South-South spoke more about elitism and power concentration, observing that professional opportunities and leadership visibility tend to cluster around certain institutions and regions. These reflections did not contradict one another; rather, they reinforced a shared perception of inequity within professional governance. Participants collectively interpreted these regional differences as evidence of systemic imbalance rather than isolated problems, further deepening their sense of institutional disconnect.

The findings demonstrate that governance and regulatory deficiencies in Nigerian librarianship across the NLA, LRCN, and emerging bodies like NALISE are deeply lived and emotionally experienced realities. Weak leadership, regulatory ambiguity, poor ethical enforcement, exclusion from decision-making, sentiment-driven leadership choices, and compromised democratic processes have collectively eroded trust, fragmented professional identity, and weakened engagement. These insights underscore the urgent need for transparent, merit-based, and emotionally intelligent governance reforms that can restore credibility, rebuild trust, and reposition Nigerian librarianship for a sustainable professional future.

Discussion: The findings reveal that governance and regulatory deficiencies in Nigerian librarianship profoundly affect professional identity, trust, and engagement. Participants described leadership within the NLA, LRCN, and NALISE as distant, elitist, and unresponsive, with decision-making often occurring without member consultation. Leadership appointments were perceived as predictable and influenced by personal bias and regional loyalties, reinforcing the sense that associations serve a select few. Overlapping roles between the NLA and LRCN added confusion regarding authority and compliance, while inconsistent enforcement of codes of practice undermined ethical credibility, particularly for early-career librarians. Marginalisation of professionals outside academic institutions and in under-resourced regions further eroded engagement and confidence. These experiences align with prior literature documenting weak governance and fragmented professional identity in Nigerian librarianship (Saleh & Sagem, 2019; Igiamoh & Emwanta, 2016; Eklund, 2022; Shittu & Odeyemi, 2025). Abbott's (1988) Professional Jurisdiction Theory explains how contested authority and blurred institutional boundaries weaken legitimacy, while Professional Identity Theory (Cruess et al., 2019; Fitzgerald, 2020; Russell & Bodine, 2026) highlights how such structural weaknesses are internalised, reducing confidence, belonging, and professional pride. Collectively, the findings highlight the need for transparent, merit-based, and inclusive governance reforms to rebuild trust and strengthen the profession.

2. Perceptions of Overlapping Roles, Role Ambiguity, and Contested Authority in Nigerian Librarianship

This section examines how twelve participants collectively perceive and experience overlapping roles, role ambiguity, and contested authority among professional and regulatory bodies within Nigerian librarianship. Reflections from the Focus Group Discussion (FGD) reveal that librarians do not encounter these issues as abstract institutional arrangements; rather, they experience them as daily professional confusion, emotional strain, and weakened allegiance to professional structures. Conversations repeatedly returned to the blurred boundaries between the Librarians' Registration Council of Nigeria (LRCN) as a statutory regulatory body and the Nigerian Library Association (NLA) as

a professional association, as well as the implications of these blurred roles for authority, compliance, and professional identity. Participants' narratives were categorised into interrelated themes, presented below as reflective, flowing accounts of shared lived experience.

Blurred Institutional Boundaries and Role Confusion

Across the discussion, participants consistently expressed uncertainty about where the responsibilities of professional associations end and where regulatory authority begins. Rather than perceiving LRCN and NLA as complementary bodies, participants described an environment of blurred boundaries that generates confusion and frustration. One participant from the North-Central zone reflected that, in practice, "we are told LRCN is the regulator, and NLA is the professional body, but when it comes to directives, trainings, sanctions, and even professional identity, the lines are not clear." This sentiment was echoed by a participant from the South-East, who added that librarians often receive overlapping instructions from both bodies, sometimes with conflicting expectations: "You attend an NLA programme and hear one thing, then LRCN issues a circular that suggests something else. As practising librarians, we are left to interpret which one carries more weight." As the discussion unfolded, participants collectively agreed that this lack of clarity has become normalised within the profession. A participant from the South-West noted that younger librarians frequently ask senior colleagues basic questions about compliance, registration, and professional obligations, only to receive uncertain answers: "Even those of us who have been in the system for years sometimes don't know who has the final authority." This persistent ambiguity was described as eroding professional confidence and weakening librarians' sense of institutional order.

Contested Authority and Institutional Rivalry

Beyond confusion, participants perceived the relationship between professional and regulatory bodies as marked by subtle rivalry rather than collaboration. Several participants described situations where authority appeared contested, particularly between LRCN and NLA. A participant from the North-West observed that "instead of presenting a united front for the profession, it sometimes feels like power struggles are being played out behind the scenes." This perception was reinforced by another participant from the South-South, who noted that public disagreements, parallel programmes, and overlapping mandates often signal institutional competition rather than synergy. The discussion revealed that librarians experience this contested authority as professionally destabilising. One participant reflected that when bodies that are meant to protect and guide the profession appear divided, "it becomes difficult for us to take any of them seriously." Participants noted that, unlike professions such as law or medicine—where regulatory councils and professional associations have clearly defined and respected roles—librarianship in Nigeria appears fragmented. This fragmentation, participants agreed, weakens librarians' collective voice and diminishes the profession's public legitimacy.

Compliance Uncertainty and Professional Insecurity

Another recurring theme was uncertainty surrounding compliance and accountability. Participants described being unsure about whose directives are compulsory and whose are merely advisory. A participant from the North-East shared that many librarians comply with professional requirements not out of conviction but out of fear of sanctions: "Sometimes you're not sure if a directive is enforceable, but you comply anyway just to be safe." Others added that this uncertainty creates anxiety, particularly for early-career librarians who fear professional repercussions without fully understanding the rules. As the conversation deepened, participants linked compliance confusion directly to professional insecurity. A participant from the South-West remarked that "when rules are unclear, and authority is contested, professionalism becomes arbitrary." The group agreed that inconsistent enforcement, particularly when influential individuals appear exempt from sanctions, further complicates librarians' understanding of accountability. In this context, professional regulation was experienced as uneven and unpredictable rather than fair and developmental.

Leadership Conflicts, Sentiment, and Credibility Challenges

Participants also reflected on how leadership struggles and personal sentiments exacerbate role ambiguity and contested authority. Several participants recounted experiences within professional associations, including NLA and specialised bodies such as NALISE, where leadership credibility was questioned. A participant from the South-South explained that "there have been times when capable leaders were sidelined because of personal preferences, regional sentiment, or perceived alliances." Another participant added that in some leadership elections, members deliberately abstained from voting because they lacked confidence in the candidates presented: "People felt that the process was already compromised, so participation seemed meaningless." These reflections revealed that leadership flaws, such as perceived bias, lack of transparency, and personality-driven politics, intensify institutional confusion. Participants agreed that when leaders lack moral authority or professional credibility, institutional authority itself becomes contested. This dynamic, they noted, contributes to apathy and disengagement, as members no longer see leadership structures as legitimate drivers of professional progress.

Cultural and Religious Bias in Professional Authority

An emergent but powerful theme was the influence of cultural and religious bias on perceptions of authority and leadership within professional bodies. Participants acknowledged that, although rarely discussed openly, cultural affiliations and religious identity sometimes shape leadership selection and acceptance. A participant from the North-

Central zone reflected cautiously: "There are times when leadership decisions are interpreted through cultural or religious lenses, even when competence should be the main criterion." Another participant from the South-West added that these perceptions, whether real or assumed, deepen mistrust and reinforce divisions within the profession. The group agreed that such biases complicate already fragile governance structures. When professional authority is perceived as culturally or religiously skewed, it becomes harder for associations to command collective loyalty. Participants emphasised that these dynamics further weaken efforts to build a unified professional identity and exacerbate contested authority between institutional bodies.

Impact on Professional Identity and Collective Cohesion

As the discussion drew together, participants collectively reflected on the broader implications of overlapping roles and contested authority. They agreed that persistent ambiguity undermines professional identity formation. A participant summarised this sentiment succinctly: "When we don't know who truly speaks for the profession, it becomes difficult to know what it means to be a librarian." Participants noted that this identity uncertainty affects how librarians present themselves within their institutions and how they engage with professional development and advocacy. Ultimately, the FGD revealed that overlapping roles, role ambiguity, and contested authority are experienced as deeply personal and professional challenges. These issues shape librarians' trust, confidence, and willingness to engage with professional bodies such as LRCN and NLA. Rather than fostering cohesion, current institutional arrangements were perceived as reinforcing fragmentation, uncertainty, and disengagement. The findings demonstrate that librarians perceive overlapping mandates and contested authority among professional and regulatory bodies as a central weakness within Nigerian librarianship. Blurred institutional boundaries, leadership credibility challenges, cultural and religious biases, and inconsistent enforcement of authority collectively shape librarians' lived experiences of confusion, frustration, and professional insecurity. These reflections underscore the urgent need for clearer role demarcation, credible leadership, and collaborative governance between LRCN, NLA, and related professional bodies to restore trust, strengthen professional identity, and ensure the future cohesion of librarianship in Nigeria.

Discussion: The study findings indicate that Nigerian librarians experience overlapping roles, role ambiguity, and contested authority as persistent professional challenges that affect identity, trust, and engagement. Participants described blurred boundaries between the NLA as a professional association and the LRCN as a regulatory body, noting conflicting directives, unclear compliance expectations, and uncertainty about which body holds ultimate authority. These experiences mirror prior observations that ambiguous institutional mandates undermine professional coherence and legitimacy (Ogunmodede & Nwalo, 2015; Omotoso & Igiamoh, 2016). Participants further reported that leadership conflicts, personal sentiment, and perceived bias exacerbate these ambiguities, reducing confidence in institutional processes and discouraging active participation, consistent with Anaeche's (2025) findings on dissatisfaction with governance and leadership transparency. Cultural and religious considerations were also perceived to influence leadership selection and institutional acceptance, compounding mistrust and reinforcing divisions. These structural and social dynamics directly affect professional identity. Participants noted that uncertainty regarding authority and inconsistent enforcement of standards leads to professional insecurity and disengagement. Merga (2019) and Vassilakaki and Moniarou-Papaconstantinou (2015) similarly observe that unclear roles and institutional fragmentation erode professional identity and belonging. Abbott's (1988) Professional Jurisdiction Theory explains how contested authority and blurred boundaries weaken institutional legitimacy, while Professional Identity Theory (Cruess et al., 2019; Fitzgerald, 2020; Russell & Bodine, 2026) illustrates how such governance failures are internalised, reducing confidence, loyalty, and willingness to engage. Overall, the findings suggest that overlapping mandates and contested authority are central weaknesses in Nigerian librarianship, highlighting the urgent need for clear role demarcation, credible leadership, and collaborative governance to restore trust and strengthen professional identity.

3. Implications of Professional Association Deficiencies for the Future Development of Librarianship in Nigeria

This section interprets how deficiencies within professional associations shape librarians' perceptions of the future development of librarianship in Nigeria, as articulated by twelve participants during the FGD. Participants' reflections revealed that governance failures, leadership weaknesses, regulatory ambiguity, and declining trust are not only immediate challenges but also long-term threats to professional growth, relevance, and sustainability. At the same time, participants drew comparisons with international professional bodies such as the International Federation of Library Associations and Institutions (IFLA), the Association for Information Science and Technology (ASIS&T), and the Chartered Institute of Library and Information Professionals (CILIP), using these examples to imagine alternative professional futures for Nigerian librarianship.

Stagnation of Professional Growth and Innovation

Participants repeatedly expressed concern that unresolved governance deficiencies are contributing to professional stagnation. One participant reflected that Nigerian librarianship appears to be "moving in circles," with recurring debates about leadership, regulation, and legitimacy crowding out conversations about innovation, research, and emerging practice areas. Others agreed, noting that professional associations such as the NLA often spend more time managing internal disputes than articulating a clear strategic vision for the profession. In contrast, participants pointed to IFLA as an example of how strong governance enables forward-looking professional agendas. One participant observed that IFLA consistently foregrounds global issues such as digital inclusion, open access, artificial intelligence, and climate

action, thereby positioning librarianship as socially relevant and future-oriented. By comparison, participants felt that Nigerian professional bodies struggle to articulate coherent national priorities, leaving librarians ill-prepared to respond to technological and societal change. A counter-view was, however, offered by one participant who argued that the problem is not a lack of ideas but weak implementation capacity. According to this participant, "We have brilliant position papers and conference themes, but they rarely translate into sustained programmes." This reflection suggests that the future challenge lies less in intellectual deficit and more in institutional effectiveness.

Weak Professional Advocacy and Public Visibility

Another major implication discussed was the declining public visibility and policy influence of librarianship in Nigeria. Participants noted that professional associations have not been sufficiently effective in advocating for libraries within national development frameworks, education reform, or digital policy spaces. One participant remarked that librarians are often absent from policy conversations where information, knowledge management, and digital literacy should be central. Several participants contrasted this experience with CILIP in the United Kingdom, which they described as highly visible in national debates on information ethics, misinformation, and professional standards. According to one participant, "CILIP has managed to brand librarians as information professionals with authority. Here, we are still struggling to convince policymakers that libraries matter." At the same time, a dissenting voice cautioned against idealising international bodies. This participant noted that organisations like CILIP and ASIS&T operate within more stable political and economic systems, which makes advocacy easier. Nevertheless, the group agreed that Nigerian associations could still adopt elements of international best practice, such as strategic partnerships, consistent public communication, and evidence-based advocacy.

Fragmentation of Professional Identity and Future Workforce Confidence

Participants also reflected on how association deficiencies shape the future professional identity of librarians, particularly for early-career practitioners. Several participants expressed concern that young librarians increasingly view professional associations as irrelevant or burdensome, rather than as sources of inspiration and support. One participant observed that "new entrants are already cynical; they join associations because it is required, not because they believe in them." This sentiment was contrasted with experiences of international engagement. A participant who had attended ASIS&T conferences remarked that early-career professionals are actively mentored, visible, and encouraged to contribute intellectually. According to this participant, such inclusive professional cultures help sustain confidence and commitment to the field. In Nigeria, however, participants feared that persistent exclusion, politicisation, and sentiment-driven leadership decisions may discourage talented professionals from investing in the profession long-term. A counter-submission emerged when one participant suggested that adversity could also breed resilience. They argued that some Nigerian librarians are developing alternative professional identities through international networks, research collaborations, and online communities, thereby bypassing local institutional failures. While this view acknowledged individual agency, others cautioned that a profession cannot rely solely on personal resilience without strong collective institutions.

Risk of Continued Institutional Irrelevance

Participants collectively warned that if governance and trust issues remain unresolved, professional associations risk becoming administratively relevant but professionally hollow. One participant described a future in which associations exist mainly to collect dues, issue certificates, and organise routine conferences, without exerting meaningful influence on practice or policy. This concern was particularly strong in discussions about the relationship between the NLA and the LRCN, where unresolved role ambiguity was seen as undermining long-term institutional credibility. By contrast, participants noted that international bodies such as IFLA have managed to clearly separate regulatory, advocacy, and professional development functions through transparent governance structures and global accountability mechanisms. Participants agreed that Nigerian librarianship must move towards similar clarity if it is to remain relevant in an increasingly competitive information environment.

Reimagining the Future: Reform, Learning, and Possibility

Despite these concerns, the discussion did not end in pessimism. Participants emphasised that the future of Nigerian librarianship is not irreversibly bleak. Several participants expressed cautious optimism that governance reforms, leadership renewal, and learning from international models could reposition the profession. One participant reflected that "IFLA, ASIS&T, and CILIP did not become effective overnight; they evolved through deliberate reforms and difficult conversations." Another participant added that rebuilding trust, rather than merely restructuring institutions, should be central to future reforms. This involved transparent leadership, merit-based elections, consistent ethical enforcement, and genuine inclusion of diverse practitioner voices. Participants agreed that without addressing the emotional dimensions of trust, belonging, and professional pride, structural reforms alone would be insufficient. The findings indicate that participants interpreted professional association deficiencies as critical determinants of the future trajectory of librarianship in Nigeria. Weak governance, fragmented authority, and declining trust threaten innovation, advocacy, identity formation, and institutional relevance. However, comparative reflections on international associations such as IFLA, ASIS&T, and CILIP offered participants a vocabulary of possibilities, demonstrating that strong governance, inclusive leadership, and strategic vision can reposition librarianship as a dynamic and socially

relevant profession. The findings suggest that the future development of Nigerian librarianship will depend not only on policy reform but on rebuilding credible, trusted, and emotionally intelligent professional institutions capable of inspiring collective confidence and professional renewal.

Discussion: The study findings indicate that deficiencies within professional associations shape librarians' perceptions of the future development of Nigerian librarianship, with governance failures, regulatory ambiguity, and declining trust viewed as threats to professional growth, innovation, and relevance. Participants reported that weak leadership and unresolved internal disputes divert attention from strategic vision and innovation, leaving the profession ill-prepared to respond to technological and societal change. This aligns with Saleh and Sagem (2019) and Igiamoh and Emwanta (2016), who note that weak institutional structures limit professional advancement, while Freidson (2001) suggests that professions lacking strong collective organisation struggle to assert autonomy and adapt. Comparisons with international bodies such as IFLA, ASIS&T, and CILIP highlighted how transparent governance and strategic advocacy strengthen professional visibility, identity, and public influence, underscoring gaps in Nigerian professional associations. Participants also observed that ongoing exclusion, politicisation, and sentiment-driven leadership threaten the professional identity and confidence of early-career librarians, reinforcing patterns of disengagement documented by Merga (2019) and Vassilakaki and Moniarou-Papaconstantinou (2015). Nevertheless, some participants suggested that engagement in international networks and research collaborations demonstrates potential for resilience, though collective institutional reform remains essential. Abbott's (1988) Professional Jurisdiction Theory explains how blurred mandates and contested authority weaken institutional credibility, while Professional Identity Theory (Cruess et al., 2019; Fitzgerald, 2020; Russell & Bodine, 2026) illustrates how governance failures are internalised, influencing confidence, loyalty, and professional commitment.

Conclusion

In conclusion, the study demonstrates that deficiencies within professional associations significantly undermine the practice and development of librarianship in Nigeria. Weak governance, leadership disconnect, overlapping mandates, and inconsistent enforcement of ethical standards create professional confusion, erode trust, and fragment professional identity. Librarians experience marginalisation, particularly early-career professionals and those outside academic institutions, while contested authority between the Nigerian Library Association and the Librarians' Registration Council of Nigeria exacerbates compliance uncertainty and diminishes institutional legitimacy. These structural and leadership weaknesses not only hinder active engagement and professional cohesion but also threaten the long-term relevance, innovation, and advocacy capacity of the profession. Addressing these challenges through transparent, merit-based, and inclusive institutional reforms is critical for restoring trust, strengthening professional identity, and securing the sustainable future of Nigerian librarianship.

Recommendations

Based on the study findings, the following recommendations are proposed:

1. Professional associations should implement transparent, merit-based leadership selection processes, ensure equitable participation across all regions and career levels, and foster ethical, accountable decision-making to rebuild trust and credibility.
2. There should be a clear demarcation of responsibilities between regulatory and professional bodies, coupled with consistent enforcement of professional codes and ethical standards, which will reduce role ambiguity, contested authority, and professional insecurity.
3. Associations should engage all members, particularly early-career and non-academic, in professional programs, advocacy initiatives, and strategic decision-making, ensuring the profession remains innovative, relevant, and socially impactful.

Suggestion for Further Studies

1. Future research could explore the effectiveness of specific governance reform strategies in Nigerian librarianship, including comparative analyses of regional and international professional associations.
2. Additionally, studies could investigate the experiences of early-career librarians and practitioners in under-resourced regions to understand how targeted interventions in leadership, inclusion, and ethical enforcement impact professional identity, trust, and engagement over time.

Abstract

Democracy depends on an informed citizenry that understands their rights, responsibilities, and governance processes. Academic libraries play a key role in supporting democratic awareness by providing access to credible and accurate information and promoting information literacy for enhanced civic education among university students. The study examines academic libraries and democratic awareness among university students in Nigeria, with a focus on University of Nigeria, Nsukka. It was guided by four (4) specific objectives, and a null hypothesis. It adopted a mixed-method approach within a descriptive survey research design. The population of the study consisted of 300 undergraduate students, selected using simple random sampling technique. Data were collected with structured questionnaire. The data were analysed using descriptive statistics of frequency counts, mean scores, standard deviation and inferential statistics of Pearson Product Moment Correlation (PPMC) coefficient for answering the research questions and testing the null hypothesis. The finding of the study revealed that academic libraries play a significant role in promoting democratic awareness through the provision of access to credible and reliable information resources and services such as user education programmes, information literacy training, and civic-oriented services. It indicated a high level of awareness among the students regarding democratic values such as freedom of expression, rule of law, and civic responsibilities, which are largely influenced by academic library services. It identified inadequate funding, limited access to up-to-date digital resources, poor user engagement, and insufficient awareness programmes as the constraints to academic library contributions toward democratic awareness among students. The study concluded that there is a significant positive relationship between academic library services and students' democratic awareness in the University of Nigeria, Nsukka. It recommended, among other measures that government should provide adequate funding to academic libraries for enhanced democratic awareness activities, while University of Nigeria, Nsukka should strengthen library awareness programmes for improved students' democratic awareness in Nigeria.

Keywords: Academic Libraries, Democracy, Democratic Awareness, University Students, University of Nigeria, Nsukka.

Introduction

Democracy is widely regarded as one of the most acceptable systems of government in the modern world, as it promotes participation, accountability, transparency, and the protection of fundamental human rights. However, the success and sustainability of any democratic system depend on the level of awareness, knowledge, and active involvement of its citizens. Democratic awareness entails citizens' understanding of their rights and responsibilities, governance processes, electoral systems, and public policies. Without adequate awareness, citizens may be unable to make informed decisions or effectively participate in democratic processes.

In Nigeria, democratic governance has evolved over time, particularly since the return to civilian rule in 1999. Despite this progress, the country continues to face several challenges such as political apathy, misinformation, electoral irregularities, and low levels of civic participation. These issues highlight the need for effective mechanisms to educate and inform citizens about democratic values and practices. One of the key institutions that can facilitate this process are the academic libraries.

Academic libraries are integral parts of higher educational institutions, established to support teaching, learning, and research (Amadi et al., 2020; Akwang et al., 2024). Beyond these traditional roles, they serve as centres for information dissemination and knowledge development, while providing opportunities for information literacy training. By providing access to a wide range of information resources, including books, journals, government documents, and digital media, academic libraries contribute to the intellectual development of students and promote their critical thinking ability. These functions are essential in building an informed citizenry capable of engaging meaningfully in democratic governance.

Moreover, academic libraries play a significant role in promoting information literacy, which involves the ability to identify information needs, locate, evaluate, and use information effectively and ethically (Udoh & Okafor, 2022). In an era characterized by information explosion and the spread of misinformation, information literacy becomes crucial

for democratic awareness. This implies that university students who are information literate are better equipped to assess the credibility of information, make informed choices, and participate actively in civic life.

More so, the integration of information and communication technologies (ICT) in academic libraries has further enhanced the capacity of promoting democratic awareness among students. Through digital libraries, online databases, and institutional repositories, students can access current and relevant information on governance, elections, human rights, and public affairs from both local and global perspectives. This expanded access strengthens the role of academic libraries as agents of democratic education.

Statement of the Problem

Democracy thrives on an informed citizenry that possesses adequate knowledge of their civic rights, responsibilities, governance processes, and access to reliable information. In Nigeria, there is growing concern about the level of democratic awareness among citizens, especially among students in higher institutions. In fact, it is observed that despite the expansion of educational opportunities, many citizens, including students still exhibit limited understanding of democratic principles, political participation, and civic engagement. To achieve this, academic libraries, including University of Nigeria Nsukka (UNN), are expected to play a critical role in addressing this gap by providing access to credible and relevant information resources and services, supporting research, and promoting information literacy. Meanwhile, it appears that the potential of academic libraries in promoting democratic awareness among users is not fully realized, and this could be partly attributed to issues of inadequate funding, outdated or insufficient information resources, poor awareness of available library services, low information literacy levels of users, and limited integration of civic education programmes into the services of the academic libraries. In addition, preliminary observation shows that there is there is limited empirical evidence on how academic libraries at the University of Nigeria, Nsukka, contribute to democratic awareness among students. Thus, this study investigates academic libraries and democratic awareness among university students with a focus on University of Nigeria Nsukka.

Research Objective

This study examines academic libraries and democratic awareness among university students in Nigeria, with evidence from University of Nigeria, Nsukka. The specific objectives are;

1. To examine how academic libraries promote democratic awareness among students in the University of Nigeria, Nsukka.
2. To identify library resources that support democratic awareness in University of Nigeria, Nsukka library.
3. To assess the influence of academic library services on students' democratic awareness in University of Nigeria, Nsukka.
4. To ascertain challenges affecting library contributions to democratic awareness in University of Nigeria, Nsukka.

Hypothesis

A single null hypothesis was formulated and tested at 0.05 level of significance.

H_0: There is no significant relationship between academic library services and students' democratic awareness in the University of Nigeria, Nsukka.

Literature Review

Concept of Academic Libraries

Academic libraries are essential units in tertiary institutions that support teaching, learning, and research through the provision of information resources and services. According to Aina (2022), academic libraries serve as intellectual centres that provide access to both print and electronic resources necessary for academic development and knowledge creation. They serve as the hubs for intellectual development that are strategically established to foster democratic awareness through the provision of access to books, journals, digital resources, and civic education materials.

In recent studies, academic libraries are increasingly viewed as digital knowledge hubs that support not only academic work but also societal development, including civic engagement, democratic participation and citizenship education (Akwang et al., 2024; Ocholla & Bothma, 2022). Taiwo and Sulyman (2022) further noted that academic libraries fill two integral needs, namely: helping the school's curricula, and supporting the research of the university, faculty and students. Academic libraries are essentially well-known knowledge centres set up to support of the mission of their parent institutions by enhancing the creation of knowledge, equipping users, including students with the knowledge to serve the general public and advancing the prosperity of humanity (Oyegunle, as cited in Taiwo & Sulyman, 2022). Dei and Asante (2022) emphasized that academic libraries contribute to Sustainable Development Goals (SDGs) by ensuring equitable access to information and promoting lifelong learning. Sawyerr and Ibe (2023) argued that academic libraries act as agents of democratic engagement by providing access to government publications, civic education resources, and platforms for intellectual discussions. In institutions such as University of Nigeria Nsukka, academic libraries play a critical role in supporting students' access to governance-related information and civic education materials, which enable them to engage in democratic processes.

Concept of Democratic Awareness

Democratic awareness refers to the understanding of democratic principles such as rule of law, political participation, human rights, accountability, and civic responsibilities. Igbinovia and Popoola (2023) defined democratic awareness as the ability of individuals to understand governance systems and actively participate in democratic processes. Democratic awareness is particularly important due to issues of political apathy, misinformation, and low civic engagement among youths (Umar & Tukur, 2024). Academic libraries can support democratic awareness by empowering their patrons through a variety of programmes, activities and services, as well as offering space for public use. They can also play catalytic role in cultivating healthy democratic communities and political participation. Democratic awareness is equally promoted by the academic libraries through training of citizens and students to develop their abilities for informed and democratic consciousness.

Information Literacy and Democracy

Information literacy is a fundamental skill and ability of finding, evaluating, and ethically utilizing information in making informed decisions (Osiebe, et al., 2023; Udoh & Okafor, 2022). Association of College and Research Library (ACRL) Framework (2023) suggested that information literacy enables individuals, including students to locate, evaluate, and use information effectively in decision-making processes. Information literacy is the bedrock of a functional democracy, promoting informed and democratically conscious citizens who are able to think critically and act responsibly when it comes to comparing diverse views, making evidence-based decisions, and actively participating in civic engagements. Buschman (2023) underscores the importance of information literacy in democracy by pointing out that information literacy is a building block of informed citizenship. This follows the position of Wolin, as cited by Buschman (2023), which underpinned the well-established connection between information literacy and democracy, serving as a political and civic reasons in democratic societies. Information literacy is an essential ingredient of democracy, fostering citizenship, participation, empowerment and civic engagement, while countering misinformation and fake news in the society (American Library Association, 2020). Issa et al. (2022) found that information literacy training in academic libraries empowers students to critically evaluate political information and resist misinformation. It helps students as members of the society to promote societal resilience against misinformation and deliberate disinformation campaigns (Lupien & Rourke, 2021). Information literacy particularly empowers students to recognize biases, question sources, verify facts, as well as exercise their democratic rights such as voting in elections and positively engaging of governance discourse.

Review of Empirical Studies

Recent literature highlights that academic libraries contribute significantly to democratic awareness by providing access to credible and reliable information and promoting information literacy skills. Vedra et al. (2025) investigated political awareness and engagement in relation to voting behaviour among college students. The study showed high political awareness, moderate engagement, and high positive voting behaviour, with significant positive correlations between both awareness and engagement with voting behaviour. It indicated that political awareness and engagement together significantly predict voting behaviour of the students. It concluded that strengthening political awareness and providing genuine engagement opportunities are essential for fostering informed and responsible voting among the college students. The study recommended that educational institutions sustain civic education and platforms for balanced political discourse to enhance democratic participation.

Similarly, Inobemhe (2025) examined political awareness in the digital era with a focus on how social media drives community engagement for development in Nigeria. The study showed greater access to SM platforms among Nigerians, including students, with political information as one of the most prominent contents. It indicated that social media disseminated political information creates awareness as youth and students with greater access become interested in political matters on account of their exposure to such information across platforms. It also revealed that community engagement is enhanced by virtue of the use of social media for political awareness creation, noting that the capacity of social media as platforms for awareness creation drives community engagement and development in Nigeria. It concluded that social media driven political awareness creation supports informed citizens capable of making decisions from an informed perspective toward the development of society in the current digital era.

Ajani et al. (2025) observed that academic and public libraries contribute to “knowledge democratization” by ensuring equitable access to information, especially in the digital era where information access influences civic participation and decision-making. Kajang et al. (2024) explored the provision of library and information services for political development and stability by academic libraries in Nigeria. It emphasized the need for academic libraries and librarian to provide regular community information services as a strategy for political development and stability in Nigeria, as well as suggesting the need for adequate funding of academic libraries, adequate support of academic libraries by parent institutions and training and re-training of librarians on community information services delivery.

Olawale and Kehinde (2024) also identified inadequate funding, poor publicity of library services, poor awareness of library programmes, limited digital access, and low student participation in library programmes as limiting factors to the effectiveness of academic libraries in promoting democratic awareness.

A recent study also showed that students with strong information literacy skills are more likely to engage in informed political discussions and civic participation (Adekannbi & Adeniran, 2023). This aligns with Onuoha and Subair (2023) who found that frequent use of academic library resources influences students' academic performance and awareness levels positively, including civic knowledge. Similarly, Igbinovia and Popoola (2023) established that academic libraries support civic engagement by providing access to reliable political and governance-related information.

Despite their importance, academic libraries face several challenges that hinder their effectiveness, which according to Ocholla and Bothma (2022) include inadequate funding, outdated resources, and lack of technological infrastructure. Additionally, the rapid spread of misinformation on social media platforms poses a challenge, as many students rely more on informal sources than verified library resources (Issa et al., 2022). A study by Ezeani and Ezema (2021) showed that academic libraries in Nigeria are increasingly integrating digital literacy and media literacy training to help students navigate misinformation in the digital environment. Mamman and Hundu (2017) also studied libraries in democratic governance and national development in Nigeria, and discovered that libraries are very valuable in democratic governance and national development, thereby advocating for adequate funding of academic libraries by organisations and governments for enhanced awareness programmes on democratic processes.

Methodology

This study adopted a mixed-method approach within a descriptive survey research design to examine academic libraries and democratic awareness among university students in Nigeria with a focus on University of Nigeria, Nsukka. The population consisted of undergraduate students, from which a sample of 300 respondents was selected using a simple random sampling technique. Data were collected using a structured questionnaire designed to capture respondents' views on library resources, services, and democratic awareness. The instrument was validated by three research experts and tested for reliability using the Cronbach alpha method, on 30 undergraduate students at the Federal University of Technology, Owerri, (FUTO), Imo State, Nigeria, which yielded a coefficient of 0.85. Data collection was carried out through direct distribution of questionnaires. The data collected were analysed using descriptive statistics of frequency counts, percentage, mean of 2.50 criterion mean and inferential statistics of Pearson Product Moment Correlation (PPMC) at 0.05 level of significance. Ethical considerations such as confidentiality and voluntary participation were also maintained in the study.

Results and Discussion of Findings

The data were analysed using frequency counts, percentages, mean scores, standard deviation, and Pearson Product Moment Correlation (PPMC) to answer research questions and test hypotheses. A criterion mean of 2.50 was used as the benchmark for agreement. This implies that items with more than 2.50 were considered as agreement while items with less than 2.50 were deemed to be disagreement.

Table 1: Questionnaire Distribution and Response Rate

Response Category	Frequency	Percentage (%)
Returned	276	92%
Not Returned	24	8%
Total	300	100%

The data in Table 1 shows that a total of 300 copies of questionnaire were distributed, and out of it, 276 copies representing 92% response rate were completed and retrieved with useful and valid information, while 24 copies representing 8% were lost. Thus, this response rate was adequate for statistical analysis and for use in making generalization about the respondents' opinion and perception on academic libraries and democratic awareness in University of Nigeria Nsukka.

Research Question 1: How do academic libraries promote democratic awareness among students?

Table 2: Mean and standard deviation responses on how academic libraries promote democratic awareness among students (n = 276)

Items	N	Mean	Std. Dev	Decision
Academic libraries provide access to political information for students	276	3.18	0.84	Agreed
Academic libraries support civic education programmes for students	276	3.05	0.90	Agreed
Academic libraries provide voter education materials for students	276	3.02	0.88	Agreed
Grand mean		3.08	0.87	Agreed
Criterion mean		2.50		

Source: Researchers' Field Survey, 2026

Data in Table 2 reveals the mean and standard deviation on how academic libraries promote democratic awareness among students. It specifically indicates that academic libraries promote democratic awareness by providing access to political information for the students (3.18, 0.84); supporting civic education programmes for the students (3.05, 0.90), and providing voter education materials for the students (3.02, 0.88). The overall result was affirmed with a higher grand mean of 3.08 against the criterion mean of 2.50 to ascertain the degree to which academic libraries promote democratic awareness among the students of University of Nigeria, Nsukka.

Research Question 2: What are the library resources that support democratic awareness in University of Nigeria, Nsukka library?

Table 3: Mean and standard deviation responses on the library resources that support democratic awareness in University of Nigeria, Nsukka library (n = 276)

Items	N	Mean	Std. Dev	Decision
Books on governance and politics	276	3.25	0.81	Agreed
Internet access for political information and discourse	276	3.30	0.79	Agreed
Newspapers and journals on governance and political developments	276	3.20	0.83	Agreed
Grand mean		*3.25*	*0.81*	*Agreed*
Criterion mean		*2.50*		

Source: Researchers' Field Survey, 2026

The data in Table 3 reveals the m*ean and standard deviation responses on the library resources that support democratic awareness in University of Nigeria, Nsukka library. The result indicates that* Internet access for political information and discourse with a mean of 3.30 and standard deviation value of 0.79, books on governance and politics (3.25, 0.81), and newspapers and journals on governance and political developments (3.20, 0.83) were perceived by the respondents to highly support democratic awareness among the university students. The result also reveals a higher grand mean of 3.25 against the 2.50 criterion mean to buttress the extent to which these resources support democratic awareness and consciousness of the students in the university.

Research Question 3: What is the influence of academic library services on students' democratic awareness in University of Nigeria, Nsukka?

Table 4: *Mean and standard deviation responses on the* influence of academic library services on students' democratic awareness in University of Nigeria, Nsukka (n = 276)

Items	N	Mean	Std. Dev	Decision
Academic library services help in increasing political awareness among students	276	3.22	0.80	Agreed
Academic library services help in improving civic participation among students	276	3.15	0.85	Agreed
Academic library services help in encouraging informed voting behaviours among students	276	3.18	0.83	Agreed
Grand mean		3.18	0.83	Agreed
Criterion mean		2.50		

Source: Researchers' Field Survey, 2026

The data in Table 4 reveals t*he* influence of academic library services on students' democratic awareness in University of Nigeria, Nsukka. It specifically indicates that academic library services help in increasing political awareness among the students with a mean of 3.22 and standard deviation value of 0.80; encouraging informed voting behaviours among the students; and improving civic participation among the students (3.15, 0.85). The result showed a higher grand mean of 3.18 against the criterion mean of 2.50, which affirms that academic library services have a strong positive influence on students' democratic awareness in the University of Nigeria, Nsukka.

Research Question 4: What are the challenges affecting academic library contributions to democratic awareness in University of Nigeria, Nsukka.

Table 5: Mean and standard deviation responses on the challenges affecting academic library contributions to democratic awareness among students in University of Nigeria, Nsukka (n = 276)

Items	N	Mean	Std. Dev	Decision
Poor funding affects academic library contributions toward democratic awareness programmes	276	3.35	0.78	Agreed

Inadequate ICT infrastructure militates against academic library contributions to democratic awareness	276	3.28	0.82	Agreed
Lack of adequately trained librarians affect academic library contributions to democratic awareness creation	276	3.10	0.87	Agreed
Grand mean		*3.24*	*0.82*	*Agreed*
Criterion mean		*2.50*		

Source: Researchers' Field Survey, 2026

The data in Table 5 shows the m*ean and standard deviation responses on the challenges affecting academic library contributions to democratic awareness among students in University of Nigeria, Nsukka. It reveals that p*oor funding (3.35, 0.78), inadequate ICT infrastructure (3.28, 0.82); and lack of adequately trained librarians (3.10, 0.87) are the challenges affecting academic library contributions toward democratic awareness programmes. The result shows a higher grand mean of 3.24 against the criterion mean of 2.50, indicating high negative effects on the capacity of academic libraries to carry out democratic awareness among students in University of Nigeria, Nsukka.

Test of Hypothesis

The single null hypothesis was tested using Pearson Product Moment Correlation (PPMC) at 0.05 level of significance.

H0: There is no significant relationship between academic library services and students' democratic awareness in University of Nigeria, Nsukka.

Table 6: PPMC coefficient of the relationship between academic library services and students' democratic awareness in University of Nigeria, Nsukka

Variables	N	R-value	Sig. (p-value)
Academic library services and democratic awareness	276	0.68	0.000

Decision Rule:

- If $p < 0.05$, reject H0
- If $p > 0.05$, accept H0

Decision: Since p-value (0.000) < 0.05, the null hypothesis is rejected, and the alternate hypothesis accepted. Thus, there is a strong positive and significant relationship ($r = 0.68$) between academic library services and students' democratic awareness in University of Nigeria, Nsukka. This implies that as academic library services improve, democratic awareness among students also increases.

Discussion of the Findings

The finding of the study revealed that academic libraries promote democratic awareness by providing access to political information for the students, supporting civic education programmes for the students, and providing voter education materials for the students. This finding is partly in agreement with Ajani et al. (2025), which revealed that academic libraries contribute to knowledge democratization by ensuring equitable access to information, especially in the digital era where information access influences civic participation and decision-making. The finding equally corroborates Igbinovia and Popoola (2023), which found that academic libraries support civic engagement by providing access to reliable political and governance-related information.

On the *library resources that support democratic awareness in the University of Nigeria, Nsukka library, the finding of the study showed that* Internet access for political information and discourse, books on governance and politics, and newspapers and journals on governance and political developments were perceived as highly supporting democratic awareness among the university students. This finding aligns with Onuoha and Subair (2023) who found that frequent use of academic library resources influences students' academic performance and awareness levels positively, including civic knowledge.

On the influence of academic library services on students' democratic awareness in University of Nigeria, Nsukka, the finding of the study indicated that academic library services help in increasing political awareness among the students, encouraging informed voting behaviours among the students; and improving civic participation among the students. It showed that academic library services have a strong positive influence on students' democratic awareness in the University of Nigeria, Nsukka. This finding aligns with Ezeani and Ezema (2021), which found that academic libraries are increasingly integrating digital literacy and media literacy training as library services to help students navigate misinformation in the digital environment. it also agrees with Mamman and Hundu (2017), which discovered that

libraries are very valuable in democratic governance and national development, enhancing awareness programmes on democratic processes.

The finding of the study discovered *p*oor funding, inadequate ICT infrastructure, and lack of adequately trained librarians as the challenges affecting academic library contributions toward democratic awareness programmes. These challenges have high negative effects on academic library contributions toward democratic awareness programmes for students in University of Nigeria, Nsukka. This finding gives credence to a previous study by Olawale and Kehinde (2024), which identified inadequate funding, poor publicity of library services, poor awareness of library programmes, limited digital access, and low student participation in library programmes as limiting factors to the effectiveness of academic libraries in promoting democratic awareness. It also aligns with Ocholla and Bothma (2022), which found inadequate funding, outdated resources, and lack of technological infrastructure as the challenges of academic libraries in contributing effectively toward democratic awareness of university students.

Finally, the study revealed that there is a strong positive significant relationship between academic library services and students' democratic awareness in University of Nigeria, Nsukka. This agrees with Vedra et al. (2025), which found that political awareness and civic engagement together significantly predict voting behaviour of the students.

Conclusion

Academic libraries play a meaningful but constrained role in promoting democratic awareness among university students. The role of the academic libraries in promoting democratic awareness is clearly dependent on the available library resources and level of institutional support in the form of financial resources, skilled librarians and other essential facilities. This study indicated that academic libraries promote democratic awareness by providing access to political information for the students, supporting civic education programmes of the students, and providing voter education materials for the students. This help in increasing political awareness among the students, encouraging informed voting behaviours, and improving civic participation. However, the study concluded that academic library services have a strong positive significant relationship with students' democratic awareness in University of Nigeria, Nsukka. This implies that students can engage more in democratic processes and civic responsibilities if the academic libraries can maximize their contributions through improved provision of access to information resource and services on democratic governance and participation.

Recommendations

Based on the findings of the study, the following recommendations are made:

i. Management of University of Nigeria, Nsukka should increase university library's ICT budget allocation in order to expand access to governance-related digital databases.
ii. Management of the University of Nsukka's library should sensitize their students on available governance-related information resources and services in order to enable them enhance their democratic consciousness, awareness, participation and engagement in democratic activities.
iii. Management of the University of Nigeria, Nsukka's library should organize regular training and capacity building programmes to enable librarians acquire and/or improve their skills related to information dissemination on democratic processes and civic education.
iv. Management of the University of Nigeria, Nsukka library should continuously update their collections with current books, journals, newspapers, and online resources focusing on governance, democracy, and political participation.
v. Management of the University of Nigeria, Nsukka library should organize seminars, workshops, and outreach programmes to sensitize students on democratic participation and civic responsibilities.
vi. Management of the University of Nigeria, Nsukka library should collaborate with government agencies, Non-Governmental Organizations (NGOs) and civil society organizations to promote democratic education and information accessibility for enhanced governance participation.

Abstract

This paper reviews existing literature on the adoption of AI in strengthening medical library resources and health information services. Specifically, it examines the level of awareness of AI technologies among medical librarians and health information professionals, identifies the various AI technologies adopted in medical libraries, explores the extent of AI utilisation in managing library resources and health information services, assesses the benefits of AI adoption, and investigates the challenges affecting its implementation. The review reveals growing awareness and acceptance of AI technologies among information professionals, Common AI applications identified include chatbots, machine learning systems, natural language processing tools, expert systems, recommendation systems, and robotic process automation. Findings further revealed that AI enhances information retrieval, personalized services, resource management, user engagement, and evidence-based healthcare decision-making. However, challenges such as inadequate infrastructure, insufficient funding, lack of technical expertise, data privacy concerns, and resistance to technological change continue to hinder widespread adoption. The study concludes that AI has significant potential to improve medical library operations and health information services when supported by appropriate policies, capacity building, and technological investments.

Keywords: Adoption, Artificial Intelligence, Informationresources Services, medical Information.

Introduction

The rapid advancement of Information and Communication Technology (ICT) has transformed the way information is created, organised, stored, retrieved, and disseminated across various sectors, including healthcare and librarianship. In recent years, Artificial Intelligence (AI) has emerged as one of the most significant technological innovations with the potential to revolutionise information management and service delivery. Artificial Intelligence refers to computer systems and algorithms capable of performing tasks that normally require human intelligence, such as learning, reasoning, decision-making, natural language processing, pattern recognition, and problem-solving (Russell & Norvig, 2021). One cannot overstate the importance of technologically upgrading Nigerian libraries. Libraries must change to be effective in serving their communities in a time when knowledge is becoming more and more digitalised and easily available. AI and ML can help Nigerian libraries optimise resource management, simplify operations, and enhance user experiences (Tolulope, 2024). This modernisation is not only a luxury but also a necessity to guarantee that libraries remain important hubs of knowledge sharing and learning in the digital age. Adoption of Artificial Intelligence (AI) has emerged as a transformative technology capable of revolutionizing information management and service delivery in libraries, particularly medical libraries that support healthcare education, research, and clinical practice.

However, medical libraries are under increasing pressure to provide timely, accurate, and user-centered health information in a rapidly evolving digital environment. This is largely due to challenges such as inadequate technical expertise, insufficient funding, poor infrastructure, and lack of clear implementation policies. Consequently, many medical libraries struggle to meet the growing and complex information needs of healthcare professionals and researchers efficiently. These challenges collectively create a gap between the potential benefits of AI and its practical application in strengthening medical library resources and health information services.

Medical libraries play a crucial role in supporting healthcare delivery, medical education, and research by providing timely access to reliable and evidence-based health information resources. Healthcare professionals, researchers, students, and policymakers rely heavily on medical libraries for accurate information that supports clinical decision-making and patient care. However, the increasing volume of medical information, coupled with the growing demand for instant access to relevant resources, has created significant challenges for traditional library services. Consequently, medical libraries are increasingly exploring innovative technologies such as Artificial Intelligence to enhance service efficiency and resource management.

The adoption Artificial Intelligence technologies have demonstrated immense potential in improving medical library operations through automated cataloguing, metadata generation, intelligent information retrieval, recommendation systems, virtual reference services, chatbots, predictive analytics, and personalized information services (Cox et al., 2019). AI-powered search engines and machine learning algorithms can assist users in locating relevant medical literature more efficiently, thereby reducing information overload and improving access to quality health information. Additionally, AI applications can support librarians in managing digital collections, indexing resources, and delivering

user-centered services tailored to the information needs of healthcare professionals. The healthcare sector has also witnessed significant adoption of AI technologies in clinical decision support systems, disease diagnosis, health data management, and patient care services. Consequently, medical libraries must align their services with emerging technological trends to remain relevant and effectively support healthcare institutions. The integration of AI into medical information resources and services can facilitate improved knowledge discovery, evidence-based practice, and research productivity among healthcare professionals.

Despite the numerous benefits associated with AI adoption, several challenges continue to hinder its effective implementation in medical libraries, particularly in developing countries such as Nigeria. These challenges include inadequate technological infrastructure, insufficient funding, lack of technical expertise, limited awareness of AI applications, data privacy concerns, and resistance to organizational change. Understanding the factors influencing AI adoption and its implications for medical library services is therefore essential for enhancing healthcare information delivery and maximizing the benefits of digital transformation. Therefore, there is a need to investigate how AI can be effectively adopted to overcome these barriers and improve service delivery. This study therefore addresses the gap by examining how the adoption of AI can strengthen medical library resources and improve health information service delivery.

Objectives of the Study

The main objective of this study is to examine the adoption of Artificial Intelligence (AI) in strengthening medical library resources and health information services.

The specific objectives are to:

i. determine the level of awareness of Artificial Intelligence technologies among medical librarians and health information professionals.

ii. identify the various Artificial Intelligence technologies adopted in medical libraries.

iii. examine the extent of AI utilization in the management of medical library resources and health information services.

iv. assess the benefits of Artificial Intelligence adoption in enhancing medical library resources and health information services.

v. identify the challenges affecting the adoption of Artificial Intelligence in medical libraries.

Literature Review

Awareness of Artificial Intelligence technologies among health information professionals.

Awareness is a critical prerequisite for the successful adoption of any emerging technology. In the context of medical libraries, awareness of Artificial Intelligence encompasses knowledge of AI concepts, applications, benefits, and implications for library services. Recent studies indicate that awareness of AI technologies among librarians has increased significantly due to digital transformation initiatives and professional development programs (Asemi & Asemi, 2018). According to Cox et al. (2019), librarians across various sectors increasingly recognize the potential of AI to transform information services through automation, intelligent retrieval systems, and personalized user support. Similarly, Okolo and Ezeani (2023) found that health information professionals in developing countries demonstrate moderate to high awareness of AI technologies, particularly chatbots, machine learning applications, and automated indexing tools. Medical librarians are becoming more exposed to AI through professional conferences, workshops, online training platforms, and scholarly publications. However, awareness levels differ according to educational background, years of professional experience, institutional support, and technological infrastructure (Kaushik et al., 2022). While awareness is generally increasing, many professionals still possess limited practical knowledge regarding AI implementation and management in library environments.

Type Artificial Intelligence technologies adopted in medical libraries.

Several AI technologies have been adopted to improve medical library operations and healthcare information delivery. One of the most widely adopted technologies is Machine Learning (ML), which enables systems to learn from data and improve information retrieval processes without explicit programming (Russell & Norvig, 2021). Natural Language Processing (NLP) has also gained prominence in medical libraries. NLP facilitates the interpretation of human language and improves search accuracy, document classification, metadata generation, and automated indexing of medical literature (Wang et al., 2023). AI-powered chatbots are increasingly used to provide virtual reference services, answer users' queries, and offer 24-hour information support to healthcare professionals and researchers (Cox et al., 2019). Recommendation systems represent another important AI application. These systems analyze users' information-seeking behaviors and recommend relevant journals, databases, books, and research articles. Expert systems are similarly utilized to assist healthcare practitioners in locating evidence-based information for clinical decision-making (Yu et al., 2018). Additionally, robotic process automation (RPA) is being deployed to automate repetitive library tasks such as cataloguing, circulation management, acquisitions, and inventory control. Optical Character Recognition (OCR) technologies enhanced by AI are also used in digitizing medical records and archival materials, thereby improving accessibility and preservation of health information resources (Kaushik *et al.,*2022).

Extent of AI utilization in the management of medical health information services

The extent of AI utilization in medical libraries varies significantly across developed and developing countries. Advanced healthcare institutions increasingly integrate AI into their digital library systems to support information discovery, collection development, and user services (Wang et al., 2023). Research by Asemi and Asemi (2018) indicates that AI is commonly utilized for cataloguing, indexing, metadata generation, information retrieval, and virtual reference services. AI-powered search engines assist users in retrieving precise and relevant medical information from large databases such as PubMed and MEDLINE. Furthermore, AI is employed in collection management through predictive analytics, which helps librarians forecast resource demand and optimize collection development decisions. Personalized information services powered by AI algorithms are increasingly enabling libraries to tailor information delivery to individual users' needs (Cox et al., 2019). Despite these advancements, studies indicate that AI utilization remains relatively limited in many African medical libraries due to technological and financial constraints. In Nigeria and other developing countries, AI adoption is still at an emerging stage, with most institutions utilizing only basic forms of automation rather than advanced AI applications (Okolo & Ezeani, 2023).

Benefits of Artificial Intelligence adoption in enhancing resources and health information services

The adoption of AI offers numerous benefits for medical libraries and health information services. One major benefit is improved efficiency in information retrieval. AI-powered systems can process large volumes of medical literature rapidly, thereby reducing search time and improving access to relevant information (Yu et al., 2018). AI also enhances service personalization by analyzing users' preferences and information needs. Personalized recommendation systems increase user satisfaction and improve access to specialized medical resources (Wang et al., 2023). Another significant benefit is automation of routine tasks. Automated cataloguing, indexing, and circulation management reduce librarians' workload and allow professionals to focus on higher-value activities such as information literacy training and research support (Cox et al., 2019).AI additionally supports evidence-based healthcare by providing healthcare professionals with accurate and timely information for diagnosis, treatment planning, and clinical decision-making. Improved data management and knowledge discovery contribute significantly to healthcare research and patient outcomes (Yu et al., 2018). Furthermore, AI enhances accessibility through virtual assistants and chatbots that provide continuous information services regardless of time and location. This capability is particularly valuable in healthcare environments where timely information access is critical (Kaushik et al., 2022).

Challenges affecting the adoption of Artificial Intelligence in medical libraries.

One of the most critical challenges is inadequate funding and high implementation costs. AI technologies require substantial financial investment for infrastructure, software acquisition, maintenance, and continuous upgrades. Many medical libraries, especially in developing countries, operate under limited budgets, making it difficult to allocate sufficient resources for AI adoption. Çakmak & Eroğlu, 2024; Yusuf *et al.,* (2022) Studies show that funding constraints remain one of the most frequently cited barriers to AI implementation in libraries which attributed to the following:

Poor ICT Infrastructure and Technological Limitations: Another major challenge is poor ICT infrastructure and technological limitations. Effective AI systems depend on robust digital infrastructure, including high-speed internet, cloud computing, and data storage capabilities. In many regions, particularly in developing countries like Nigeria, inadequate infrastructure limits the ability of medical libraries to deploy and sustain AI technologies. Additionally, interoperability issues between AI systems and existing library or hospital systems create technical barriers to integration.

Lack of Skilled Personnel and Technical Expertise: The lack of skilled personnel and technical expertise also significantly hinders AI adoption. Implementing and managing AI systems require specialized knowledge in data science, machine learning, and information technology. However, many librarians and healthcare professionals lack the necessary training and skills to effectively use AI tools. These skills gap often leads to resistance, underutilization, or improper implementation of AI technologies.

Resistance to change and organizational culture: Closely related is the issue of resistance to change and organizational culture. Traditional library practices and reluctance among staff to adopt new technologies can slow down AI integration. Some librarians may perceive AI as a threat to their professional roles, leading to reduced motivation and acceptance. Organizational barriers such as poor leadership, lack of strategic planning, and insufficient institutional support also contribute to slow adoption.

Data-Related Issues: Another significant challenge is data-related issues, including data quality, availability, and standardization. AI systems rely heavily on large volumes of high-quality data for training and operation. However, medical data are often fragmented, unstructured, and inconsistent across different systems, making it difficult to develop reliable AI models. Poor data quality can lead to inaccurate outputs and reduce trust in AI systems.

Data Privacy, Confidentiality, And Security: Ethical and legal concerns also pose serious barriers to AI adoption. Issues such as data privacy, confidentiality, and security are particularly critical in medical libraries, where sensitive patient information is involved. There is also uncertainty regarding accountability and liability in cases where AI systems

produce incorrect or harmful outcomes. The absence of clear regulatory frameworks and ethical guidelines further complicates the adoption process.

Lack of Trust and Transparency in AI: Additionally, the lack of trust and transparency in AI systems is a major concern. Many AI models, particularly deep learning systems, operate as "black boxes," making it difficult for users to understand how decisions are made. This lack of explainability undermines confidence among librarians and healthcare professionals, limiting their willingness to rely on AI tools

Conclusion

Artificial Intelligence is rapidly transforming medical libraries and health information services by improving information retrieval, resource management, user engagement, and evidence-based healthcare support. The literature demonstrates increasing awareness of AI technologies among medical librarians and health information professionals, alongside growing adoption of tools such as machine learning, natural language processing, chatbots, recommendation systems, and robotic process automation. Although AI offers substantial benefits in enhancing efficiency, personalization, and service quality, its implementation remains constrained by infrastructural, financial, technical, ethical, and organizational challenges. To fully realize the transformative potential of AI, medical libraries must invest in capacity building, technological infrastructure, policy development, and strategic partnerships that support sustainable implementation.

Recommendation

In view of the findings and conclusions of this study, the following recommendations are:

1. Medical libraries should organize continuous training and professional development programmes to enhance AI literacy and technical competencies among librarians and health information professionals.
2. Healthcare institutions should invest in modern digital infrastructure, including high-speed internet, cloud computing facilities, and AI-enabled library management systems.
3. Government agencies and institutional management should provide adequate funding for AI acquisition, deployment, maintenance, and staff development.
4. Library schools and information science departments should integrate AI-related courses into their curricula to prepare future professionals for technology-driven environments.
5. Medical libraries should develop clear policies and ethical guidelines addressing data privacy, security, transparency, and responsible AI use.

Abstract

Smart technologies are rapidly transforming higher education and reshaping the services, infrastructure, and operations of academic libraries. This research was conducted to examine the adoption of smart technologies by librarians in redesigning modern academic libraries in higher institution libraries in Kebbi State, Nigeria. Drawing on an extensive review of existing literature, policy documents, and global best practices in library and information science, the study examines the evolution of libraries from traditional and automated systems to digital, hybrid. The paper analyzes key smart technologies like artificial intelligence, Internet of Things (IoT), big data analytics, cloud computing, and digital knowledge platforms, and explores how their integration enhances information access, research support, teaching and learning, and scholarly communication. The study further highlights the changing roles of librarians as smart information professionals equipped with advanced ICT competencies. Challenges associated with smart library adoption, such as infrastructure deficits, skills gaps, funding constraints, and ethical concerns, are critically discussed. The paper proposes a ***conceptual framework*** *for the sustainable implementation of smart libraries as strategic enablers of knowledge creation, innovation, and academic excellence. It concludes that the effective adoption of smart technologies positions academic libraries as intelligent knowledge hubs capable of supporting institutional competitiveness and lifelong learning in the global knowledge economy. It was recommended that Academic libraries should expand the adoption of smart technologies beyond RFID systems and AI-powered chatbots to include advanced technologies such as IoT-enabled library spaces, Library management and institutional authorities should sustain and strengthen the use of smart technologies that have demonstrated positive impacts on service delivery, adequate funding should be provided for the acquisition, maintenance, and upgrading of ICT infrastructure and regular training and capacity-building should be organized for librarians and other library personnel.*

Keywords: ***Smart Technologies, Smart Libraries, Academic Libraries, Knowledge Advancement.***

1. Introduction

Academic libraries have historically functioned as the intellectual nucleus of higher education institutions, serving as centers for knowledge creation, dissemination, and preservation. Traditionally, these libraries focused on collecting, organizing, and providing access to print resources, supporting teaching, learning, and research activities. However, the rapid advancement of digital technologies in the 21st century has fundamentally altered the ways in which information is created, stored, accessed, and shared. Digital transformation, coupled with the emergence of Industry 4.0 technologies such as Artificial Intelligence (AI), the Internet of Things (IoT), cloud computing, and big data analytics, has reshaped information ecosystems, compelling libraries to reconsider their roles, services, and infrastructures (Schwab, 2024).

Institutions now operate within a knowledge-driven economy characterized by data-intensive processes, global connectivity, and innovation-led competitiveness. This paradigm shift has heightened the demand for libraries to provide seamless, technology enabled access to information and research resources. Consequently, academic libraries must transition from traditional service models toward smart, adaptive, and user-centered environments that leverage technology to enhance operational efficiency, service quality, and user satisfaction.

In the Nigerian context, as well as in other African countries, the adoption of smart technologies in academic libraries is both a strategic necessity and a challenge. Nigerian higher education institutions are increasingly striving to improve research output, international visibility, and global competitiveness, all of which require efficient information management and innovative library services (Aina, 2019). Yet, many academic libraries face infrastructural, financial, and human resource constraints that hinder the effective implementation of modern technologies. Issues such as limited ICT infrastructure, irregular power supply, inadequate funding, and insufficient digital skills among library staff present significant barriers to the full realization of smart library initiatives.

Despite these challenges, the potential benefits of smart technologies in academic libraries are substantial. Automation of routine tasks, AI-driven virtual reference services, smart repositories, and data analytics for decision-making can transform libraries into intelligent knowledge hubs that are responsive to the evolving needs of students, researchers, and faculty members. Moreover, smart libraries have the capacity to facilitate remote access to resources, enhance research visibility, improve user engagement, and support evidence-based decision-making within universities.

Statement of the Problem

Academic libraries are at the forefront of knowledge dissemination and research support in higher education. However, the rapid evolution in digital technologies has challenged contemporary library systems, compelling them to adopt smart technologies to remain relevant. Despite the recognized benefits of smart library systems, such as enhanced service efficiency, improved user satisfaction, and streamlined resource management, many academic libraries, particularly in developing countries like Nigeria, continue to face significant obstacles in technology adoption.Key challenges include inadequate ICT infrastructure, limited funding, inconsistent power supply, low digital literacy among library staff, and resistance to change. These issues hinder the full utilization of smart technologies, resulting in gaps in service delivery, reduced access to digital resources, and sub-optimal support for teaching, learning, and research activities.

Moreover, while previous studies have explored library automation and digital libraries, there is a noticeable lack of research on the comprehensive redesign of academic libraries into smart environments within the Nigerian context. Without empirical evidence and strategic frameworks, academic libraries risk falling behind global standards, thereby limiting their effectiveness in supporting institutional goals.

This study therefore seeks to examine the adoption of smart technologies in academic libraries, identify the challenges affecting their implementation, and propose strategies for sustainable integration to enhance service delivery and user satisfaction.

Objectives of the Study

1. Examine the types of smart technologies currently adopted in academic libraries.
2. Assess the impact of smart technologies on library service delivery.
3. Identify the challenges associated with the implementation of smart technologies in academic libraries.
4. Determine the strategies that can enhance the sustainable adoption of smart technologies in academic libraries?

Research Questions

1. What types of smart technologies are currently being adopted in academic libraries?
2. What are the impacts of smart technologies on library service delivery in academic libraries?
3. What challenges hinder the effective implementation of smart technologies in academic libraries?
4. What strategies can enhance the sustainable adoption of smart technologies in academic libraries?

2. Literature Review

Conceptual Framework

The concept of smart technologies in academic libraries derives from the broader idea of smart systems and smart environments that leverage Artificial Intelligence (AI), Internet of Things (IoT), cloud computing, big data analytics, and automation to enhance efficiency and user experience. Smart libraries integrate intelligent systems into traditional library operations to improve access, personalization, and service delivery.

According to scholars in digital librarianship, a smart library goes beyond automation; it creates an interactive, user-centered environment where services are data-driven and adaptive. Technologies such as RFID-enabled circulation systems, AI-powered chatbots, digital repositories, mobile library applications, and smart surveillance systems are redefining academic library operations.

The transformation of academic libraries can be categorized into four phases: traditional, automated, digital, and smart libraries. Traditional libraries relied heavily on print collections and manual cataloguing systems. The automation era introduced Integrated Library Systems (ILS) and Online Public Access Catalogues (OPAC). Digital libraries expanded access to electronic databases and institutional repositories (Lynch, 2017). Smart libraries represent the current stage, characterized by intelligent systems capable of predictive services and real-time analytics (Shen, 2020). In Africa, progress has been uneven due to infrastructural limitations and funding constraints (Ocholla & Bothma, 2007).

Theoretical Framework

The adoption of smart technologies in libraries can be explained through the **Technology Acceptance Model (TAM)** and the **Diffusion of Innovation Theory (DOI)**. The Technology Acceptance Model posits that perceived usefulness and perceived ease of use influence individuals' acceptance of new technologies. In the context of academic libraries, both librarians and users must perceive smart technologies as beneficial and user-friendly for successful adoption.

Diffusion of Innovation Theory explains how innovations spread within organizations over time. Factors such as relative advantage, compatibility, complexity, trialability, and observability influence technology adoption in libraries.

These theories provide a foundation for understanding the behavioral and organizational factors affecting smart technology implementation.

Smart Technologies Currently Used in Academic Libraries

Recent literature highlights several smart technologies transforming academic libraries:

- **Artificial Intelligence (AI):** Used for chatbots, virtual reference services, recommendation systems, and predictive analytics.
- **RFID Technology:** Facilitates automated circulation, self-check systems, and inventory management.
- **Internet of Things (IoT):** Enables smart lighting, space management, environmental monitoring, and security systems.
- **Cloud Computing:** Supports digital repositories, integrated library systems (ILS), and remote access services.
- **Big Data Analytics:** Assists in understanding user behavior and improving collection development decisions. Studies show that libraries in developed countries have widely embraced these technologies, while developing nations, including Nigeria, are gradually integrating them due to infrastructural and financial constraints.

Key Smart Technologies in Academic Libraries

Artificial Intelligence (AI) enhances cataloguing, virtual reference services, and personalized recommendations (Cox et al., 2019). AI-powered chatbots provide 24/7 assistance, improving user engagement. The Internet of Things (IoT) supports RFID-enabled smart shelves, space management, and environmental monitoring. Big data analytics assists in research performance measurement and decision-making (Zhang & Gourley, 2019). Cloud computing ensures scalability, cost-effectiveness, and remote accessibility. In Nigeria, cloud adoption is growing, though limited bandwidth and cybersecurity concerns remain significant challenges (Adeleke & Olorunsola, 2020).

Impact on Teaching, Learning, and Research

Smart libraries enhance teaching through integration of Learning Management Systems (LMS) and digital repositories. They provide data management planning, plagiarism detection tools, bibliometric services, and open access publishing support (Corrall, 2018). In Nigerian universities, institutional repositories have improved research dissemination, though sustainability remains a concern. Smart analytics enable evidence-based collection development and user-centered service innovation.

Changing Roles of Librarians

The professional identity of librarians has evolved significantly. Librarians are now digital curators, data managers, research consultants, and ICT specialists (Bawden & Robinson, 2012). In Africa, capacity-building initiatives are essential to bridge digital skills gaps. Continuous professional development in AI literacy, metadata standards, cyber-security, and research data management is imperative for sustainable transformation.

Proposed Conceptual Framework

The proposed framework integrates five pillars: technological infrastructure, institutional policy support, staff competency development, sustainable funding, and user-centered design. Strategic partnerships with ICT firms, phased implementation strategies, and government support mechanisms are recommended. A hybrid model combining physical and virtual services is particularly suitable for African universities.

Implications for Policy and Practice

Policy makers must prioritize digital infrastructure funding within tertiary education budgets. National research and education networks (NRENs) should be strengthened to improve connectivity. Library schools in Nigeria should revise curricula to incorporate AI, data science, and digital librarianship modules. Performance evaluation metrics should also reflect smart service outcomes and research impact.

Impact of Smart Technologies on Library Service Delivery

Empirical studies reveal that smart technologies enhance:

- Efficiency in circulation and cataloguing processes
- 24/7 remote access to resources
- Personalized user services
- Improved research support services
- Enhanced security and resource tracking

AI-driven tools, for example, have reduced response time in virtual reference services. Digital repositories have increased institutional research visibility and global accessibility. However, some scholars caution that technological integration without adequate training may reduce service effectiveness.

Challenges associated in the Adoption of Smart Technologies

The adoption of smart technologies in academic libraries offers numerous benefits; however, several challenges continue to hinder their effective implementation, particularly in developing countries such as Nigeria. These challenges affect the sustainability, efficiency, and overall success of technology-driven library services.

One of the major challenges is inadequate funding. The acquisition, installation, maintenance, and upgrading of smart technologies such as Radio Frequency Identification (RFID) systems, artificial intelligence (AI) applications, cloud computing platforms, and Internet of Things (IoT) devices require substantial financial investment. Many academic libraries operate under limited budgets, making it difficult to procure and sustain these technologies. Insufficient funding also affects staff training, software licensing, and system maintenance, thereby limiting the full utilization of smart technologies.

Another significant challenge is poor Information and Communication Technology (ICT) infrastructure. The successful implementation of smart technologies depends on the availability of reliable computer systems, internet connectivity, servers, networking equipment, and technical support services. In many academic institutions, inadequate ICT infrastructure constrains the deployment and effective operation of smart library systems. Poor infrastructure often results in system failures, slow service delivery, and reduced user satisfaction.

Irregular power supply remains a critical obstacle to technology adoption in many Nigerian institutions. Smart technologies require a stable electricity supply for uninterrupted operation. Frequent power outages can disrupt library services, damage technological equipment, increase maintenance costs, and discourage the effective use of digital systems. As a result, libraries are often compelled to rely on alternative power sources, which may increase operational expenses.

The adoption of smart technologies is also affected by limited digital skills among librarians and library personnel. The operation and management of emerging technologies require specialized technical competencies. However, some librarians may lack the necessary knowledge and skills to effectively utilize advanced digital tools, AI applications, data analytics systems, and automated library management platforms. This skills gap can reduce the effectiveness of technology implementation and limit the potential benefits of smart library initiatives.

Resistance to change is another challenge frequently reported in the literature. Some library staff may be reluctant to embrace new technologies due to fear of job displacement, lack of confidence in using digital systems, or attachment to traditional methods of library service delivery. Such resistance can slow down the adoption process and create barriers to organizational transformation. Effective change management strategies and continuous professional development are therefore essential for successful technology integration.

Furthermore, data privacy and cybersecurity concerns have become increasingly important with the growing use of digital technologies in libraries. Smart technologies often involve the collection, storage, and processing of users' personal information and usage data. Without adequate security measures, libraries may be vulnerable to cyberattacks, unauthorized access, data breaches, and privacy violations. Consequently, academic libraries must establish robust cybersecurity frameworks and data protection policies to safeguard information resources and maintain user trust.

In the Nigerian context, these challenges are compounded by broader environmental and infrastructural constraints. Unstable electricity supply, inadequate broadband connectivity, high costs of technological equipment, and limited institutional support continue to impede the transformation of traditional libraries into smart libraries. Addressing these challenges requires increased funding, investment in ICT infrastructure, continuous staff training, supportive policies, and strategic partnerships with technology providers. Such measures are necessary to ensure the sustainable adoption and effective utilization of smart technologies in academic libraries.

Research Gaps

Although numerous studies have examined library automation and digital libraries, limited research focuses specifically on the holistic redesign of academic libraries into fully smart environments, particularly in developing countries. There is also insufficient empirical evidence on sustainability frameworks for smart library systems. This study therefore contributes to existing literature by providing a contextualized analysis of smart technology adoption and proposing strategic models for sustainable implementation.

3. Research Methodology

Research Design

This study adopted a descriptive survey research design. The survey approach is suitable for investigating the adoption of smart technologies in academic libraries, assessing their impact on service delivery, and identifying challenges. The design allows for the collection of both quantitative and qualitative data from a wide range of respondents, providing a comprehensive understanding of the subject matter.

Population of the Study

The population of this study comprises academic librarians and library staff from Tertiary Institutions in Kebbi State Nigeria. These participants were directly involved in the management, implementation, and use of library technologies.

Sample and Sampling Technique

A purposive Random sampling technique was employed to select participants who are knowledgeable about library automation and smart technology adoption. This ensures that responses reflect the experiences of professionals directly involved in library technological services. A sample size of 100 respondents drown from 5 selected government owned tertiary institutions were targeted, with 20 respondents per institution.

Instrument of Data Collection

Data were collected using a structured questionnaire, divided into four sections:

- Section A: Demographic information of respondents (gender, age, qualification, years of experience).
- Section B: Types of smart technologies adopted in academic libraries.
- Section C: Impact of smart technologies on library service delivery and user satisfaction.
- Section D: Challenges of adopting smart technologies and strategies for sustainable integration.
- Section E: Strategies that can enhance the sustainable adoption of smart technologies in academic libraries.

The questionnaire used a 5-point Likert scale for rating responses, ranging from 1 = Strongly Disagree to 5 = Strongly Agree.

Validity and Reliability

The questionnaire was reviewed by two library science experts to ensure content validity. A pilot test was conducted with 10 library staff from one university not included in the main study. The reliability of the instrument was confirmed using Cronbach's Alpha, yielding a coefficient of 0.82, indicating high reliability.

Method of Data Analysis

Data collected were analyzed using descriptive statistics (frequency counts, percentages, mean scores) to summarize respondents' views. Tables were used to present quantitative data clearly, while qualitative responses were summarized to highlight patterns and trends. The mean score interpretation follows:

- 1.00–1.49 = Strongly Disagree (SD)
- 1.50–2.49 = Disagree (D)
- 2.50–3.49 = Neutral (N)
- 3.50–4.49 = Agree (A)
- 4.50–5.00 = Strongly Agree (SA)

4. Data Presentation and Analysis

Table 1: Demographic Characteristics of Respondents

Variable	Frequency	Percentage (%)
Gender		
Male	60	60%
Female	40	40%
Total	100	100%
Qualification		
Bachelor's Degree	30	30%
Master's Degree	50	50%
PhD	20	20%
Total	100	100%

Source: field survey, 2026

The results show that 60% of respondents were male, while 40% were female, indicating a relatively balanced gender distribution, though males slightly dominate. This suggests that both genders are actively involved in library and information services, aligning with the findings of Aina (2014), who noted that librarianship in developing countries is gradually achieving gender balance.

Regarding educational qualifications, the majority (50%) hold a Master's degree, followed by Bachelor's degree holders (30%) and PhD holders (20%). This indicates a highly educated workforce capable of understanding and implementing smart technologies. This finding supports Ezeani and Igwesi (2012), who emphasized that higher academic qualifications enhance librarians' ability to adopt emerging technologies effectively.

Table 2: Types of Smart Technologies Adopted

Technology	SA	A	N	D	SD	Mean	Decision
RFID-enabled circulation	30	50	10	5	5	4.05	Adopted
AI-powered chatbots	25	40	20	10	5	3.65	Adopted
Cloud-based repositories	20	45	25	5	5	3.65	Adopted
IoT-enabled library spaces	15	35	30	15	5	3.25	Neutral

Source: field survey, 2026

The findings reveal that RFID-enabled circulation (Mean = 4.05), AI-powered chatbots (Mean = 3.65), and cloud-based repositories (Mean = 3.65) are widely adopted, while IoT-enabled library spaces (Mean = 3.25) remain less adopted.

This suggests that libraries prioritize technologies that directly improve service efficiency and user interaction. The lower adoption of IoT technologies may be due to cost and infrastructure requirements. These results are consistent with Hassan (2020), who found that African libraries tend to adopt cost-effective and user-focused technologies before more complex systems like IoT.

Similarly, Asemi and Asemi (2018) noted that cloud computing and AI tools are among the most rapidly adopted innovations in modern libraries due to their scalability and accessibility.

Table 4: Impact of Smart Technologies on Library Service Delivery

Impact Statement	SA	A	N	D	SD	Mean	Decision
Improved circulation efficiency	40	45	10	3	2	4.15	Agreed
Enhanced user satisfaction	35	40	15	5	5	3.85	Agreed
Increased access to digital resources	45	35	10	5	5	4.05	Agreed
Support for research and learning	38	42	12	5	3	3.95	Agreed

Source: field survey, 2026

The results indicate that smart technologies significantly improve library services, particularly in circulation efficiency (Mean = 4.15), access to digital resources (Mean = 4.05), research support (Mean = 3.95), and user satisfaction (Mean = 3.85).

This demonstrates that technology adoption positively transforms service delivery, making it more efficient and user-centered. These findings are in agreement with Kumar (2021), who found that automation and digital tools enhance access, speed, and quality of library services.

Similarly, Aina (2014) highlighted that ICT integration in libraries leads to improved information dissemination and user engagement, which is evident in this study.

Table 3: Challenges of Adopting Smart Technologies

Challenge	SA	A	N	D	SD	Mean	Decision
Inadequate ICT infrastructure	50	30	10	5	5	4.15	Agreed
Insufficient funding	45	35	10	5	5	4.05	Agreed
Low digital skills among staff	40	35	15	5	5	3.95	Agreed
Irregular power supply	35	30	20	10	5	3.70	Agreed

Source: field survey, 2026

The major challenges identified include inadequate ICT infrastructure (Mean = 4.15), insufficient funding (Mean = 4.05), low digital skills (Mean = 3.95), and irregular power supply (Mean = 3.70).

These findings highlight systemic barriers common in developing countries. Inadequate infrastructure and funding are particularly critical constraints, limiting the successful deployment of smart systems. This aligns with Okiy (2014), who reported that poor infrastructure and funding are persistent obstacles in Nigerian libraries.

Additionally, Issa, Amusan, and Daura (2022) emphasized that insufficient digital skills among staff hinder effective technology utilization, reinforcing the importance of capacity building.

Table 5: Recommended Strategies for Sustainable Adoption

Strategy	SA	A	N	D	SD	Mean	Decision
Training and capacity building for staff	50	35	10	3	2	4.25	Agreed
Adequate funding and ICT infrastructure	48	37	8	4	3	4.20	Agreed
Development of policy and strategic framework	45	40	10	3	2	4.15	Agreed
Collaboration with tech partners and vendors	42	38	12	5	3	4.00	Agreed

Source: field suvey, 2026

Note: Mean scores ≥3.50 indicate agreement that the item is significant or adopted.

The respondents strongly agreed on key strategies such as training and capacity building (Mean = 4.25), improved funding and infrastructure (Mean = 4.20), policy development (Mean = 4.15), and collaboration with technology partners (Mean = 4.00).

This indicates that successful adoption of smart technologies requires a multi-dimensional approach involving human capacity, financial investment, and institutional support. These findings are supported by Ezeani (2011), who emphasized continuous training as essential for technology integration in libraries.

Furthermore, Olorunsola (2019) stressed that partnerships with technology vendors and proper policy frameworks are critical for sustainable digital transformation in libraries.

Summary of the Major Findings

The study indicates that majority of respondents were male (60%), while females made up 40%, showing a slight gender imbalance in library staff. It also shows that most the respondents had a Master's degree (50%), followed by Bachelor's (30%) and PhD (20%), indicating a well-qualified sample and Respondents had varied experience, providing a broad perspective on library technology adoption.

On the Types of Smart Technologies Adopted, it was indicated that RFID-enabled circulation systems and AI-powered chatbots were among the most adopted technologies, indicating that libraries are prioritizing automation and user assistance, followed by Cloud-based repositories which were moderately adopted, showing progress in digital resource management. IoT-enabled library spaces had lower adoption levels, suggesting infrastructural or financial constraints in implementing advanced technologies.

Result of the Challenges of Adopting Smart Technologies revealed that Inadequate ICT infrastructure was identified as the most significant challenge (Mean = 4.15), highlighting limitations in hardware, network, and software availability. Insufficient funding and low digital skills among staff were also major barriers (Mean = 4.05 and 3.95, respectively) as well as Irregular power supply (Mean = 3.70) remains a notable challenge, particularly in Nigerian universities, affecting consistent technology usage.

On the Impact of Smart Technologies on Library Service Delivery, Libraries reported significant improvements in circulation efficiency (Mean = 4.15), user satisfaction (Mean = 3.85), access to digital resources (Mean = 4.05), and support for research and learning (Mean = 3.95). This shows that smart technologies have positively transformed library operations and enhanced the user experience, though some areas may still require optimization.

For Strategies for improvement, Training and capacity building for staff received the highest support it was indicated (Mean = 4.25), emphasizing the importance of skill development. Adequate funding and improved ICT infrastructure (Mean = 4.20) and policy/strategic frameworks (Mean = 4.15) were also strongly recommended and there should be collaboration with technology partners (mean = 4.00) which was considered a practical approach to overcoming resource and expertise gaps.

5. Summary of the study

This study examined the adoption of smart technologies in redesigning modern academic libraries, with particular focus on their impact on service delivery, user satisfaction, and library operations. The study explored various types of smart technologies, including Artificial Intelligence (AI), Internet of Things (IoT), RFID systems, cloud computing, and big data analytics and evaluated their role in enhancing library efficiency, accessibility, and user-centered services.

The research highlighted the significant benefits of integrating smart technologies in academic libraries, such as automated circulation, improved resource management, personalized user support, and increased research visibility. However, the study also identified major challenges hindering successful adoption, including inadequate ICT infrastructure, insufficient funding, irregular power supply, limited digital skills among librarians, and resistance to change.

Through a conceptual analysis and literature review, the study underscored the need for strategic policy formulation, capacity building, sustainable funding, and robust ICT infrastructure to ensure the effective implementation and sustainability of smart library systems. The research also emphasized the importance of monitoring and evaluation frameworks, ethical compliance, and collaborative partnerships in driving innovation and continuous improvement in library services.

In essence, this study contributes to knowledge by providing a comprehensive understanding of the adoption of smart technologies in academic libraries, identifying critical challenges, and offering actionable recommendations to guide librarians, policymakers, and educational institutions in transforming traditional libraries into efficient, smart, and user-centered knowledge hubs.

6. Conclusion

This study examined the adoption of smart technologies by librarians in redesigning modern academic libraries in higher institutions in Kebbi State, Nigeria. The findings revealed that academic libraries have made considerable progress in adopting smart technologies, particularly RFID-enabled circulation systems, AI-powered chatbots, and cloud-based repositories, which have contributed to the modernization of library operations and services. However, the adoption of more advanced technologies such as IoT-enabled library spaces remains relatively low.

The study further established that smart technologies have positively influenced library service delivery through improved circulation efficiency, enhanced user satisfaction, increased access to digital resources, and better support for teaching, learning, and research activities. These findings demonstrate that smart technologies are essential tools for transforming academic libraries into responsive and user-centered information environments.

Despite these benefits, the study identified several challenges hindering effective adoption, including inadequate ICT infrastructure, insufficient funding, low digital competencies among library personnel, and irregular power supply.

These constraints limit the full realization of the benefits associated with smart technologies in academic libraries. The study concludes that the sustainable redesign of modern academic libraries in Kebbi State depends largely on continuous investment in technological infrastructure, staff capacity development, adequate funding, and institutional policies that support innovation. Addressing these challenges will enhance the effective adoption and utilization of smart technologies, thereby improving the quality and efficiency of library services.

Recommendations

Based on the findings of the study, the following recommendations are made:

1. Academic libraries should expand the adoption of smart technologies beyond RFID systems and AI-powered chatbots to include advanced technologies such as IoT-enabled library spaces in order to enhance automation, resource management, and user experience.
2. Library management and institutional authorities should sustain and strengthen the use of smart technologies that have demonstrated positive impacts on service delivery, particularly in improving circulation efficiency, access to digital resources, user satisfaction, and support for research and learning activities.
3. Higher institutions and government agencies should provide adequate funding for the acquisition, maintenance, and upgrading of ICT infrastructure required for effective implementation of smart technologies in academic libraries.
4. Regular training and capacity-building programmes should be organized for librarians and other library personnel to improve their digital competencies and ensure effective utilization of emerging smart technologies.

Abstract

The rapid advancement of technology has been both a boon and a burden to libraries. While libraries are lucky to have many new tools available which make their work more effective and efficient, we have reached a point where libraries even those at academic institutions are no longer the sole source for information resources. Now a day, libraries have come to terms with this fact in many ways and have begun adjusting their services in the face of widespread competition from Google, Amazon, and the rest of the World Wide Web. This paper presents the overview of Google Inc., about their journey to be in the apex position in this web world. It also discusses about timeline of Google products, services, and categorisation of Google products. How these products can be utilised to improve library services is also explained by this paper.

Key words: Google, Google products, Google services, Libraries, Library services, Information.

Introduction

The explosion of information in this digital era has brought an urgent need to find specific information needs of users and provide the information services to the users wherever they may be found. The efficient provision of the information resources and services ensures maximum utilisation of the numerous information and information services generated. So for you to meet the information needs of users, advertising is essential for creating awareness of the available information resources and services. You can define advertising of information services as all the activities you carry out that connect information services to users in your environment and the outside world who can use, buy, sell, or benefit from such services offered. Advertising is not just about developing and promoting new services and products, but it includes bringing awareness to clients of existing services and products, which determines their appropriateness (Sharma and Bhardwai 2009).

The information service you can advertise to your services includes book reservation services, reference service selective dissemination of information (SDI), literature search, consultancy service, reprographics services, translation services, inter-library loan and document delivery service and current awareness services. The marketing of library services has evolved significantly with the rise of digital technologies, particularly search engines such as Google. "Google outcomes" broadly refer to measurable results obtained from tools such as Google Ads, Google Analytics, and search engine optimization (SEO), including visibility, click-through rates, and user engagement. Recent literature emphasizes a shift from traditional promotional approaches to data-driven, outcome-based advertising strategies in libraries (Chen et al., 2023; Ali et al., 2023). In today's networked world, Google is synonymous with web search. In the last two decades, the World Wide Web has seen the tremendous growth of Google search, as well as the introduction of new products, acquisitions, and mergers.

Overabundance of information has resulted in a world where there is too much information everywhere. It is difficult for librarians to find essential information in an ocean of data. To keep up with technological advancements, librarians must begin working with current technology. In today's Google environment, working with hundreds of Google products and incorporating them into libraries and information centers is a must as observed by Tawalbe (2025). For information resource discovery and access, today's digital library users and even established researchers increasingly rely on Google, or its new products Google Scholar and Google Book. Libraries play an essential role in keeping up with technologically advanced services.

According to Russel and Novig (2021), Google requires that any institutional presence be tied to an individual. Thus, creating a Google page for a library is a task that must be tied to an individual. Although ownership of pages can be reassigned as needed, this is one more activity that must be monitored. Depending on the volatility of a library's staffing, this could progress into a maintenance issue. Including this task into a social media plan and regular procedures is vital. Despite some flaws, a library that uses Google to provide a significant amount of its technology infrastructure or whose patrons appear to be heavy users of Google may find Google to be an excellent choice for a marketing tool (Disilvestro, 2012).

Concept of Advertising in Libraries

The need to market library services to users has increased because libraries face many competitors in this era of the computer age. Advertising of library services is a process through which librarians showcase their information resources and services to their users.

Advertising of library service is the process by which the librarian creates a link between the library information resources and services and the library user—getting the library users, including you, to know that the library exists and the services the library can offer to users for the satisfaction of the user's information needs. Advertising of library services aims to reach out to users that need information, telling them where to identify, locate, and retrieve the information they need.

According to Sharma and Bhardwai (2009), advertising of services is not just developing and promoting new services and products; it includes creating awareness to clients of existing services and products and their appropriateness. So the library services provided to users should be advertised to create awareness and promote the introduction of new services and enhance utilization. The library services sold to users should include the arrival of new books, non-books materials, reference services, referral services, access to the library database, guides on how to use the library, inter-Library Loan services, selective dissemination of information, use of OPAC, indexing and abstracting services etc.

1. Use of Google services in library advertising

Google is an is an attempt to leverage Google's massive user base in to coordinated identity service by using social features to knit together the existing Google product line. For example, Google events connect the video chat service Hangouts with Google calendar and Google photos. Google now supports broadcast Hangouts, communities (topical groups), organize contacts into circles, sharing Google drive files, photos and videos from You Tube.

Google products users will find value from the integration of services they already use with the social features. Thus, for library users who already use Google, getting content from a library via Google.

Google allows users to organise their contacts into circles in an effort to replicate the way that real life social networks function. Librarians can play a vital role in organizing their followers into circles based on their relationship to the library; for example 'library staff' and patrons" or story time attendees. Similarly, librarians can also use Google+ Hangouts, a form of video conferencing to conduct reference interviews and one on one interactions with library patrons.

2. Brief Overview of Google

Recent studies highlight that libraries have embraced digital marketing channels due to technological advancements and changing user behaviour. A 2025 review of African university libraries shows that digital platforms, including web-based tools and mobile technologies, are now central to library promotion efforts (Ahmad et al, 2023). Google story started way back at Stanford University at 1995 by Larry Page and Sergey Brin, graduation school students as the assignment. They built a search engine named Backrub which is used to retrieve each and every link on the World Wide Web. They tried to give importance to each and every page within the internet. The name was renamed as Google with a mission to organise the world's information and make it universally accessible and useful. From last few years we are witnessing how Google has caught the attention of academic community along with Silicon Valley investors, Google product (2017).

In 1998, Sun Microsystems co-founder Andy Bechtolsheim invested on the search engine developed by Larry and Sergey for $100,000 and Google Inc. was officially born with clunky desktop computers, a ping pong table and bright blue carpet in a Garage. The first was started in 1998 with a Google logo in colourful colour. The first doodle was stick figure in the logo for Burning Man Festival in 1998 itself. Company expanded rapidly and moved to its current headquarters (Googleplex) in Mountain View, California very next year with the spirit of doing things differently. Emerging literature identifies Google Ads as a strategic tool for promoting library services. Studies indicate that targeted advertising improves awareness and accessibility of library resources, especially among remote users (Wahyuni et al, 2024).

Recent developments (2024–2026) emphasize the importance of search engine optimization (SEO) and the emerging concept of Generative Engine Optimization (GEO). GEO focuses on improving visibility in AI-driven search systems, which are rapidly expanding (Wang et al, 2025).

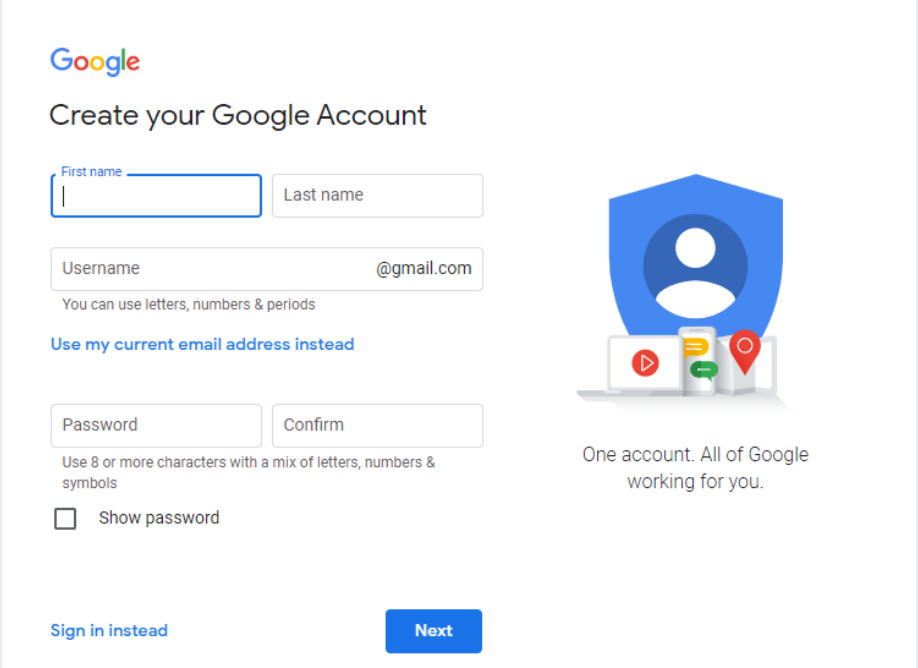
For libraries, this means:

- Optimizing metadata and digital repositories
- Enhancing discoverability of institutional resources
- Adapting to AI-powered search environments

3. Creating Google Account

Libraries have several options for establishing accounts. As mentioned above, there has to be a real person using her real or commonly accepted name already using Google. Per the Google Names Policy, "Pages require a personal profile to act as administrator of the page, though the administrator may remain anonymous to those interacting with the Google page" (Google 2011). Once one or more individuals have been designated to set up accounts, Google account can be created through the following steps:

1. Go to www.gmail.com
2. Click create account



3. Enter your name
4. In the "User name" field, enter a user name
5. Enter and confirm your password
6. Click next. Optional: Add and verify a phone number for your account.
7. You will receive a text message from Google with verification code
8. Enter your personal information such as name, date of birth, etc.
9. Click next.

3. Google Services

Google (2013) provides many web based services in search, advertising, developing categories. It can be classified as:

A. Net-based services

1. Search Tools: Google Search

Google Search is the main core product by Google which receives more than 3 billion queries per day and provides its service in 189 regional level domains.

Characteristics of Google search

i. It uses Hummingbird algorithm for query analysis. This helps to search related searches with respect to search term. Link analysis is done by Page rank link analysis algorithm. Google search uses Snapshot mechanism for indexing word documents, portable documents.

ii. Google came with new idea that an online author can have topical authority within Google Search Results by providing Google author ranking.

iii. Google Search includes Boolean logical operators, wildcards, and more, to help users refine their searches. Google search supports multiple language interfaces.

iv. Google Alerts provides email notification service, which sends alerts based on chosen search terms, whenever there are new results. Alerts include web results, Groups results news, and video.

v. Google's advanced search provides experimental Search options for testing new interfaces while searching with Google, including Timeline views and keyboard shortcuts.

vi. Google Custom Search allows the user to create his own customized search experience for his/her own website.

vii. Google Groups helps user to create like-minded groups on web and allow email discussion service and Usenet archive. Users can join a group, make a group, publish posts, track their favourite topics, write a set of group web pages updatable by members and share group files.

viii. Google Patent Search, an interface for millions of patents, each result with its own page, including drawings, claims and citations.

ix. Google Hotel Finder, Google Flight Search, Google Image search, Language Tools where it allows users to translate text or web pages from one language to another, and another that allows searching in webpages

located in a specific country or written in a specific language. Google News an automated news aggregator and compiler provide aggregated news for more than 20 languages.

x. Google Scholar search interface for the scholarly literature across an array of publishing formats and scholarly fields. The index includes virtually all peer-reviewed journals available online.

xi. Google Recipe View – lets you narrow your search results to show only recipes, and helps you choose the right recipe amongst the search results by showing clearly marked ratings, ingredients and pictures.

2. *Promotion Services*

AdMob, Google AdSense, Google display Planner, Google AdWords, Adwords Express , Google Certification Program , DoubleClick, Google Ad Grants, Google Think Insights are some advertising management and advertisement serving technology for business purposes.

3. *Publishing and Communication Tools*

i. Google Cultural Institute helps to explore collections from around the world. Google Art Projects, cultural collections and stories are presented in innovative way.

ii. Google Cloud Search is a smart search engine that allows G Suite business customer users to search across G Suite products, including Google Drive, Gmail, Sites, Google Calendar, Docs, Contacts and more.

iii. Google Classroom is a content management system for schools that aids in distribution and grading of assignments and providing in-class communication.

iv. Blogger/Weblog is weblog publishing tool by Google where users can create custom, hosted blogs with features such as photo publishing, comments, group blogs, blogger profiles and mobile-based posting with little technical knowledge.

v. Google Business Solutions is collection of services offered by Google specifically directed at web masters and businesses.

vi. Google Calendar is free online calendar, includes Gmail integration, calendar sharing, and a "quick add" function that allows inserting events using natural language input.

vii. Google Drive is an online backup service and storage space. This service is connected with Google Docs.

viii. Google Hangouts is an instant messaging and video chat platform by unified replacement for Google Talk, Google+ Messenger, and Hangouts, the video chat system present within Google+.

B. Development Tools

1. Security tools covers developer tools such as Google App Engine, Google Developers , Google's site for developers , Dart , Go (programming language),Open Social , Google Page Speed Tools, Google Swiffy Google Web Toolkit , Google Search Console ,Translator Toolkit, Security tools, re CAPTCHA are specially designed for web developers.
2. Map-related products are Google Maps, Google Street View, Google Street View Inside Trusted, Google My Maps, Google Maps Gallery, Google Mars, Google Sky, Google Transit etc.
3. Statistical products include Google Analytics, Google Consumer Surveys, Google Correlate, Freebase, Google Fusion Tables, Google Ngram Viewer, Google Public Data Explorer, TensorFlow, Trendalyzer, Google Trends, Zeitgeist, Google Activity Report

C. *Operating systems* include Android, Chrome OS, Android Wear, Android Auto, Google Glass OS etc.

D. *Desktop applications* Google provides many products for desktops including Google Chrome, Google Earth, Google Toolbar, Android Studio, Google Web Designer, Google Drive – Client software.

E. *Mobile applications* Most of the Google products are designed for mobile web applications and mobile standalone applications.

a. Google Apps for Enhancing Learning and Information Dissemination in Libraries

Easy use and financial factors might compel the libraries to use Google apps and try for the benefits for building a more collaborative learning environment. Acharya and Vagdal, (2023). argues that, these benefits potentially include peer review of academic work and the ability to observe and participate in the creation of scholarly material. Today's learners are generally comfortable sharing content and collectively generating knowledge. The Google Apps helps in communication and file storage provides a set of tools and an infrastructure to make this happen. By leveraging student interest in and use of such tools, libraries might be able to encourage more experimentation with collaborative learning. Google Apps also facilitates sharing of information and it offers an easy way to publish work. Google Apps allows learner to forget about the tools and focus on creative ways to use technology in their disciplines.

Similarly, contemporary research stresses that libraries must transit from input-based metrics (e.g., number of collections) to outcome-based metrics e.g., user engagement, search visibility (Chen, 2023). In this IT enabled competitive word libraries are the entry points for traditional as well as digital world. There is ample of opportunities

for librarians to enhance their service quality by applying technological implications. McIntosh (2013) noted that, Google provides more than 100 products which can be implied in library activities. The following table provides list of Google apps along with the application of same on libraries as put forward by Ingram, (2012).

Google App	**Usage in Libraries**
Get Answers for Queries	
Search	Google Search is boon to layman in this technological world. Google search provides instant answers on the web and on over phone. Libraries can provide customized Google search within library website. Instant queries can be handled using Google search. Google helps to keep track of important days/ special days so as to mark them in calendar of events of library.
Chrome	Google chrome is a web browser which appeals to many users with faster, safer and easier sophisticated technology.
Maps	Maps helps in GPS navigation, traffic alerts, traffic directions. The library can register for its location on Google Map so that novice user can easily find the direction. Navigation is eased using google maps
Translate	Google translate helps to Speak, scan, type or draw to translate in over 100 languages. Many libraries provide translation services in local and international languages by hiring experienced language translators. Google translate is a single interface which provide translation service in more than 100 languages without spending much money and time.
Audio visual	
YouTube YouTube appeals user to Discover, watch and share their favourite videos and music.	Libraries can use YouTube as promotional tool. Small videos on library orientation, book talks, promoting reading habits can be uploaded in YouTube and can make reflect them in library webpage. World's largest medical library, The National Library of Medicine has its own YouTube channel where it posts videos of database training, exhibitions, public service announcements, lectures and more. One can browse through keyword search or subscribe to the channel to receive regular updates on particular channel.
Play music	Google play music provides access to millions of songs on demand and are usually ad-free. This app can have relevance in music libraries.
Chromecast	App aids in streaming movies and music from phone to TV. It can be aid for media libraries.
Communication Tools	

Gmail	Separate Library Gmail account can be used for sending and receiving emails for communication. Correspondence with the vendors can be established by using Gmail. Book reminders can be sent through the mail. Photos, Videos, other official documents with digital signature can be communicated through gmail.
Google Allo	Instant smart messaging app that helps to make like minded readers group so that SDI and CAS services can be provided. This app provides google assistant for smart messaging. The app is secures messages by providing end to end encryption.
Google Duo	It is one to one video calling app designed with simple interface with high quality video and audio calling facilities. It can be used foe tele and video conferencing sessions.
Google+	Google plus is an interest based social networking site where the user can add students, build communities, can share their views using photos, music, videos, animations and text documents. Google + can be used as promoting tool.
Information Organization	
Google Photos	Google photos can be great stuff to organise photos of library activities, programs.
Contacts	Contacts help to organise users contact information.
Organize your schedules and share events	Google calendar organises libraries day to day activities. It is a collaboration tool where one can share your meetings with others and the fact that it syncs up all popular mobile platforms which in turn eases access. Google calendar can be used to organise calendar of events of libraries where special and important days can be added. The librarian can inform the student about schedule of library week, book exhibitions to be conducted through google calendar.
Keep	Keep app helps librarian to save the thoughts as notes, lists and voice memos. Keep helps in organising and keeping track of day to day library transactions, reminders, meeting schedules, voice notes etc.

For Online Smart work	
Slides	Portable stories with presentations can be created easily anywhere and can be carried everywhere by remembering just Google account mail id and password.
Drive	A safe place for all of library files. Google drive provides 15GB free storage where one can deposit all the documents, spread sheets, photos, scanned copies of documents on cloud and provides easy access. The Google drive can be linked with web pages, Google forms etc. Library professionals can deposit the syllabus copies, curriculum, notices, old question papers
Google Books	Google books helps librarian to go through rare titles, desired books required by the users on non-availability of physical books. Review option is book helps to know the quality, context of the book. It is very useful for techno-savvy librarians. This is one of the biggest projects that Google has ever undertaken and involves scanning as many books as Google can get their hands on and making them indexable in their search engines.
Google Forms	Google forms help to do a survey on various library issues such as collect feedback on library activities and services, receive book suggestions etc.
Google class room	A content Management module can help the users to attend scheduled information literacy programmes.
Google Sites	Allows to create libraries webpages easily and quickly without the knowledge of programming.
Google Scholar	A gateway for scholarly literature. Abstracting and Indexing services can be provided for users on request.
Google News	Google news works on aggregation algorithm which combines news from various news channels websites and aggregates many traditional media on daily basis. Helps in providing Current Awareness Service.

Recent research confirms that digital marketing—including analytics and targeted advertising—positively impacts:

- Library visibility
- User satisfaction
- Resource utilization

For example, social media and analytics-based campaigns have been shown to significantly increase engagement and awareness of library services (Tomar, 2024). Google-based advertising extends this impact by reaching users through search behaviour, making it more intent-driven and measurable.

4. Conclusion

Despite high adoption rates, the effectiveness of these strategies remains inconsistent due to lack of infrastructure, policy, and expertise. This underscores the need for analytics-driven approaches, such as those provided by Google tools, to evaluate outcomes. As mentioned, one of the significant weaknesses attached to using Google account is that, it requires all content, even content meant to represent institutions or businesses be tied to specific people. This introduces the opportunities for inadvertent cross-posting of content as well as significantly decreasing individual privacy by forcing the connection between an individual's personal and professional identities. However, with the aim of organising the world's information, and make it universally accessible and useful, Google is providing various services and products. Alexa, a company that monitors commercial web traffic, lists Google.com as the most visited website in the world. Several other Google services also figure in the top 100 most visited websites, including YouTube and Blogger. Google has been the second most valuable brand in the world for 4 consecutive years. So these powerful products/services by Google can be used in libraries for the benefit of users. Libraries can attract users in the virtual world by using Google apps for providing ready reference services to the users.

ADVOCACY AND MARKETING PRACTICES IN NATIONAL LIBRARY OF NIGERIA, KADUNA BRANCH

∗[1]Danjuma Mohammed and [1]Isreal Abimaje Ochai (abimajeisrael@gmail.com)

[1] Institute Library, Airforce institute of technology Kaduna, Nigeria.

∗Corresponding Author (mdanjuma36@gmail.com)

Abstract

The National Library of Nigeria, Kaduna State Branch, serves as an important information institution that supports education, research, literacy development, and access to knowledge resources. However, effective utilization of its services depends largely on advocacy and marketing activities that create awareness and attract users. This paper systematically reviews literature on advocacy and marketing practices in the National Library of Nigeria, Kaduna State Branch. The study examines the concepts of advocacy and marketing, identifies key advocacy and marketing strategies, explores their outcomes, and highlights challenges affecting implementation. Findings reveal that the library engages in reading promotion programmes, user education, stakeholder engagement, exhibitions, public relations, and digital communication strategies to enhance visibility and service utilization. The review further indicates that these practices lead to improved awareness, increased patronage, strengthened stakeholder relationships, and enhanced literacy promotion. However, challenges such as inadequate funding, poor ICT infrastructure, low public awareness, insufficient staff training, and limited government support hinder effective implementation. The study concludes that advocacy and marketing remain critical for improving the visibility and relevance of the National Library of Nigeria, Kaduna Branch. It recommends increased funding, digital transformation, staff capacity development, and stronger institutional collaboration to enhance service delivery.

Keywords: Advocacy, Marketing, National Library of Nigeria, Kaduna State Branch, Library Services.

INTRODUCTION

Libraries are essential institutions that support education, research, and national development through the provision of information resources and services. The National Library of Nigeria (NLN), as the apex library institution in the country, plays a central role in coordinating library development and ensuring access to information resources. The Kaduna Branch of the National Library of Nigeria serves as a regional extension that facilitates access to library services within the northern region. However, with the increasing dominance of digital information sources and alternative knowledge platforms, libraries face challenges in attracting and retaining users. This has made advocacy and marketing critical components of modern library practice. Advocacy and marketing are essential for increasing public awareness, attracting users, and securing institutional support. Therefore, understanding how these practices are implemented and the challenges involved is necessary for improving library service delivery.

OBJECTIVES OF THE STUDY

The main objective of this study is to systematically review advocacy and marketing practices in the National Library of Nigeria, Kaduna Branch.

The specific objectives are to:

1. Identify advocacy practices employed by the National Library of Nigeria, Kaduna Branch.
2. Examine marketing strategies adopted by the National Library of Nigeria, Kaduna Branch.
3. Determine the outcomes of advocacy and marketing practices on library service delivery.
4. Identify challenges affecting the effective implementation of advocacy and marketing practices.

CONCEPT OF ADVOCACY

Advocacy involves intentional actions directed at influencing decision-makers, stakeholders, and the public in support of a cause, program, or institution. In librarianship, advocacy refers to efforts aimed at promoting the value and importance of library services to governments, funding agencies, and users. Library advocacy activities include awareness campaigns, stakeholder engagement, community outreach, media engagement, and professional participation. The primary goal is to secure funding, recognition, and policy support for library development. Mngutyo et al. (2020) note that advocacy serves as an effective public relations strategy that highlights the contribution of libraries to education and societal development.

CONCEPT OF MARKETING

Marketing in librarianship involves identifying user needs and promoting services that satisfy those needs effectively. It focuses on creating awareness of library resources and encouraging their utilization. Library marketing includes advertising, exhibitions, public relations, social media engagement, user orientation, newsletters, and digital communication. Modern library marketing integrates digital technologies to enhance visibility and accessibility of information services.

THEORETICAL FRAMEWORK

This study is anchored on Relationship Marketing Theory developed by Berry (1983). The theory emphasizes the development and maintenance of long-term relationships between organizations and their stakeholders. In the context of libraries, advocacy and marketing activities aim to build sustainable relationships with users, government agencies, educational institutions, and community stakeholders. Effective relationship management enhances trust, service utilization, and institutional support.

METHODOLOGY

This study adopted a systematic literature review approach to examine advocacy and marketing practices in the National Library of Nigeria, Kaduna Branch. Literature published between 2020 and 2025 was retrieved from Google Scholar, African Journals Online (AJOL), institutional publications of the National Library of Nigeria, and peer-reviewed journals in Library and Information Science.

The inclusion criteria consisted of scholarly publications related to library advocacy and marketing within the Nigerian context, written in English and published between 2020 and 2025. Excluded were publications not relevant to the study objectives or outside the specified period. Data were analyzed thematically based on the study objectives to identify advocacy practices, marketing strategies, outcomes, and challenges.

LITERATURE REVIEW (2020–2025)

Mngutyo et al. (2020) examined advocacy and lobbying as public relations tools in Nigerian libraries and found that advocacy significantly improves awareness and stakeholder support.

The National Library of Nigeria Strategic Plan (2020–2024) emphasizes literacy promotion, digital transformation, stakeholder engagement, and improved access to information resources.

Idogbe and Philip (2020) highlighted libraries as critical institutions for sustainable national development through information access and literacy promotion.

Areo et al. (2023) reported that marketing improves awareness and utilization of library services, although inadequate funding remains a challenge.

Oguntoye et al. (2024) emphasized digital marketing strategies such as social media and user-centered approaches for enhancing library visibility.

Ifaka (2025) identified inadequate publicity as a major barrier to effective library service utilization in the National Library of Nigeria.

FINDINGS AND DISCUSSION

Advocacy Practices

The review shows that advocacy practices in the National Library of Nigeria, Kaduna Branch include reading promotion programmes, stakeholder engagement, public awareness campaigns, educational outreach, and professional participation. These practices enhance visibility and strengthen stakeholder support. Mngutyo et'al. (2020) confirm that advocacy improves awareness and institutional recognition of libraries.

Marketing Strategies

Marketing strategies include user orientation, social media engagement, exhibitions, public relations, promotion of information services, and community-based programmes.

These strategies enhance access and utilization of library services. This aligns with Areo et al. (2023), who found that marketing increases awareness and patronage of library services.

Outcomes of Advocacy and Marketing

The review indicates that advocacy and marketing lead to improved awareness, increased patronage, stronger stakeholder relationships, enhanced literacy promotion, and improved institutional visibility.

These outcomes demonstrate the importance of strategic communication in library service delivery.

Challenges

Key challenges include inadequate funding, poor ICT infrastructure, low public awareness, insufficient staff training, weak government support, poor internet connectivity, and competition from digital platforms.

These challenges limit effective implementation of advocacy and marketing initiatives in the library system.

RECOMMENDATIONS

1. Government should increase funding for advocacy and marketing programmes.
2. The library should strengthen digital marketing and social media engagement.
3. Staff should receive regular training in public relations and marketing.
4. Partnerships with schools, universities, and media organizations should be strengthened.
5. Community outreach programmes should be expanded.
6. Modern ICT infrastructure should be improved.
7. Continuous evaluation of marketing strategies should be conducted.

CONCLUSION

Advocacy and marketing are essential components of modern library administration. The National Library of Nigeria, Kaduna State Branch, employs various strategies to improve awareness, utilization, and stakeholder engagement. Despite existing challenges, these practices significantly enhance library visibility and relevance. Strengthening advocacy and marketing through funding, technology, and capacity building will further improve service delivery and support national development goals.

Abstract

The increasing complexity of organizational knowledge ecosystems in the digital era underscores the need for structured information systems that enhance decision-making, innovation, and competitiveness. However, corporate libraries remain underdeveloped in Nigeria, leading to fragmented knowledge systems, inefficient information use, and limited professional visibility for librarians. This study examines advocacy for functional corporate libraries in Nigeria and its implications for librarians' relevance in a knowledge-driven economy. Anchored on Diffusion of Innovation Theory, Knowledge Management Theory, and the Resource-Based View, corporate libraries are conceptualized as strategic knowledge assets that support organizational efficiency and competitive advantage. The study adopts a qualitative exploratory approach, drawing on documentary evidence and empirical insights from banking, oil and gas, government institutions, and emerging private knowledge service providers. Findings reveal persistent challenges, including low awareness, weak policy frameworks, inadequate technological integration, and marginal involvement of librarians in corporate decision-making. Evidence shows that while fragmented information services exist across sectors, they remain uncoordinated, underfunded, and underutilized. A key paradox is the preference for external knowledge investments through corporate social responsibility initiatives while neglecting internal corporate knowledge systems. The study proposes a multi-dimensional advocacy framework integrating policy reform, corporate engagement, professional capacity development, and artificial intelligence-driven knowledge systems. It concludes that repositioning librarians as strategic knowledge managers is essential for organizational performance, innovation, and knowledge retention, and that corporate libraries are critical to strengthening Nigeria's knowledge economy and aligning with global best practices.

Keywords: Advocacy, corporate libraries, librarianship, information services, Nigeria, qualitative study

Introduction

The library from inception always plays significant role in organizations' growth and development, serving as an information hub supporting the parent institution information needs in different paradigm. This is more than just stocking information resources but also to its usage, accessibility and impact measure on the organization. Every organization work and need information to survive. Their information needs are non-sacrosanct as it prepares, boost and support the organization operations. The concept of special library emanated from the emergence of the need to have specialized information for a particular group of individuals or profession to enable them solve a particular problem (Mundi, 2022). The cooperate also called special libraries include libraries in institutions such as financial institution, oil companies, research institutes and government agencies providing tailored information services to staff. These libraries are crucial for supporting corporate decision-making, research and employee training by offering specialized databases, reports and industry-specific journals/articles, contribute to the development and research efforts of the organization.

Corporate libraries have been playing significant roles in enhancing organizational performance through knowledge management and storage, strategic decision support, support for innovation and research. Technology innovation, human resource development. They optimize productivity by providing tailored digital resources, research and other information services. The corporate libraries are characterized with collections that is limited to one subject area and the users are limited to people who have a deep interest in certain subject. They provide information whether for immediate or future utilization which bring together users and information in various formats and are presented in the most effective medium to their users (Mommoh & Egbunu, 2019). These no doubt increasing their productivity when proper provided and managed. However, despite these enormous roles and significant; just as any other institutions in Nigeria, cooperate libraries operations have been hindered by several challenges. Mommoh and Emmanuel (2019) Danbaki, Gao and Ndams (2018), Madu and Chris-Israel (2019) inadequate funding, Emezie and Nwaohiri (2017) ICT tools and incorporations.

The corporate library just like any others in Nigeria is being engulfed with enormous challenges. Onwubiko (2020) states that despite all the importance of information management and provision in public institutions it is disheartening to state that it was observed that most of the expected roles of special libraries are not carried out as a result of identified challenges. The libraries are only seen as units of the institutions and not as information centres that can mastermind the

transformation of these institutions for effective and optimal service delivery to its user. To a larger extent too, the persistent weaknesses and limited effectiveness of the Nigeria Library Associations and bodies across several states further undermine the functionality of corporate libraries in Nigeria by weakening coordinated advocacy efforts and reducing the profession's capacity to mobilize funding and strategic support from philanthropists, development agencies, and other stakeholders.

It is therefore important for a strong advocacy for functional corporate libraries in Nigeria so as to serve as an essential repositioning centre for information resources and managers whose adequacy, efficiency, relevance and expertise enhances organizational decision-making, strengthens knowledge management systems of corporate libraries or information centres.

Research Objectives

The main objective of this study is to examine advocacy for functional corporate libraries in Nigeria and its implications for librarians' relevance and professional visibility in a knowledge-driven economy. Specifically, the study seeks to:

1. assess the current status and level of development of corporate libraries in selected Nigerian organizations, with a focus on banking, oil and gas, government-affiliated institutions, and emerging private knowledge service providers.
2. examine the awareness, perception, and understanding of corporate libraries among organizational stakeholders and information professionals in Nigeria, particularly regarding their strategic value in organizational knowledge management.
3. identify the key challenges hindering the establishment, functionality, and sustainability of corporate libraries in Nigeria, including policy, funding, technological, staffing, and institutional barriers.
4. analyze the extent to which librarians are integrated into corporate decision-making and knowledge management processes within Nigerian organizations and how this affects their professional visibility and relevance.
5. evaluate existing advocacy strategies and frameworks used in promoting library and information services in corporate environments, and determine their effectiveness in influencing organizational adoption.
6. examine the role of emerging technologies, particularly artificial intelligence and digital knowledge systems, in enhancing the functionality of corporate libraries in Nigeria.
7. propose a comprehensive advocacy framework for the establishment and strengthening of functional corporate libraries in Nigeria as strategic assets for organizational performance and national development.

Theoretical Framework

This study is anchored on a multi-theoretical foundation to provide a robust explanation of how corporate libraries can be adopted, institutionalized, and sustained within Nigerian organizations. The framework integrates Diffusion of Innovation Theory (DOI) as the anchor theory, supported by Knowledge Management Theory (KMT) and Resource-Based View (RBV) of the firm.

Diffusion of Innovation Theory, 1962 (Anchor Theory)

Originally proposed by Everett Rogers, Diffusion of Innovation Theory explains how new ideas, practices, or technologies spread within a social system over time. In the context of this study, the establishment of corporate libraries is conceptualized as an organizational innovation.

Digital Object Identifier identifies five key attributes that influence adoption:

- **Relative Advantage:** The perceived benefits of corporate libraries (e.g., improved decision-making, efficiency, and knowledge retention)
- **Compatibility:** Alignment with existing organizational culture and workflows
- **Complexity:** Ease of understanding and implementing library systems
- **Trialability:** Opportunity to pilot corporate library initiatives
- **Observability:** Visibility of outcomes and benefits to stakeholders

Knowledge Management Theory (Supporting Theory)

Knowledge Management Theory developed by several influential theorists and organizational experts throughout the 1970, 1980 and 1990s with early propounded such as Peter Drucker and Paul Strassmann in emphasizes the systematic creation, capture, storage, sharing, and utilization of organizational knowledge to achieve strategic objectives.

Corporate libraries function as central nodes in the knowledge management cycle, enabling:

- Knowledge acquisition through curated resources
- Knowledge storage via repositories and databases
- Knowledge dissemination through information services
- Knowledge application in decision-making and innovation

In Nigerian organizations, the absence of structured knowledge systems leads to:

- Knowledge loss
- Inefficiencies in information retrieval
- Reduced organizational learning

Thus, KMT provides the justification for positioning corporate libraries as critical infrastructure for knowledge optimization.

Resource-Based View (RBV) of the Firm

The Resource-Based View posits that organizations achieve competitive advantage through valuable, rare, inimitable, and non-substitutable resources.

In this context:

- Information and knowledge are **strategic assets**
- Corporate libraries serve as capability enablers that transform raw information into actionable intelligence
- Librarians act as knowledge intermediaries, enhancing the value of organizational resources

By adopting corporate libraries, firms can develop unique knowledge capabilities that are difficult for competitors to replicate, thereby strengthening their competitive position.

The integration of DOI, KMT, and RBV provides a comprehensive lens for this study:

i. **DOI** explains *how* corporate libraries can be adopted
ii. **KMT** explains *why* they are essential for organizational effectiveness
iii. **RBV** explains *how they create competitive advantage*

Together, these theories support the argument that corporate libraries are not merely support services but strategic organizational assets. This integrated framework also informs the proposed advocacy strategies by linking awareness, value creation, and competitive positioning.

Literature Review

The Need for Advocacy

Promoting corporate libraries is essential in their strong service provision and support to the organization. This has more attributed to public libraries but its high time the corporate libraries too key into it. As demand for information increases even in organization, same should be the needs for your library. According to Lucidea (2018) post, library marketing delivers four main benefits: increase value to organization, higher usage, educated users, changed perceptions. This helps to communicate library values more through strategic planning and gives room for broader windows for partnership and supports (Scott, 2017). Successful strategies on advocacy of library value to leadership, philanthropist, investor in library facilities, resources provide an enhanced opportunities for collaboration across the nation; linking strategic initiatives, innovation, scholarship, grants and supports for the library as a strategic resource worthy of investment and engagements in the 21st century.

Fiscal Note (2026); a global leader in AI-driven policy intelligence, delivering deep expertise in legislative tracking, regulatory analysis and stakeholder engagementhighlighted advocacy strategies best practices with a 13 advocacy strategies for running a successful campaign: determining a clear objective, do your research, focus on building relationships, drive change through social media, master email marketing, use digital tools, educate members on how to communicate with investors in the case of a library, develop a grass root strategy, use data to your advantage, make national issues a local one, choose which issues are most important, incorporate stories about policies impacts and know your audience.

Impact on Librarians' Relevance

Corporate functioning libraries can redefine the roles of librarians through shifting their focus from traditional custodian duties to a more digitally inclined or strategic technology-driven roles that act as catalysts for knowledge creation, innovation and competitive advantage. In this digital age, a functioning corporate library can redefine roles of librarians by opening for new avenues of virtual library and online collections, information literacy and digital skills initiatives, critical thinkers and discerning consumers of online content with users' access to extensive collections of books, journals, and multimedia resources from anywhere, at any time (Bhalani & Rajeshri, 2024).

Murari, & Verma (2018), highlighted key skills and competencies for librarian in the corporate settings just as any other modern library which include Professional skills (foundation of the profession, organization of recorded knowledge and information, references and user services, information resources, administration and management), Technical skills (email, internet, web and search strategies, computer hardware troubleshooting and networking, library automation, blog, social networking, RSS feeds and Soft skills (listening, communication, writing skill, public relation, interpersonal skills, customer service, leadership and teamwork, negotiating skills).

Nigerian Empirical Evidence of Librarians' Relevance and Professional Visibility in some selected Corporate Libraries

1. Banking Sector Knowledge Systems (Chartered Institute of Bankers of Nigeria – CIBN)

The Chartered Institute of Bankers of Nigeria (CIBN) represents one of the most structured examples of a corporate-style knowledge hub in Nigeria's financial sector. The institute maintains a specialized library that serves banking professionals, researchers, and policy actors within the financial ecosystem. Its core mandate includes supporting professional certification, continuous learning, and access to curated financial and economic literature, positioning it as a critical enabler of knowledge-driven banking practice in Nigeria (CIBN, 2023). Beyond its physical and digital collections, the CIBN library provides information brokerage services that support evidence-based decision-making within the banking profession. It facilitates access to regulatory publications, monetary policy documents, and financial research outputs that are essential for maintaining industry standards (Aina, 2020). In doing so, it functions as a semi-corporate knowledge infrastructure bridging academia, regulation, and practice.

However, despite its effectiveness, the CIBN model remains largely sector-specific and does not extend into private banking institutions as embedded corporate libraries. Most commercial banks in Nigeria still rely on fragmented digital subscriptions or informal knowledge-sharing systems, limiting consistency in knowledge accessibility across institutions (Nkanu & Okon, 2022). From an analytical standpoint, the CIBN case demonstrates that structured knowledge systems are feasible and impactful in Nigeria. However, its confinement to a professional body rather than widespread corporate adoption underscores the need for advocacy to scale such models across industries (IFLA, 2021).

2. Bank Libraries in Northern Nigeria (Kano and Kaduna Studies)

Empirical studies conducted in selected banking institutions in Kano and Kaduna reveal that some form of library or documentation unit exists within certain financial organizations. These units typically manage internal reports, regulatory documents, and customer service information, though they remain largely administrative rather than strategic in function (Nkanu & Okon, 2022). Despite their existence, these information units suffer from structural limitations such as inadequate funding, lack of professional staffing, and outdated collections. Most are not digitized and lack integration into broader organizational knowledge systems, reducing their effectiveness in supporting decision-making (Ajibade, 2021).

Another key issue is low utilization by staff. Employees often rely on informal networks or external online sources rather than internal repositories, reflecting a weak organizational knowledge culture (Oke & Fernandes, 2020). This undermines institutional learning and efficiency. Overall, these findings highlight a gap between the existence of library-like units and their functional relevance. While partial structures exist, they are not strategically embedded within corporate workflows, reinforcing the need for structured advocacy and institutional redesign (Taylor, 2021).

3. Oil and Gas Sector Knowledge Management Gaps

The oil and gas sector in Nigeria represents a highly knowledge-intensive industry requiring structured access to technical, regulatory, and operational data. However, studies show that most organizations in this sector lack centralized corporate library systems, resulting in fragmented information storage across departments (Olatokun & Ajagbe, 2021). This fragmentation leads to inefficiencies in document retrieval, compliance reporting, and technical documentation management. In high-risk and highly regulated industries, such inefficiencies significantly affect productivity and decision-making processes (World Bank, 2022). Although some organizations have adopted enterprise systems, these are not always structured as integrated knowledge management frameworks. The absence of information professionals in strategic roles further weakens organizational knowledge governance (Brown, 2023). This case demonstrates that even technologically advanced industries in Nigeria operate without structured corporate libraries, reinforcing the need for institutionalized knowledge systems as strategic assets rather than administrative tools.

4. Government-Affiliated Knowledge Systems (Centre for Management Development – CMD)

The Centre for Management Development (CMD) operates a hybrid knowledge system that supports both public and private sector capacity building. Its library provides access to management literature, policy documents, research outputs, and training materials, integrating knowledge services directly into governance processes (CMD, 2023). Unlike traditional libraries, CMD embeds information services within training and policy development functions, ensuring that knowledge is actively applied in institutional decision-making (UNESCO, 2023). This integration enhances organizational learning and cross-sectoral collaboration. However, CMD remains an exception within Nigeria's institutional landscape. Most organizations lack similar embedded systems, limiting their ability to leverage structured knowledge for development outcomes (IFLA, 2021). The CMD model demonstrates the potential of hybrid knowledge systems that combine library science with policy and management functions. It provides a scalable model for corporate library development in both public and private sectors.

5. Corporate Social Responsibility (CSR) Library Interventions

Corporate Social Responsibility initiatives by major Nigerian corporations, particularly in the oil and gas sector, have led to the establishment of community-based libraries. Companies such as Chevron and NNPC have funded libraries equipped with ICT infrastructure and digital learning resources (World Bank, 2022). These initiatives contribute positively to literacy development and digital inclusion in host communities. They also support educational access by providing infrastructure that is otherwise unavailable in underserved regions. However, these investments are externally focused and rarely integrated into internal corporate knowledge systems. This creates a disconnect between external

CSR initiatives and internal knowledge management needs (Aina, 2020). This pattern reflects a misalignment between corporate recognition of library value and internal implementation. It highlights the need for advocacy to shift from external CSR-driven library support toward embedded corporate knowledge systems.

6. **Emerging Private Knowledge Service Providers**

Nigeria has witnessed the emergence of private firms offering specialized knowledge and information services, including research consultancy, digital libraries, and data analytics platforms (Brown, 2023). These firms reflect growing demand for structured knowledge solutions in both public and private sectors. These providers offer services such as document management, digital archiving, and research support, filling gaps left by underdeveloped corporate libraries. Their growth indicates increasing awareness of the importance of structured information systems. However, most operate as external consultants rather than embedded organizational units. This limits their integration into daily corporate workflows and reduces long-term institutional knowledge building (Oke & Fernandes, 2020). Nonetheless, their emergence signals a growing knowledge economy in Nigeria and presents opportunities for hybrid corporate library models that integrate internal systems with external expertise.

Recommendations for Stakeholders

Based on the findings, theoretical grounding, and empirical evidence presented in this study, a multi-level set of recommendations is proposed to guide the successful advocacy, establishment, and institutionalization of corporate libraries in Nigeria.

1. National policy intervention and regulatory support.

First, there is a critical need for **national policy intervention and regulatory support.** Government agencies in charge of information management, education, and labour development should collaborate with professional bodies such as the Nigerian Library Association (NLA) to develop a clear national framework for corporate libraries. Such a policy should define minimum standards for corporate information services, outline the role of librarians in corporate environments, and provide incentives for organizations that establish structured knowledge systems. This will help formalize corporate libraries as recognized components of organizational infrastructure rather than optional services.

2. Corporate organizations should integrate libraries into their strategic management structures.

Second, **corporate organizations should integrate libraries into their strategic management structures.** Rather than treating information services as administrative support units, firms in banking, oil and gas, telecommunications, and manufacturing should establish internal corporate libraries or knowledge centres managed by qualified information professionals. These units should be embedded within decision-making processes to support research, innovation, compliance, and strategic planning. Organizations should also allocate dedicated budgets for staffing, digitization, and continuous upgrading of knowledge systems to ensure sustainability and relevance.

3. Library professionals must adopt proactive advocacy and repositioning strategies

Library professionals must adopt proactive advocacy and repositioning strategies to enhance their visibility in corporate environments. Librarians should move beyond traditional roles and actively demonstrate their value as knowledge strategists, data curators, and information analysts. Professional associations should intensify capacity-building programmes that equip librarians with skills in data analytics, artificial intelligence tools, digital knowledge management systems, and corporate communication. This will enable them to align more effectively with the evolving needs of modern organizations and strengthen their professional relevance outside academic settings.

4. Technology integration should be prioritized as a core driver of corporate library development.

Technology integration should be prioritized as a core driver of corporate library development. Nigerian organizations should leverage emerging technologies such as artificial intelligence, machine learning, cloud computing, and digital repositories to modernize knowledge management systems. AI-powered search tools, automated classification systems, and predictive analytics can significantly improve information retrieval, decision-making, and organizational learning. Partnerships with ICT firms and knowledge service providers should be encouraged to accelerate the development of scalable and efficient corporate library infrastructures.

5. Public-private partnerships (PPPs) should be established to support corporate library development and sustainability. Collaboration between government institutions, private corporations, and international development agencies such as UNESCO and IFLA can provide technical expertise, funding support, and global best practices. These partnerships can also facilitate pilot corporate library projects in key sectors such as banking, oil and gas, and telecommunications, which can later serve as scalable models for other industries.

Finally, **continuous research and monitoring should be encouraged to strengthen evidence-based implementation.** Academic institutions and LIS researchers should conduct longitudinal and sector-specific studies to assess the impact of corporate libraries on organizational performance, innovation, and productivity. Data-driven evaluations will provide empirical justification for policy expansion and institutional adoption. Furthermore, case documentation of successful corporate library models within Nigeria and comparable economies should be promoted to support knowledge sharing and best practice development.

Conclusion

This study set out to examine the role of advocacy in promoting the establishment of corporate libraries in Nigeria as strategic instruments for knowledge management and professional visibility of librarians. Drawing from theoretical perspectives such as Diffusion of Innovation Theory, Knowledge Management Theory, and the Resource-Based View, the study establishes that corporate libraries are not merely support structures but strategic knowledge assets capable of enhancing organizational efficiency, innovation, and competitiveness. The Nigerian evidence reviewed across banking, oil and gas, government institutions, and emerging private knowledge services demonstrates that while fragments of corporate library functions exist, they remain largely unstructured, underutilized, and insufficiently integrated into organizational strategy.

Empirical findings further reveal a consistent pattern of weak institutional awareness, limited policy support, and inadequate embedding of librarians within corporate decision-making processes. Even in sectors where information systems exist, such as banking and oil and gas, these systems are often administrative rather than strategic, resulting in fragmented knowledge flows and reduced organizational learning capacity. The study also highlights a significant paradox: while corporations invest in external knowledge infrastructures through CSR initiatives, they rarely internalize such systems to strengthen their own knowledge ecosystems. This disconnect underscores a missed opportunity for leveraging information as a core competitive resource.

The study therefore argues that the absence of corporate libraries in Nigerian organizations is not due to a lack of relevance, but rather a lack of structured advocacy, institutional policy frameworks, and technological integration. The integration of artificial intelligence, digital repositories, and modern knowledge management systems presents a transformative opportunity to reposition corporate libraries as dynamic, data-driven knowledge hubs. When properly implemented, these systems can enhance decision-making, support innovation, and improve organizational memory across sectors. In this regard, librarians must evolve from custodians of information to strategic knowledge managers who actively contribute to organizational intelligence and performance.

In conclusion, the establishment of corporate libraries in Nigeria is both a strategic necessity and an achievable reform within the evolving knowledge economy. However, this transformation requires deliberate advocacy at professional, institutional, and policy levels. Stakeholders including library associations, corporate leaders, and policymakers must collaborate to develop enabling frameworks that support the integration of corporate libraries into organizational structures. Ultimately, repositioning libraries within corporate environments will not only enhance organizational effectiveness but also elevate the professional identity of librarians as indispensable actors in Nigeria's knowledge-driven development agenda.

Abstract

This study examines students' attitudes toward declaring the use of generative artificial intelligence (GenAI) in academic writing within Nigerian library schools. A cross-sectional survey design was adopted, and data were collected through a structured questionnaire administered to 374 library and information science students across selected Nigerian universities. Descriptive statistics and non-parametric tests, including Mann–Whitney U, Kruskal–Wallis, and Spearman correlation, were used for data analysis. The findings reveal widespread use of GenAI tools, particularly conversational AI systems, for various academic writing tasks. However, students exhibited generally weak attitudes toward declaring AI use and demonstrated low and inconsistent levels of disclosure, often declaring only when explicitly required. Awareness of institutional policies was also limited, and no significant relationship was found between policy awareness and attitudes toward declaration. Key factors influencing disclosure included fear of academic penalties, lecturer expectations, unclear guidelines, and concerns about negative judgment. The study concludes that while GenAI tools are deeply integrated into students' academic writing practices, transparency in their use remains limited due to ambiguity, fear, and insufficient institutional guidance. It recommends that universities develop clear AI policies, integrate disclosure requirements into assessment practices, and provide structured training to promote ethical and transparent AI use.

Keywords: Generative AI, academic writing, AI declaration, student attitudes, academic integrity

Introduction

It is undeniable that Generative Artificial Intelligence (GenAI) tools have significantly changed how students approach academic tasks, particularly in higher education, where writing, research, and knowledge synthesis are central. Increasingly, students rely on GenAI tools to generate ideas, draft assignments, and enhance their learning processes. While these technologies offer substantial benefits in terms of efficiency and accessibility, they also introduce complex concerns related to academic integrity, transparency, and ethical scholarship. A critical issue that has recently gained attention is whether students are willing to declare their use of GenAI in academic work and how their attitudes shape such decisions. This issue is especially pertinent within library and information science education in Nigeria, where students are trained to uphold strong ethical standards in information use and dissemination.

Student attitudes toward GenAI use represent a key area in understanding their academic behavior. Attitudes encompass students' beliefs, perceptions, and predispositions toward a phenomenon, which in turn influence their actions and decision-making. Emerging evidence suggests that students often demonstrate mixed attitudes toward GenAI tools, simultaneously acknowledging their usefulness while expressing concerns about ethical implications and potential misuse (Adnan, 2025; Adžić et al., 2024). These ambivalent attitudes can influence how students perceive the necessity of declaring GenAI use. For instance, students who view GenAI as a legitimate academic aid may consider disclosure unnecessary, whereas those who perceive ethical risks may be more inclined to support transparency. Such variations highlight the importance of examining attitudes as a determinant of disclosure behavior.

Closely related to attitudes is the extent and nature of GenAI use among students. GenAI tools are utilized for a range of purposes, including brainstorming, summarizing, paraphrasing, and generating full academic responses. The diversity of these uses often creates uncertainty about what constitutes acceptable practice and when disclosure is required. Studies have shown that students frequently navigate a grey area between appropriate and inappropriate use of AI, which contributes to inconsistent practices and confusion regarding academic expectations (Farinosi & Melchior, 2025a; Nelson et al., 2025). When students perceive certain forms of GenAI use as minor or equivalent to traditional study aids, they may be less motivated to declare such use. This suggests that patterns of GenAI use are closely intertwined with attitudes toward disclosure, reinforcing the need to examine both variables together.

The act of declaring GenAI use is another major construct in this study, rooted in the broader framework of academic integrity. A declaration involves explicitly acknowledging the use of AI tools in the production of academic work, thereby promoting transparency and accountability. However, as GenAI technologies are relatively new, norms around disclosure are still evolving, and many students remain uncertain about expectations. Evidence indicates that non-compliance with AI disclosure requirements is becoming a concern in higher education, with some students deliberately withholding such information due to fear of penalties or negative judgment (Gonsalves, 2025). In other cases, students may fail to declare GenAI use simply because they are unaware of institutional requirements. These dynamics suggest that attitudes toward declaration are shaped not only by ethical considerations but also by perceived risks and institutional enforcement.

Awareness and knowledge of GenAI policies further influence how students approach disclosure. Students who are well-informed about institutional guidelines are more likely to develop positive attitudes toward transparency and

compliance. Conversely, limited awareness or unclear policies can foster indifference or resistance to declaring GenAI use. Research has demonstrated that students' awareness of AI tools and their ethical implications varies significantly across contexts, affecting how they interpret and respond to academic norms (Akça et al., 2025). This indicates that awareness functions as a mediating factor, shaping both attitudes and behaviors related to GenAI use and disclosure.

The context of Nigerian library schools adds a critical dimension to this discussion. Library and information science students are being prepared for professional roles that emphasize ethical information practices, intellectual honesty, and responsible knowledge management. Their attitudes toward GenAI use and disclosure are therefore not only relevant to their current academic practices but also to their future professional responsibilities. As the information landscape continues to evolve with the integration of AI technologies, these students are expected to model ethical engagement and guide others in responsible information use. Understanding their attitudes toward declaring GenAI use provides insight into how effectively current educational practices are fostering these competencies. This study, therefore, focuses on student attitudes toward declaring GenAI use in Nigerian library schools, examining how these attitudes are shaped by their use of GenAI, awareness of institutional policies, and perceptions of academic integrity. By linking these variables, the study provides a comprehensive understanding of the factors influencing disclosure behavior in the context of emerging AI technologies. Such insights are essential for developing clear policies, effective instructional strategies, and ethical guidelines that promote responsible and transparent use of GenAI in higher education.

Problem Statement

The increasing integration of Generative Artificial Intelligence (GenAI) tools into higher education has created new opportunities for learning, academic writing, and knowledge production. However, this adoption of GenAI has also introduced significant challenges related to academic integrity, transparency, and ethical scholarship. While institutions are beginning to develop policies that require students to declare their use of GenAI in academic work, compliance with such expectations remains uncertain. Existing evidence suggests that students' engagement with GenAI is widespread and often shaped by convenience, perceived usefulness, and academic pressures, yet their willingness to disclose such use is inconsistent and poorly understood (Farinosi & Melchior, 2025a; Nelson et al., 2025). The disconnect between use and disclosure raises critical concerns about the integrity of academic outputs and the effectiveness of emerging institutional guidelines.

A growing body of research has examined students' attitudes, awareness, and usage patterns of GenAI across different educational contexts. These studies consistently showed that students hold complex and sometimes conflicting perceptions of GenAI, recognizing its benefits for learning while expressing uncertainty about its ethical implications (Adnan, 2025; Adžić et al., 2024; Akça et al., 2025). In particular, students often operate within ambiguous boundaries regarding acceptable and unacceptable uses of AI, which can lead to inconsistent practices and varied interpretations of academic norms (Farinosi & Melchior, 2025b). Despite these insights, current scholarship has largely focused on general perceptions and usage behaviors, with limited attention to the specific issue of disclosure. As a result of this trend, there is insufficient empirical understanding of how students approach the declaration of GenAI use in academic writing, and what factors influence their decisions to comply or not comply with such expectations.

The issue of non-disclosure has already begun to attract concern within higher education, particularly as institutions seek to uphold academic integrity in the face of rapidly evolving technologies. Evidence indicates that some students intentionally avoid declaring their use of AI tools due to fear of academic penalties, perceived stigma, or uncertainty about institutional policies (Gonsalves, 2025). Others may fail to disclose simply because they lack awareness of the requirement or do not consider certain forms of AI assistance significant enough to warrant acknowledgment. These patterns suggest that non-compliance is not solely a matter of misconduct but is also influenced by attitudes, perceptions, and contextual factors. However, empirical studies that systematically examine these dynamics, particularly in relation to disclosure behavior, remain scarce.

More importantly, there is a notable paucity of research focusing on this issue within the context of library and information science education, especially in developing countries such as Nigeria. Library school students occupy a unique position as future information professionals who are expected to uphold and promote ethical information practices, including proper attribution, transparency, and responsible use of digital tools. Despite this, there is little to no empirical evidence examining how these students perceive and practice the declaration of GenAI use in their academic writing. Existing studies have not sufficiently addressed whether students in this discipline align their use of emerging technologies with the ethical standards embedded in their professional training. This represents a critical gap in the literature, as the attitudes and behaviors of these students have implications not only for their academic integrity but also for their future roles as custodians of information ethics. Given these gaps, there is a clear need for empirical research that specifically investigates student attitudes toward declaring GenAI use, with particular attention to library and information science students in Nigeria. This study responds to this need by examining how students perceive the requirement to declare GenAI use, the extent to which they comply with such expectations, and the factors that influence their behavior. By focusing on a population that is both academically and professionally oriented toward ethical information use, this research offers a novel contribution to the growing discourse on GenAI in higher education. It moves beyond general discussions of usage and perception to address the critical and underexplored issue of disclosure,

thereby providing evidence that can inform policy development, curriculum design, and the promotion of academic integrity in the age of artificial intelligence.

Objectives of the Study

The objectives of this study are:

1. To identify the types of Generative Artificial Intelligence tools used for academic writing by students in Nigerian library schools.
2. To examine the types of academic writing tasks undertaken using Generative Artificial Intelligence tools by students in Nigerian library schools.
3. To examine the attitudes of students in Nigerian library schools toward declaring the use of Generative Artificial Intelligence for academic writing.
4. To determine the extent to which students in Nigerian library schools declare their use of Generative Artificial Intelligence in academic work.
5. To assess the students' level of awareness of institutional policies on GenAI use in Nigerian library schools.
6. To identify the factors influencing students' decisions to declare or not declare the use of Generative Artificial Intelligence in academic writing.

Hypotheses

The following null hypotheses have been formulated and tested at 0.05 level of significance:

1. There is no significant difference between male and female students' in theirattitudes toward declaring GenAI use in Academic writing in Nigerian Library Schools
2. There is no significant difference in attitudes toward GenAI declaration across academic levels
3. There is no significant relationship between students' attitudes toward GenAI declaration and their awareness of institutional policies

Literature Review

Types of Generative Artificial Intelligence Tools Used by Students for Academic Writing

Empirical evidence indicates that students' use of Generative Artificial Intelligence (GenAI) tools for academic writing is neither uniform nor random, but shaped by perceived usefulness, ease of use, and task-specific needs. Across studies, tools such as ChatGPT and similar large language models dominate student engagement, particularly for functions such as summarisation, clarification, and content generation. The pattern of use suggests a functional orientation, where students selectively deploy GenAI tools to enhance efficiency in academic tasks rather than as a complete substitute for independent work (Farinosi & Melchior, 2025a; Alsaeed et al., 2025). This selective engagement aligns with technology acceptance frameworks, where perceived usefulness and ease of use consistently predict adoption (Adnan, 2025; Sallam et al., 2024).

However, the nature of GenAI use extends beyond mere task execution to include cognitive augmentation. Students increasingly rely on these tools for brainstorming, structuring arguments, and refining written output, indicating a shift from traditional support tools to co-creative systems (Alsaeed et al., 2025). This aligns with findings that GenAI tools are evaluated based on their ability to support specific academic goals, suggesting that tool selection is context-dependent rather than generalized (Heil et al., 2025). At the same time, variations in usage patterns reflect differences in digital and AI literacy levels, with distinct user profiles ranging from novice to enthusiastic adopters (Beckman et al., 2025). These differences highlight that engagement with GenAI tools is mediated by prior experience and competence, rather than mere availability.

Despite widespread use, there is a consistent tension between utility and risk. Students acknowledge the efficiency gains associated with GenAI while expressing concerns about over-reliance, reduced critical thinking, and ethical implications (Adnan, 2025; Aksoy & Kursun, 2024). This duality suggests that GenAI tools are embedded within a broader negotiation between academic enhancement and integrity preservation. Importantly, usage is also influenced by behavioural and cognitive factors, including perceived risks, anxiety, and social influence, reinforcing the idea that technological adoption is socially constructed rather than purely individual (Sallam et al., 2024). Overall, the literature converges on the view that students' use of GenAI tools for academic writing is strategic, differentiated, and shaped by both technological affordances and contextual constraints.

Extent to Which Students Declare Their Use of Generative Artificial Intelligence in Academic Work

The extent to which students declare their use of GenAI in academic work remains inconsistent and context-dependent, reflecting a gap between actual usage and transparent reporting. While GenAI use is increasingly normalized, disclosure practices lag, often influenced by ethical ambiguity and perceived risks. Empirical findings suggest that students engage in both partial and non-disclosure, with some selectively acknowledging use only when it is substantial or explicitly required (Qu et al., 2025). The extent of declaration is further complicated by students' perceptions of academic integrity and detection mechanisms. While some students recognize non-disclosure as dishonest, others differentiate between types of AI use, considering certain forms (e.g., minor editing) as not warranting disclosure (Nelson et al., 2025). This selective ethical reasoning contributes to inconsistent declaration practices. Moreover, psychological mechanisms such

as the "AI ghostwriter effect," where responsibility for authorship is externalized, reduce the likelihood of disclosure by distancing students from the output (Qu et al., 2025).

The literature also suggests that ethical intention plays a significant role in determining compliance with disclosure norms. Students who demonstrate stronger ethical commitment are more likely to align their behaviour with institutional expectations, whereas weaker ethical orientation correlates with lower disclosure rates (Fang & Cai, 2025). Nevertheless, the moderate importance attached to ethical considerations among students indicates that ethical awareness alone may not translate into consistent declaration behaviour (Tsaryk & Frick, 2025). Taken together, these findings suggest that the extent of GenAI disclosure is shaped by a complex interplay of ethical judgment, perceived consequences, and cognitive framing, resulting in varied and often inconsistent practices.

Awareness of Institutional Policies on Generative Artificial Intelligence Use Among Students

Students' awareness of institutional policies on GenAI use appears to be uneven and often limited, which significantly affects their compliance and ethical decision-making. While general awareness of AI technologies is relatively high among students, this does not necessarily translate into a clear understanding of institutional guidelines governing their use (Akça et al., 2025). This disconnect between awareness and comprehension suggests that familiarity with AI tools does not equate to policy literacy. Studies indicate that institutional communication and training play a critical role in shaping awareness levels. Where institutions provide structured guidance and ethical frameworks, students demonstrate better understanding of acceptable practices and are more inclined to engage responsibly (Adnan, 2025; Alsaeed et al., 2025). Conversely, ambiguous or poorly communicated policies contribute to confusion and inconsistent behaviour, reinforcing the need for clarity and accessibility in policy design. The call for culturally sensitive and comprehensive frameworks further implies that awareness is not merely informational but also contextual (Adnan, 2025).

Some studies have also indicated that awareness is also influenced by individual and experiential factors. Students with prior exposure to AI technologies or formal training exhibit higher levels of understanding, suggesting that awareness is cumulative and experience-driven (Ayyoub et al., 2025). However, the persistence of basic-level knowledge among many students indicates that current educational interventions may be insufficient in developing deep policy awareness (Akça et al., 2025). Additionally, institutional culture and norms play a significant role in shaping how students perceive and internalize ethical expectations, often more than demographic factors (Tsaryk & Frick, 2025). Overall, the literature suggests that awareness of GenAI policies is fragmented and contingent on both institutional efforts and individual competencies.

Factors Influencing Students' Decisions to Declare or Not Declare the Use of Generative Artificial Intelligence in Academic Writing

Students' decisions to declare or not declare GenAI use are influenced by a multifaceted set of factors that extend beyond simple awareness or ethical considerations. One of the most prominent influences is the perceived risk of academic consequences. Fear of penalties, coupled with uncertainty about enforcement, often discourages disclosure, particularly when policies are ambiguous or inconsistently applied (Gonsalves, 2025). This indicates that institutional context significantly shapes behavioural outcomes. Social and psychological factors also play a critical role. Peer influence and subjective norms can either encourage or discourage disclosure, depending on prevailing practices within student communities (Gonsalves, 2025; Hsiao & Tang, 2025). At the same time, individual cognitive processes, such as perceived usefulness and enjoyment of GenAI tools, indirectly influence disclosure decisions by shaping overall engagement with the technology (Hsiao & Tang, 2025). The interplay between technological and social factors highlights the complexity of decision-making in this context.

Ethical orientation and personal responsibility further contribute to disclosure behaviour. While many students express a desire to act responsibly, their ethical concerns are often outweighed by practical considerations such as efficiency and performance outcomes (Kahl, 2025; Nelson et al., 2025). The tendency to undervalue ethical implications, as observed in comparative studies with instructors, suggests a gap between ethical ideals and actual practice (Tsaryk & Frick, 2025). Additionally, externalization of authorship through AI tools reduces perceived responsibility, thereby lowering the likelihood of disclosure (Qu et al., 2025). In addition, technological experience and competence also shape disclosure decisions. Students with greater familiarity and confidence in using GenAI tools are more likely to integrate them into their academic work, which may either increase or decrease disclosure depending on their ethical orientation (Adžić et al., 2024; Singh & Paiva, 2025). Furthermore, broader concerns about academic integrity, including issues of plagiarism, bias, and misinformation, contribute to the complexity of decision-making (Aksoy & Kursun, 2024). Generally, the literature indicates that disclosure behaviour is the outcome of interacting institutional, social, ethical, and technological factors, making it a highly contextual and dynamic process.

Theoretical Framing

The Unified Theory of Acceptance and Use of Technology (UTAUT) was developed by Viswanath Venkatesh and colleagues in 2003 as a comprehensive model for explaining user acceptance and usage behaviour of information systems (Venkatesh et al., 2003). The theory synthesizes elements from earlier models such as the Technology Acceptance Model, Theory of Planned Behaviour, and Diffusion of Innovation, thereby providing a unified perspective on technology adoption. UTAUT was designed to explain users' behavioural intention to use a technology and

subsequent actual usage behaviour, particularly in organizational and educational contexts. Importantly, UTAUT is built on four key constructs, including performance expectancy, effort expectancy, social influence, and facilitating conditions. Performance expectancy refers to the degree to which an individual believes that using a technology will enhance performance or productivity. Effort expectancy captures the perceived ease associated with the use of the technology. Social influence reflects the extent to which individuals perceive that important others believe they should use the technology. Facilitating conditions refer to the degree to which an individual believes that organizational and technical infrastructure exists to support the use of the technology. These constructs are further moderated by factors such as gender, age, experience, and voluntariness of use, which shape adoption behaviour in different contexts.

The applicability of UTAUT has been widely demonstrated in library and information science research, particularly in studies examining the adoption of digital technologies and electronic services (Awwad & Al-Majali, 2015; Parhamnia, 2022; Mensah & Onyancha, 2021; Yoon, 2016). Collectively, these studies demonstrate the robustness of UTAUT in explaining technology-related behaviours in academic and library environments. The relevance of UTAUT to the present study lies in its ability to explain students' engagement with Generative Artificial Intelligence (GenAI) tools and their subsequent behavioural decisions, including the declaration of such use in academic writing. Students' use of GenAI tools can be understood through performance expectancy, as many perceive these tools to enhance efficiency and academic output. Effort expectancy is also evident, as the ease of interacting with GenAI platforms encourages widespread adoption. Social influence plays a role in shaping students' attitudes and behaviours, particularly as peer practices and lecturer expectations influence decisions regarding disclosure. Facilitating conditions, including institutional policies, guidelines, and training, are critical in determining whether students are aware of and comply with expectations for declaring GenAI use.

Furthermore, UTAUT provides a useful lens for interpreting the gap between GenAI use and its declaration. While the theory primarily explains technology adoption, its constructs can be extended to understand compliance behaviour. For example, unclear facilitating conditions, such as ambiguous institutional policies, may hinder proper disclosure. Similarly, social influence may either promote or discourage declaration depending on prevailing norms among students. The interplay of these factors helps to explain why students may adopt GenAI tools readily but remain inconsistent in declaring their use. By applying UTAUT, this study is able to move beyond descriptive analysis and offer a theoretically grounded explanation of students' attitudes toward declaring GenAI use, thereby contributing to both theory and practice in the evolving landscape of AI in higher education.

Methodology

Research Design

This study adopted a cross-sectional survey design. A cross-sectional approach is appropriate for examining prevailing behaviours, perceptions, and practices within a defined population at a specific point in time (Creswell & Creswell, 2017; Setia, 2016). The design was considered suitable because the study sought to examine students' attitudes toward declaring the use of Generative Artificial Intelligence (GenAI), their level of awareness of institutional policies, extent of declaration, and the factors influencing such behaviour within Nigerian library schools during a defined period.

Population and Study Area

The population of the study comprised undergraduate students enrolled in Library and Information Science (LIS) programmes in selected Nigerian universities. To ensure national representation across the six geopolitical zones of Nigeria, six universities offering LIS programmes were purposively selected. These include the University of Abuja, FCT (North Central), Federal University Oye, Ekiti State (South West), Federal University of Technology, Ikot Abasi, Akwa Ibom State (South South), Enugu State University of Science and Technology, Agbani (South East), Ahmadu Bello University (North West), and the University of Maiduguri, Borno State (North East). The inclusion of institutions across all geopolitical zones enhanced geographical representativeness and minimized regional bias in the responses.

Sampling Technique and Sample Size

A convenience sampling technique was employed for this study. The questionnaire was administered online through academic colleagues in the selected universities who facilitated its distribution to LIS students. This approach enabled the researchers to reach willing participants efficiently within a limited timeframe, as supported by similar survey-based studies (Alam et al., 2024; Etikan et al., 2016; Saha & Roknuzzaman, 2024; Zulfiqar & Khalid, 2024). Although convenience sampling improved accessibility and response rate, it did not guarantee proportional representation of all subgroups within the population. At the end of the data collection process, a total of 374 valid responses were obtained and used for analysis. The sample size was considered adequate for both descriptive and inferential statistical analysis.

Instrument for Data Collection

Data were collected using a structured questionnaire developed in line with the objectives of the study and existing literature on GenAI use in academic writing. The questionnaire consisted of six sections:

- **Section 1:** Demographic information of respondents (such as gender, age, academic level, awareness of generative AI, and engagement with academic writing).
- **Section 2:** Types of academic writing tasks undertaken by students.

- **Section 3:** Students' attitudes toward declaring the use of GenAI in academic writing.
- **Section 4:** Extent to which students declare their use of GenAI in academic work.
- **Section 5:** Students' level of awareness of institutional policies on GenAI use.
- **Section 6:** Factors influencing students' decisions to declare or not declare GenAI use.

Sections 2 to 6 were structured on a four-point Likert scale, and response options ranged from Strongly Agree (4) to Strongly Disagree (1). A four-point scale was adopted to eliminate a neutral midpoint and encourage respondents to take a definite position, thereby improving clarity and interpretability of responses (Asún et al., 2016; Ayanbode & Adetoro, 2021). A decision benchmark of 2.50 was used for interpretation. Mean scores above 2.50 indicated agreement, while mean scores below 2.50 indicated low levels. The absence of a neutral option enhanced decisiveness and strengthened data interpretation (Asún et al., 2016; Pornel & Saldaña, 2013; Ayanbode & Adetoro, 2021; Idhalama et al., 2021; Labrague et al., 2020; Oladokun et al., 2025).

Validity and Reliability of the Instrument

Content validity of the instrument was ensured through expert review. The questionnaire was assessed by five experts in Library and Information Science who examined the items for clarity, relevance, and alignment with the study objectives. Their suggestions informed the refinement of the instrument. A pilot study was conducted using 30 LIS students from a university not included in the main study. Data obtained from the pilot test were analysed using Cronbach's alpha to determine the internal consistency of the instrument. The reliability coefficients for the major constructs ranged from 0.72 to 0.81, exceeding the recommended threshold of 0.70 for acceptable reliability (Hussey et al., 2025; Taber, 2018). This confirmed that the instrument was reliable for the main study.

Procedure for Data Collection

Data collection was conducted between December 2025 and February, 2026 using Google Forms. The survey link was distributed through academic colleagues in the participating universities via WhatsApp and email, who further shared it with LIS students. Follow up messages and reminders were periodically sent to enhance participation, a strategy known to improve response rates in online surveys (Dillman et al., 2014). Participation in the study was voluntary. An introductory section of the questionnaire informed respondents about the purpose of the study, assured them of confidentiality, and emphasized their right to withdraw at any stage without penalty. No personally identifiable information was collected from participants.

Method of Data Analysis

Data were analysed using both descriptive and inferential statistics. Descriptive statistics, including frequencies, percentages, mean scores, and standard deviations, were used to summarise respondents' demographic characteristics and address the research objectives. Mean scores were interpreted using a four-point Likert scale with a decision benchmark of 2.50. For hypothesis testing, non-parametric statistical techniques were employed due to the nature of the Likert-scale data. The Mann–Whitney U test was used to examine differences between two independent groups (gender), while the Kruskal–Wallis H test was applied to assess differences across multiple groups (academic levels). In addition, the Spearman rank-order correlation was used to determine the relationship between key variables, particularly students' attitudes toward GenAI declaration and their awareness of institutional policies. All analyses were conducted using SPSS, with the level of significance set at 0.05 (Pallant, 2020).

Results

Table 1: Demographic information of respondents (N=374)

Variable	Category	Frequency (n)	Percentage (%)
Gender	Male	132	35.3
	Female	232	62.0
	Prefer not to say	10	2.7
Age Range	18-20	168	44.9
	21-23	124	33.2
	24-26	52	13.9
	27 and above	30	8.0
Academic Level	100 Level	48	12.8
	200 Level	86	23.0
	300 Level	156	41.7
	400 Level	84	22.5
Awareness of Generative AI	Yes	374	100
	No	0	0

Engagement in academic writing	Yes	374	100
	No	0	0

Table 1 shows the demographic distribution of the respondents. The data indicate that the majority of participants were female (62.0%), followed by males (35.3%), while a small proportion (2.7%) preferred not to disclose their gender. In terms of age, most respondents were between 18–20 years (44.9%), followed by 21–23 years (33.2%), suggesting that the sample is largely composed of younger undergraduates. Regarding academic level, the highest proportion of respondents were in 300 level (41.7%), followed by 400 level (22.5%), 200 level (23.0%), and 100 level (12.8%), indicating stronger representation from mid- to final-year students. Notably, all respondents (100%) reported awareness of generative AI and engagement in academic writing, confirming that the sample is fully relevant to the study context.

Table 2: Types of Generative Artificial Intelligence tools used by students in Nigerian library schools for academic writing

S/N	Tool	SA	A	D	SD	Mean	SD
1	ChatGPT	210	120	30	14	3.40	0.78
2	Gemini	180	130	44	20	3.26	0.84
3	DeepSeek	172	138	44	20	3.24	0.83
4	Claude	168	140	46	20	3.22	0.82
5	DALL-E	160	138	50	26	3.16	0.87
6	Meta AI	120	150	70	34	2.95	0.92
7	Copilot	130	140	70	34	2.98	0.91
8	Grammarly	140	160	50	24	3.11	0.85

12	Connected Papers	110	150	80	34	2.89	0.93
13	Consensus AI	108	152	80	34	2.88	0.93
14	QuillBot	140	150	60	24	3.08	0.86

Table 2 presents the types of generative AI tools used by students for academic writing. The results reveal a generally high level of usage across all listed tools, as all mean scores exceed the benchmark of 2.50. ChatGPT recorded the highest mean score (3.40), indicating it is the most widely used tool among students. This is followed closely by Gemini (3.26), DeepSeek (3.24), and Claude (3.22), reflecting strong engagement with large language models. Tools such as DALL-E (3.16), Grammarly (3.11), Turnitin (3.09), and QuillBot (3.08) also show substantial usage, suggesting that students employ both content generation and writing support tools. Meanwhile, platforms like Semantic Scholar (2.95), SciSpace (2.94), Connected Papers (2.89), and Consensus AI (2.88) recorded comparatively lower but still significant usage. Overall, the findings indicate that students utilize a wide range of AI tools, with a stronger preference for conversational and generative systems.

Table 3: Types of Academic Writing Tasks Undertaken by Students

S/N	Item Statement	SA	A	D	SD	Mean	SD
1.	I frequently write course assignments as part of my academic work.	220	120	24	10	3.47	0.70
2.	I engage in term paper writing in my programme.	200	130	30	14	3.38	0.76
3.	I write seminar papers as part of my coursework.	190	130	40	14	3.33	0.79
4.	I participate in report writing (fieldwork, SIWES, or practicum reports).	180	140	40	14	3.30	0.80
5.	I engage in research proposal writing.	150	140	60	24	3.11	0.86
6.	I engage in article or manuscript writing for publication.	120	140	80	34	2.92	0.91

Table 3 highlights the types of academic writing tasks undertaken by students. The findings show that students are actively engaged in various academic writing activities, with all items recording mean scores above 2.50. Course assignments have the highest mean (3.47), indicating they are the most common writing task. This is followed by term papers (3.38), seminar papers (3.33), and report writing (3.30), suggesting consistent engagement in structured academic

tasks. Research proposal writing (3.11) and manuscript writing for publication (2.92) also show moderate participation, though comparatively lower. These results suggest that while students are highly involved in routine academic writing, engagement in advanced scholarly writing such as publication is less frequent.

Table 4: Attitudes Toward Declaring GenAI Use in Academic Writing

S/N	Item Statement	SA	A	D	SD	Mean	SD
1.	Declaring the use of GenAI in academic writing is necessary.	60	90	140	84	2.33	0.95
2.	I believe that using GenAI without declaration is academically inappropriate.	70	90	130	84	2.39	0.97
3.	I feel comfortable disclosing my use of GenAI tools in assignments.	50	80	150	94	2.23	0.96
4.	Declaring GenAI use promotes academic integrity.	70	100	120	84	2.42	0.97
5.	I consider GenAI use similar to other academic aids that should be acknowledged.	80	90	120	84	2.45	0.99
6.	I think declaring GenAI use may negatively affect how my work is evaluated.	160	120	60	34	3.08	0.91
7.	I believe students should always disclose any assistance received from GenAI tools.	70	100	120	84	2.42	0.97
8.	I feel that declaring GenAI use is unnecessary for minor assistance (e.g., grammar correction).	150	130	60	34	3.05	0.92
9.	I am willing to declare my use of GenAI if required by my institution.	120	130	80	44	2.87	0.94
10.	I believe that failure to declare GenAI use constitutes academic dishonesty.	70	100	120	84	2.42	0.97

Table 4 examines students' attitudes toward declaring GenAI use in academic writing. The findings indicate generally negative or weak attitudes toward declaration, as most mean scores fall below the 2.50 benchmark. Students do not strongly agree that declaring GenAI use is necessary (2.33) or that non-declaration is academically inappropriate (2.39). Similarly, they show low comfort in disclosing usage (2.23) and only moderate agreement that declaration promotes academic integrity (2.42). However, students strongly agree that declaring GenAI use may negatively affect evaluation (3.08) and that declaration is unnecessary for minor assistance (3.05). Despite this, there is moderate willingness to declare usage if required by the institution (2.87). Overall, the results suggest that students are hesitant about disclosure, largely influenced by fear of negative academic consequences and perceptions that minor AI use does not require acknowledgment.

Table 5: Extent of Declaration of GenAI Use

S/N	Item Statement	SA	A	D	SD	Mean	SD
1.	I declare my use of GenAI tools in my academic assignments.	40	80	160	94	2.18	0.93
2.	I acknowledge GenAI use when it contributes significantly to my work.	50	80	150	94	2.23	0.95
3.	I include statements indicating GenAI use in my submitted assignments.	40	70	170	94	2.15	0.93
4.	I cite or reference GenAI tools when I use them.	50	80	150	94	2.23	0.95
5.	I declare GenAI use only when explicitly required by my lecturer.	150	120	70	34	3.03	0.92
6.	I avoid declaring my use of GenAI tools in academic work.	160	130	60	24	3.14	0.88
7.	I disclose GenAI use in research-related writing (e.g., proposals, projects).	50	80	150	94	2.23	0.95
8.	I provide detailed explanations of how GenAI was used in my work.	30	70	170	104	2.07	0.92

9.	I declare GenAI use in both minor and major academic tasks.	40	80	160	94	2.18	0.93
10.	I consistently follow any available guidelines when declaring GenAI use.	50	80	150	94	2.23	0.95

Table 5 presents the extent to which students declare their use of GenAI tools. The findings indicate a generally low level of declaration, as most mean scores are below 2.50. Students report low levels of declaring AI use in assignments (2.18), acknowledging significant contributions (2.23), including statements (2.15), citing tools (2.23), and providing detailed explanations (2.07). However, students tend to declare AI use when explicitly required by lecturers (3.03), and many admit to avoiding disclosure (3.14). These results reveal a pattern of conditional and inconsistent disclosure, where students are more likely to comply only when compelled by external requirements rather than internal ethical motivation.

Table 6: Awareness of Institutional Policies on GenAI Use

S/N	Item Statement	SA	A	D	SD	Mean	SD
1.	I am aware that my institution has policies on the use of GenAI in academic work.	60	80	150	84	2.31	0.96
2.	I understand the guidelines for declaring GenAI use in my institution.	50	80	160	84	2.25	0.95
3.	My lecturers have informed me about GenAI use policies.	200	120	34	20	3.33	0.80
4.	I have received formal instruction on ethical use of GenAI tools.	60	80	150	84	2.31	0.96
5.	I know the consequences of not declaring GenAI use.	70	80	140	84	2.36	0.97
6.	Institutional policies on GenAI use are clearly communicated to students.	60	80	150	84	2.31	0.96
7.	I have accessed official documents outlining GenAI use policies.	50	80	160	84	2.25	0.95
8.	I understand what constitutes acceptable and unacceptable GenAI use.	60	80	150	84	2.31	0.96
9.	My institution provides training on responsible GenAI use.	50	80	160	84	2.25	0.95
10.	I am confident in my knowledge of GenAI-related academic regulations.	60	80	150	84	2.31	0.96

Table 6 shows students' awareness of institutional policies on GenAI use. The results indicate generally low awareness, with most items scoring below 2.50. Students report limited awareness of institutional policies (2.31), poor understanding of guidelines (2.25), lack of formal instruction (2.31), and minimal access to official documents (2.25). However, one notable exception is that lecturers have informed students about GenAI policies (3.33), suggesting that awareness is often transmitted informally rather than through structured institutional frameworks. Overall, the findings indicate that while students are somewhat exposed to policy information, their depth of understanding and confidence in policy knowledge remain limited.

Table 7: Factors Influencing Declaration of GenAI Use

S/N	Item Statement	SA	A	D	SD	Mean	SD
1.	Fear of academic penalties influences my decision to declare GenAI use.	120	100	100	54	2.76	0.96
2.	Lecturer expectations affect whether I disclose GenAI use.	110	110	100	54	2.74	0.96
3.	Institutional policies influence my decision to declare GenAI use.	80	90	130	74	2.47	0.97
4.	My personal sense of academic integrity influences my disclosure behavior.	90	90	120	74	2.52	0.98
5.	Peer practices influence whether I declare GenAI use.	80	100	120	74	2.49	0.97
6.	The perceived importance of the assignment affects my decision to declare GenAI use.	90	100	120	64	2.57	0.96
7.	My level of understanding of GenAI tools affects my disclosure decisions.	90	100	120	64	2.57	0.96

8.	The absence of clear guidelines discourages me from declaring GenAI use.	110	110	100	54	2.74	0.96
9.	Concerns about being judged discourage me from disclosing GenAI use.	100	110	110	54	2.68	0.97
10.	Ease of using GenAI tools influences whether I declare their use.	90	110	120	54	2.63	0.96

Table 7 identifies factors influencing students' decisions to declare or not declare GenAI use. The results show that several factors moderately influence disclosure decisions, as most mean scores are slightly above 2.50. Fear of academic penalties (2.76), lecturer expectations (2.74), absence of clear guidelines (2.74), and concerns about being judged (2.68) are key influencing factors. Additionally, perceived importance of assignments (2.57), understanding of GenAI tools (2.57), and ease of use (2.63) also play roles. However, institutional policies (2.47) and peer practices (2.49) fall slightly below the benchmark, indicating weaker influence. Overall, the findings suggest that psychological and contextual factors, particularly fear and ambiguity, are stronger determinants of disclosure behavior than formal institutional structures.

Hypotheses Testing

Hypothesis 1: There is no significant difference in students' attitudes toward declaring GenAI use based on gender.

Table 8: Results of Mann–Whitney U Test Examining Gender Differences in Students' Attitudes Toward Declaring Generative AI Use

Variable	Gender	N	Mean Rank	Sum of Ranks	U	Z	p-value
Attitude toward GenAI Declaration	Male	132	184.62	24,359.84	8,365.50	-0.91	0.363
	Female	232	189.77	44,020.64			

Table 8 presents the results of the Mann–Whitney U test examining gender differences in students' attitudes toward declaring GenAI use. The findings show no statistically significant difference between male and female students ($U = 8365.50$, $Z = -0.91$, $p = 0.363$). Since the p-value is greater than 0.05, the null hypothesis is retained. This indicates that gender does not significantly influence students' attitudes toward GenAI declaration, and both male and female students exhibit similar perceptions and behaviors regarding disclosure.

Hypothesis 2: There is no significant difference in attitudes toward GenAI declaration across academic levels.

Table 9: Results of Kruskal–Wallis H Test Examining Differences in Students' Attitudes Toward Declaring Generative AI Use Across Academic Levels

Variable	Academic Level	N	Mean Rank	H (Chi-square)	df	p-value
Attitude toward GenAI Declaration	100 Level	48	176.20	2.87	3	0.412
	200 Level	86	182.45			
	300 Level	156	191.88			
	400 Level	84	186.73			

Table 9 shows the results of the Kruskal–Wallis H test assessing differences in attitudes across academic levels. The findings reveal no statistically significant difference among students in different academic levels ($H = 2.87$, $df = 3$, $p = 0.412$). As the p-value exceeds 0.05, the null hypothesis is accepted. This suggests that students' academic level does not significantly affect their attitudes toward declaring GenAI use, indicating a consistent pattern of attitudes across all levels of study.

Hypothesis 3: There is no significant relationship between students' attitudes toward GenAI declaration and their awareness of institutional policies.

Table 10: Results of Spearman Rank-Order Correlation Between Students' Attitudes Toward Declaring Generative AI Use and Awareness of Institutional Policies

Variables	N	Spearman's ρ	p-value
Attitudes toward GenAI Declaration vs Awareness of Institutional Policies	374	0.118	0.071

Table 10 presents the results of the Spearman rank-order correlation examining the relationship between students' attitudes toward GenAI declaration and their awareness of institutional policies. The results indicate a weak positive correlation ($\rho = 0.118$) that is not statistically significant ($p = 0.071$). Since the p-value is greater than 0.05, the null hypothesis is retained. This implies that there is no significant relationship between students' attitudes and their awareness of institutional policies, suggesting that awareness alone may not be sufficient to influence attitudes toward GenAI declaration.

Discussion

The findings of this study reveal that students in Nigerian library schools make extensive use of a wide range of generative artificial intelligence tools for academic writing, with conversational and content-generation systems emerging as the most dominant. This pattern reflects a strong preference for tools that support idea generation, drafting, and refinement of academic work. This finding aligns with previous studies which report that students strategically adopt generative AI tools based on perceived usefulness and task relevance (Adnan, 2025; Alsaeed et al., 2025; Farinosi & Melchior, 2025a). The prominence of multifunctional tools further supports the argument that students increasingly engage with AI not merely as support systems but as co-creative partners in academic tasks. This agreement with the literature reinforces the view that perceived performance benefits strongly drive adoption. Within the framework of the Unified Theory of Acceptance and Use of Technology, this finding can be explained by performance expectancy and effort expectancy, as students are more inclined to use technologies that enhance productivity and are easy to use (Venkatesh et al., 2003).

The study also shows that students are actively engaged in a variety of academic writing tasks, particularly routine forms such as assignments, term papers, and seminar work, while participation in advanced scholarly writing such as manuscript preparation is comparatively lower. This pattern suggests that students' engagement with academic writing is largely shaped by curriculum requirements rather than voluntary scholarly output. This finding is consistent with the literature, which indicates that students tend to use generative AI tools to support structured academic tasks that are integral to their coursework (Heil et al., 2025; Beckman et al., 2025). The relatively lower engagement in publication-oriented writing also reflects existing evidence that advanced academic writing requires higher levels of expertise and motivation. From a theoretical perspective, this aligns with facilitating conditions in UTAUT, as institutional structures and academic requirements determine the contexts in which students engage in writing activities.

In contrast, the findings on students' attitudes toward declaring the use of generative AI reveal a generally negative or hesitant disposition. Students do not strongly perceive declaration as necessary, and many express discomfort with disclosing their use of AI tools. At the same time, there is a notable concern that disclosure could negatively influence how their academic work is evaluated. This finding is consistent with prior studies that highlight students' ambivalent attitudes toward AI use, where perceived benefits coexist with ethical uncertainty and fear of consequences (Adnan, 2025; Adžić et al., 2024). It also aligns with evidence that students often operate within unclear ethical boundaries, leading to inconsistent attitudes toward disclosure (Farinosi & Melchior, 2025a). However, the finding partially contradicts studies that suggest a stronger ethical orientation among students, as the present results indicate that ethical considerations are often overshadowed by concerns about academic judgment. Within the UTAUT framework, this can be interpreted through social influence and perceived risk, where students' attitudes are shaped by expectations of lecturers and the perceived consequences of disclosure.

Closely related to attitudes, the study finds that the actual extent of declaring generative AI use is generally low and inconsistent. Students rarely acknowledge their use of AI tools in academic work and tend to disclose only when explicitly required. This behaviour indicates a gap between usage and transparency, reflecting a pattern of conditional compliance rather than intrinsic ethical commitment. This finding strongly supports existing literature, which identifies widespread non-disclosure and selective reporting of AI use among students (Nelson et al., 2025; Qu et al., 2025). It also reinforces the notion of "strategic non-disclosure," where students deliberately decide when and whether to acknowledge AI assistance. The findings further align with research showing that ethical awareness alone does not guarantee compliance with disclosure norms (Fang & Cai, 2025). From a UTAUT perspective, this behaviour can be linked to facilitating conditions, as unclear institutional expectations reduce the likelihood of consistent compliance.

The study further reveals that students' awareness of institutional policies on generative AI use is generally low, with many lacking a clear understanding of guidelines, expectations, and consequences. Although some students report receiving information from lecturers, this awareness appears fragmented and insufficient for guiding behaviour. This finding is consistent with previous studies that highlight a disconnect between general awareness of AI technologies and specific knowledge of institutional policies (Akça et al., 2025; Adnan, 2025). It also supports the argument that

inadequate communication and lack of structured training contribute to confusion and inconsistent practices among students. Within the UTAUT framework, this finding directly relates to facilitating conditions, as the absence of clear institutional support systems and policy communication limits students' ability to engage in responsible and compliant behaviour.

In terms of factors influencing disclosure decisions, the study finds that fear of academic penalties, lecturer expectations, absence of clear guidelines, and concerns about being judged are among the most influential factors. These findings are in strong agreement with the literature, which emphasizes the role of perceived risk, social influence, and psychological factors in shaping disclosure behaviour (Gonsalves, 2025; Hsiao & Tang, 2025). The influence of fear and uncertainty highlights the importance of contextual and emotional dimensions in students' decision-making processes. Additionally, the relatively weaker influence of institutional policies suggests that formal regulations alone may not be sufficient to drive compliance without effective communication and enforcement. These findings align closely with the UTAUT constructs of social influence and facilitating conditions, as both interpersonal expectations and institutional clarity significantly affect behavioural outcomes.

The findings on demographic differences indicate that students' attitudes toward declaring generative AI use do not significantly vary based on gender or academic level. This suggests that perceptions of AI disclosure are relatively uniform across different student groups. This finding is consistent with aspects of the literature that suggest demographic variables may have limited influence compared to cognitive and contextual factors (Tsaryk & Frick, 2025). However, it contrasts with the original propositions of UTAUT, which identify demographic factors such as gender and experience as potential moderators of technology-related behaviour (Venkatesh et al., 2003). The absence of significant differences in this study suggests that attitudes toward AI declaration may be more strongly shaped by shared academic environments and institutional contexts than by individual demographic characteristics.

Finally, the study finds no significant relationship between students' attitudes toward declaring AI use and their awareness of institutional policies. This indicates that awareness alone does not necessarily translate into positive attitudes or ethical behaviour. This finding is consistent with previous research showing that knowledge of policies does not automatically lead to compliance, particularly when ethical considerations are influenced by perceived risks and social norms (Akça et al., 2025; Tsaryk & Frick, 2025). It also reinforces the argument that behavioural outcomes are shaped by a complex interaction of factors rather than a single determinant. Within the UTAUT framework, this highlights the limitation of facilitating conditions when they are not supported by strong social influence and perceived benefits of compliance. In sum, the findings of this study largely align with existing literature in demonstrating widespread use of generative AI tools, inconsistent disclosure practices, and the influence of contextual and psychological factors on student behaviour. At the same time, the study contributes new insights by highlighting the weak link between policy awareness and disclosure behaviour, as well as the limited role of demographic factors. The application of UTAUT provides a useful explanatory framework, showing that students' engagement with generative AI and their disclosure decisions are shaped by performance expectations, social pressures, and institutional support systems.

Implications of the Study

The findings of this study carry important implications for both policy development and academic practice within Nigerian higher education, particularly in library and information science programmes. From a policy perspective, the widespread use of generative artificial intelligence tools alongside low levels of declaration highlights a clear need for the development of explicit, coherent, and accessible institutional policies on AI use. The current situation, where students demonstrate limited awareness and understanding of guidelines, suggests that existing policies are either insufficient or poorly communicated. Institutions must therefore move toward establishing comprehensive frameworks that clearly define acceptable and unacceptable uses of generative AI, as well as the expectations for disclosure across different types of academic tasks. Such policies should go beyond general statements and provide practical guidance, including examples of when and how to acknowledge AI use. In addition, the finding that students are more likely to disclose AI use only when explicitly required implies that policy enforcement mechanisms must be strengthened. This may involve embedding disclosure requirements within assignment instructions, assessment rubrics, and academic integrity regulations to ensure consistency and compliance.

The findings also suggest that policy initiatives should address students' fears and misconceptions about the consequences of disclosure. Since many students perceive that declaring AI use may negatively affect their academic evaluation, institutions must ensure that policies are framed in a way that encourages transparency rather than discourages it. This includes promoting a culture where responsible AI use is recognized as part of legitimate academic practice, rather than automatically associated with misconduct. Clear communication from institutions and lecturers regarding the purpose of disclosure such as promoting transparency and ethical scholarship can help to reduce anxiety and build trust among students.

In terms of practice, the findings indicate the critical role of lecturers and academic staff in shaping students' understanding and behaviour. The evidence that students rely significantly on lecturer guidance for information about AI policies suggests that instructors serve as key intermediaries between institutional frameworks and student practice. As such, there is a need for lecturers to be adequately trained and supported to provide consistent and accurate guidance

on AI use and disclosure. This includes integrating discussions of generative AI into teaching, offering clear instructions on assignment expectations, and modelling appropriate disclosure practices. Lecturers should also consider redesigning assessment strategies to account for the presence of AI tools, focusing more on critical thinking, originality, and process-based evaluation. Furthermore, the findings indicate the need for structured educational interventions to improve students' ethical awareness and practical understanding of AI use. While students are highly engaged with AI tools, their limited understanding of institutional expectations and ethical implications suggests a gap in digital and AI literacy. Institutions should therefore incorporate formal training programmes, workshops, or curriculum components that address responsible AI use, academic integrity, and disclosure practices. Such initiatives would help students move from mere tool usage to informed and ethical engagement. Finally, the finding that demographic factors such as gender and academic level do not significantly influence attitudes toward AI declaration suggests that interventions should be broadly targeted rather than limited to specific student groups. Institution-wide strategies are therefore more appropriate, ensuring that all students receive consistent information, training, and support regardless of their background or level of study.

Conclusion

The study concludes that generative artificial intelligence has become an integral part of academic writing practices among students in Nigerian library schools, with widespread adoption driven primarily by the perceived usefulness and ease of use of these tools. Students actively engage with a variety of AI applications, particularly for routine academic tasks such as assignments, term papers, and seminar writing, indicating that these technologies are now embedded in their everyday learning processes. However, this high level of usage is not matched by a corresponding level of transparency, as students demonstrate generally weak and hesitant attitudes toward declaring their use of generative AI in academic work.

The findings further reveal that the actual practice of declaring AI use is low and inconsistent, with most students only disclosing their use when explicitly required. This indicates a significant gap between engagement with AI tools and adherence to principles of academic transparency. Students' reluctance to declare usage is largely influenced by fear of negative academic consequences, concerns about being judged, and the perception that minor forms of AI assistance do not warrant acknowledgment. These concerns are compounded by limited awareness and poor understanding of institutional policies, suggesting that many students operate within an environment of ambiguity and uncertainty regarding acceptable practices.

Additionally, the study establishes that students' attitudes toward declaring AI use are not significantly influenced by gender or academic level, indicating that these perceptions are broadly shared across different demographic groups. It also finds that awareness of institutional policies does not significantly translate into positive attitudes toward disclosure, highlighting that knowledge alone is insufficient to drive ethical behaviour. Instead, disclosure practices are shaped by a complex interaction of psychological, social, and institutional factors. Generally, the study concludes that while generative AI offers substantial benefits for enhancing academic productivity, its integration into academic writing has introduced important challenges related to transparency and academic integrity. The absence of clear, well-communicated institutional guidelines, combined with students' concerns about potential consequences, has resulted in inconsistent and often limited disclosure practices. The study therefore indicates the need for universities to move beyond mere awareness creation and develop comprehensive, supportive frameworks that promote clarity, build trust, and encourage responsible and transparent use of generative AI in academic work.

Based on the findings and conclusion of this study, the following recommendations have been proposed:

1. University management should develop and implement clear, comprehensive, and accessible policies on generative AI use and disclosure, including explicit guidelines on when and how students are required to declare AI assistance.
2. Lecturers should embed mandatory AI disclosure requirements into assignment instructions and grading rubrics, while also clearly communicating that responsible AI use will not automatically lead to penalization.
3. LIS educators should integrate structured training on ethical AI use, academic integrity, and disclosure practices into the curriculum to strengthen students' professional responsibility toward transparent information use.
4. Library schools should organize regular workshops and orientation programmes to improve students' understanding of AI policies, reduce fear of negative evaluation, and promote a culture of ethical and transparent AI usage.
5. Students should adopt responsible academic practices by consistently declaring their use of generative AI tools, recognizing that transparency is a core component of academic integrity and their future professional roles.

Limitations and Suggestions for Further Studies

This study is not without limitations. First, the use of a cross-sectional survey design means that data were collected at a single point in time, which limits the ability to capture changes in students' attitudes and behaviours toward generative AI declaration over time. As the use of AI tools in education is rapidly evolving, students' perceptions and practices may shift with increased exposure, policy development, and institutional interventions. Second, the study relied on self-reported data, which may be subject to social desirability bias or underreporting, particularly given the sensitivity surrounding academic integrity and non-disclosure of AI use. Students may have provided responses they perceived as acceptable rather than fully reflecting their actual practices. Third, the adoption of a convenience sampling technique

restricts the generalizability of the findings. Although efforts were made to include institutions across the six geopolitical zones of Nigeria, the sample may not fully represent all library and information science students in the country. Additionally, the study focused specifically on students within library and information science programmes, which may limit the applicability of the findings to other academic disciplines where the nature and expectations of AI use may differ. Another limitation lies in the exclusive use of quantitative methods, which, while useful for identifying patterns and relationships, do not provide deeper insights into the underlying reasons, motivations, and contextual nuances influencing students' disclosure behaviours. Finally, the study examined awareness of institutional policies but did not assess the actual content, quality, or enforcement of these policies, which could play a significant role in shaping student behaviour.

In light of these limitations, several directions for further research are suggested. Future studies could adopt longitudinal designs to examine how students' attitudes and disclosure practices evolve over time, particularly as institutional policies and AI literacy initiatives become more established. There is also a need for qualitative or mixed-methods research to explore in greater depth the motivations, perceptions, and contextual factors that influence students' decisions to declare or not declare AI use. Expanding the scope of research to include students from other academic disciplines would provide comparative insights and enhance the generalizability of findings across higher education contexts. In addition, future studies could investigate the perspectives of lecturers and academic administrators to better understand how institutional expectations, assessment practices, and policy enforcement shape student behaviour. Further research may also examine the effectiveness of specific interventions, such as policy reforms, training programmes, and assessment redesign, in promoting transparent and ethical AI use. Finally, studies that critically analyse the content, clarity, and implementation of institutional AI policies would provide valuable evidence for improving policy frameworks and ensuring that they effectively support responsible academic practices.

Abstract

This paper emphasizes the growing necessity for libraries to adjust to technological developments and improve the ways in which users access knowledge. The study examined the role of AI in transforming reference services in Nigerian university libraries, with particular focus on the current status of reference services, the various applications of AI, and the potential benefits of integrating AI into service delivery. The study adopted an empirical approach, drawing on observation, review of existing literature and documented practices, and structured questionnaires administered to library staff and library users. Data were analyzed descriptively to identify patterns in awareness, utilization, and challenges of AI adoption. The findings revealed that there is a high level of awareness and interest in the implementation of AI among librarians, library staff, and students. However, the actual utilization of AI remains relatively low. The study also underscores challenges affecting the harnessing of AI into reference services, including inadequate funding, a lack of technical skills, poor infrastructure, unreliable power supply, and limited internet connectivity.

Keywords: Artificial Intelligence (AI), Nigerian University Libraries, Reference Services.

Introduction:

Among other industries, education has undergone major transformations due to artificial intelligence (AI). The potential of AI to revolutionize library services is now being recognized by Nigerian universities. Libraries have long served as essential repositories of knowledge, adapting to evolving societal needs and technological advancements (Abdullahi, 2023). Traditionally, academic libraries have been seen as knowledge repositories that offer access through carefully chosen print collections and reference services (Ramadevi & Bhatt, 2026). There are many advantages to utilizing AI in university libraries, including better information processing, higher efficiency, and better services. Additionally, AI can simplify activities like cataloging, archiving, and indexing, enabling librarians to concentrate on more demanding duties. They emphasize the important role that libraries play in higher education by providing information to all users, regardless of age, background, gender, or religion.

Libraries are constantly changing in response to shifting demands for knowledge and technology. In order to remain current and accessible, they must adjust to the quick rate of technological development. AI is transforming libraries into technologically advanced and user-centric institutions. It is causing significant changes in the field of library and information professions (Akinola, 2023). Innovation is becoming a crucial requirement for academic libraries (Ramadevi & Bhatt, 2026).

Reference services have long been a part of libraries. They connect users with a large amount of information. The reference desk is a counter where individuals may sit in the library. The library reference desk has always been a resource for individuals seeking information. They can also get help from them over the phone or by mail, which might take a while to get an answer. Because things are changing with technology, it makes sense to have a reference service. This is like an upgrade to the usual way of rendering library services. The main function of online reference services is to help librarians and people who use the library converse with each other through digital means.

University libraries are not just buildings that hold books and information. It could be physical, digital, or in cloud space. Their primary responsibility is to guarantee that individuals have access to the knowledge they require. University libraries use technology like mobile phones, cloud computing, and artificial intelligence to assist people. This includes different forms of AI such as expert systems, natural language processing, and machine learning. AI is modelled after human intelligence to adapt, recognize, and process information and is increasingly changing the ways and manner people handle certain tasks (Omeluzor, 2024). However, studies show that Nigerian university libraries have not fully adopted the use of Artificial Intelligence.

Several problems hinder Nigerian university libraries from incorporating Artificial Intelligence. These hinderances include: the lack of computer skills and technical knowledge to use AI tools effectively amongst library staff. Insufficient funding to afford necessary AI tools for libraries, lack of open-mindedness among librarians (Akinola, 2023), poor power supply, poor internet connectivity, privacy and ethical issues, and lastly, concern that AI will cause library staff to lose their jobs. To abate these obstacles, necessitated or prompt the study of harnessing artificial intelligence to transform reference services in Nigeria universities.

1.1 Objectives of the study

The study aims to achieve the following objectives:

1. To examine the status quo of reference services in Nigerian university libraries.
2. To explore the various applications of Artificial Intelligence in library reference services.
3. To analyze the potential benefits of integrating Artificial Intelligence into reference services in Nigerian university libraries.

Research Questions

1. What is the current status of reference service in Nigerian university libraries?
2. What are the various applications of artificial intelligence in library reference services?
3. What are the potential benefits of integrating AI into reference services in Nigerian university libraries?

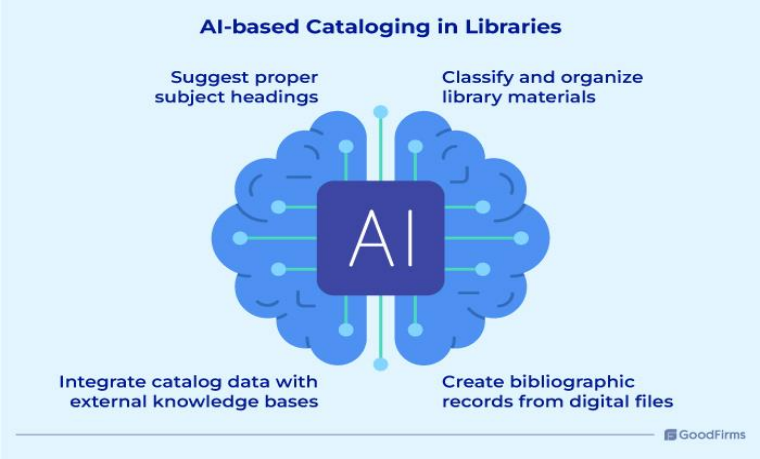
Literature Review:

The field of artificial intelligence has seen a considerable surge in popularity in recent years, especially in 2023. Several scholars see artificial intelligence as a critical field that all businesses must deal with. Artificial Intelligence, which is the latest in the development, has been viewed as one of the evolutionary technological tools that has brought about tremendous change in the operations and services of the library (Harriet, 2024). One of the most significant aspects of artificial intelligence is that it may be used in a variety of applications. The Oxford English Dictionary defines AI as the capacity of computers, or other devices, to exhibit intelligent behavior. This suggests that AI systems can occasionally outperform humans and appear to reason, learn, and act like them. The Association for the Advancement of Artificial Intelligence (AAAI) defines artificial intelligence as the scientific understanding of the mechanisms behind thought and intelligent behaviour.

Current Status of Reference Service Using AI:

The father of artificial intelligence, John McCarthy, defines it as the science and engineering of making intelligent robots, with an emphasis on intelligent computer software. Innovations in library and information science, in particular, are constantly expanding the horizons of what is possible for humans. In the last seven decades, storage technologies have progressed from solid-state drives, floppy disk drives, and hard disk drives. Based on user preferences and browsing history, these smart artificial intelligence (AI) systems may offer customized recommendations, help with reference services, and even respond to frequently asked questions. By utilizing sentiment analysis (Odigie, 2024) and natural language processing (NLP), these chatbots are able to have meaningful conversations with users and provide help when needed.

Figure 1: AI-based Cataloging in Libraries



Source: Mupaikwa (2024)

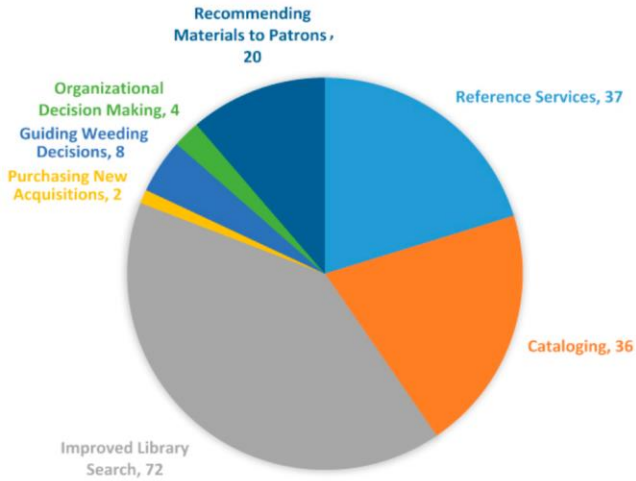
AI in Reference Services

As virtual reference services replace desk-reference library services, some conventional library functions have been taken over by technology, indicating that they may soon become obsolete. One of the major library sections is the reference service industry, which has been greatly impacted by these technological developments (Mupaikwa, 2024). It is not possible to depend on chatbots to mimic human intelligence and emotional expression. However, chatbots may be a cheap way to respond to the majority of common reference queries and point users in the right direction for help.

Digital reference assistants are intended to enhance the regular operations of reference desks and increase service productivity (Nawaz, 2020), not to take the place of individuals or reduce human interaction.

In their essay, Nawaz & Saldeen (2020) discussed the benefits of AI chatbots in reference services. They are as follows: Chatbots allow multiple users to benefit from chat services simultaneously. As a result, users have 24/7 access to chatbots that can maintain ongoing conversations and provide timely, reliable answers. Users can easily access them from anywhere at any time, even when the library is closed. Globally, university libraries have begun deploying chatbots to support reference services, including responding to frequently asked questions, assisting with database navigation, and providing basic research support (Folorunso & Kaltumi, 2025). ChatGPT can aid with technical and reader services such as answering basic reference inquiries, navigating the library website, and assisting with research, cataloguing, classification, and collection development (Adetayo, 2023).

Figure 2: Pie Chart Illustrating areas in academic libraries where employees would like to see AI introduced.



Source: Lund et al (2020)

The pie chart above, by Lund, Omame, Tijani, and Agbaji (2020), illustrates the areas in academic libraries where employees would like to see AI introduced. The highest proportion, 72%, favoured improvements in library search systems, while reference services were the second-highest category at 37%, with the remaining categories distributed across other library functions. This reveals that while introducing and strengthening search systems is the most paramount need, there is clear awareness among library employees that reference services could also benefit significantly from harnessing AI into library services.

The current state of reference services in Nigerian university libraries:

Okeke, Oghenetega, and Nwabu (2013) did research on the reference and information services offered by academic libraries in Federal Polytechnic, Oko, Anambra State University, Nnamdi Azikiwe University, and Madonna University, all of which are located in Anambra State, Nigeria. According to the study's findings, the reference and information services provided by these libraries were inadequate, and the only area where students expressed satisfaction was with photocopying materials. Furthermore, Madukoma (2015) discovered that the reference services at the Babcock University Library in Ogun State, Nigeria, were insufficient and underutilized. Oyewole and Belau (2021) in their research on the availability and usage of electronic reference services at Bells University in Ogun State, Nigeria, found that the main ones were emailing questions to the librarian, phone conversations with the librarian, and internet chats with the librarian. In addition, the research by Uzoigwe and Eze (2018) on the perceived benefits of reference services in Nigerian University Libraries found that the majority of Nigerian university libraries offer reference services and that the majority of students expressed a high level of satisfaction. Among the reference services they highlighted were access, e-journals, ICT supply in reference services, and user education.

Reference librarians' public image has also been examined. In contrast to the majority of Florida students who thought reference librarians were helpful, Kampen-Breit and Cooke's (2015) study revealed that these students were reluctant to approach them for help since their past experiences with reference librarians were perceived as unpleasant and obnoxious. Successful AI implementation in Nigerian libraries requires more than technological solutions alone. Equally important are organizational factors (leadership commitment, staff development), contextual adaptations (localization, infrastructure planning), and sustainable implementation models that balance innovation with practical constraints (Umoru, 2025).

Application of Artificial Intelligence in Library Reference Services:

Application of AI tools for reference service delivery in libraries Reference service is defined as a part of library administration that deals with the assistance given to patrons in their use or quest for resources of the library. According to Honghai (2020), reference service helps to establish contact between a user and the right document at the right time, thereby saving the time of the user. Credited with the founding of library reference service, Green (1876) as cited in

Honghai (2020) said in a paper read at a meeting of the American Library Association, that a librarian should be as unwilling to allow an inquirer to leave the library with his question unanswered as a shop-keeper is to have a customer go out of his store without making a purchase. Apart from requesting for on-desk services, reference is increasingly conducted via phone calls, chat and e-mail. If online book stores are now very smart with almost accurate recommendations, then a digital library cannot afford to offer less. Traditionally, reference services were provided in person at a specific desk within the library building, over the phone, and by letter (Cordell, 2013).

Potential Benefits of Integrating AI into Reference Services:

The benefits of the use of AI tools for reference service delivery in libraries, according to Ashikuzzaman, (2024), posited that AI chatbots have emerged as a transformative force in libraries, promising to revolutionize user experience with their ability to provide instantaneous assistance and access to information. These digital assistants offer patrons the convenience of round-the-clock support and personalized interactions. The integration of these tools in libraries, academic libraries especially has significantly enhanced the patron experience, improved accessibility, and optimizing library operations, ensuring, libraries remain vital in the digital age. Additionally, AI tools such as chatbots and virtual assistants enable libraries to extend their services beyond traditional operating hours, ensuring patrons can access support and resources whenever needed. Integrating artificial intelligence (AI) tools into library services has revolutionized how patrons interact with and access information (Ajinyemi, 2023). These intelligent virtual assistants have become invaluable assets in enhancing user satisfaction by providing round-the-clock assistance, personalized support, and efficient information retrieval. With their ability to analyze queries, offer tailored recommendations, and continuously improve through machine learning algorithms, AI chatbots have reshaped the library experience, offering patrons unparalleled convenience and accessibility**.**

Theoretical Framework:

This research paper took into account the Theory of Technology Acceptance Model (TAM), which explains how to encourage users to accept and utilize technology. This theory provides a theoretical basis for understanding the adoption and impact of AI in reference services within Nigerian universities. In the context of this study, TAM is relevant in explaining how libraries, staff, and students perceive AI tools in reference services. When users believe that AI technologies such as chatbots are useful and easy to use, they are more likely to incorporate them in their service delivery. Chatbots offer promise in supporting librarians' roles across different library tasks (Okpala et al., 2024).

Methodology

This study adopted an empirical research design. An empirical approach is one that draws conclusions from observation, review of existing practices, and direct evidence gathered from those involved in the phenomenon under investigation. In this study, the researcher examined the role of artificial intelligence in transforming reference services in Nigerian university libraries by combining observation of current library practices, review of documented experiences reported in existing literature, and structured questionnaires administered to library staff and library users. This design allowed the researcher to ground findings in real observations and the reported experiences of those who provide and use reference services in Nigerian university libraries.

Discussion of Findings:

Current Status of Reference Service in Nigerian University Libraries

The findings from the literature review reveal that the current status of reference services in Nigerian university libraries is still predominantly traditional and underdeveloped in terms of technological integration. Existing practices continue to rely on face-to-face interactions, telephone communication, and basic electronic services such as email and simple online chats. This statement is strongly supported in the literature written by Okeke, Oghentega, and Nwabu (2013), who found that reference and information services in Nigerian academic libraries were generally inadequate and underdeveloped. Similarly, Madukoma (2015) reported that reference services in Babcock University library were insufficient and underutilized. Oyewole and Belau (2021) further observed that available electronic reference services are largely limited to basic communication tools rather than advanced digital systems. This situation reflects broader challenges within Nigerian academic libraries, including inadequate funding, poor infrastructure, unstable power supply, and weak internet connectivity (Akinola, 2023; Harriet, 2024). Hence, the current state of reference services can be described as transitional, positioned between traditional service models and emerging digital possibilities, but yet to fully embrace AI.

Various Applications of Artificial Intelligence in Library Reference Services:

Empirical analysis reveals that Artificial Intelligence has various applications in library reference services, even though its practical implementation in Nigerian university libraries remains limited. The literature points out several functional areas where AI can significantly enhance service delivery.

One of the most outstanding applications is the use of AI-powered chatbots to handle routine enquiries and frequently asked questions. Nawaz (2020) emphasized that AI systems can provide immediate and accurate responses to users,

thereby improving access to information. Nawaz & Saldeen (2020) further noted that chatbots enable synchronous interaction with multiple users and provide continuous reference support. In addition, AI technologies such as natural language processing (NLP) and machine learning promote more interactive and user-friendly communication between libraries and users. These technologies enable systems to interpret user questions and provide appropriate responses (Odigie, 2024).

AI is also applied in intelligent information retrieval systems, which enhance search accuracy and provide personalized recommendations based on user behaviour. Adetayo (2023) highlighted that AI tools such as ChatGPT can assist in supporting research processes.

Despite these identified applications, the gap between theoretical potential and actual implementation remains significant. This disparity aligns with the Technology Acceptance Model (TAM), which suggests that incorporation of AI is influenced not only by perceived usefulness but also by infrastructural readiness and ease of use (Okpala et al., 2024).

Potential Benefits of Integrating AI into Reference Services in Nigerian University Libraries

The empirical evidence explains that the incorporation of AI into reference services provides several benefits in terms of efficiency, accessibility, and overall service quality. A major benefit is the improvement in response time, as AI systems can process and respond to queries instantly. Nawaz (2020) observed that AI significantly enhances the speed and reliability of reference service delivery. Similarly, Satheesh (2024) noted that AI improves operational efficiency and user experience in library services.

Another key benefit is, unlike traditional reference desks, AI systems provide uninterrupted access to information, which leads to an increase in accessibility of library services (Nawaz & Saldeen, 2020). AI also contributes to the reduction of workload by handling repetitive enquiries, allowing librarians to concentrate on more complex tasks. This shift promotes professional productivity (Ramadevi & Bhatt, 2026).

However, the recognition of these benefits is subject to addressing major issues such as poor infrastructure and inadequate funding. Umoru (2025) emphasized that successful AI incorporation requires strategic planning, organizational readiness, and sustainable implementation models.

Overall, the empirical evidence suggests that while the benefits of AI in reference services are diverse, their full recognition in Nigerian university libraries relies on intentional and sustained efforts to overcome existing limitations.

Conclusion

This research has demonstrated that artificial intelligence holds significant potential to enhance reference services in Nigerian university libraries. Empirical evidence indicates that current reference services remain highly traditional, with limited technological integration, despite increasing recognition of AI (Okeke et al., 2013; Oyewole & Belau, 2021). The analysis further reveals that AI technologies such as chatbots can enhance service delivery by improving response time and accessibility (Satheesh, 2024). However, persistent challenges continue to prevent proper and effective implementation.

Abstract

This study investigated digital skills acquisition among librarians and its influence on innovative library service delivery in the National Open University of Nigeria (NOUN). The study adopted a descriptive survey research design. The population comprised professional librarians working in selected NOUN study centres across the six geopolitical zones of Nigeria and the university headquarters. Data were collected using a structured questionnaire designed to obtain information on the types of digital skills acquired, methods of skills acquisition, application of digital skills in distance learning library services, and challenges affecting effective digital skills development. Data were analysed using descriptive statistics, including frequency counts, percentages, mean scores, and standard deviations. The findings revealed that librarians possessed basic digital competencies such as online information searching, use of electronic databases, and management of digital resources. However, competencies in advanced digital areas essential for distance learning environments, including virtual reference services, learning management system integration, digital content creation, and online user engagement, were relatively low. The study further identified major challenges affecting digital skills acquisition and application, including limited training opportunities, inadequate ICT infrastructure, insufficient institutional support, and workload pressures. The findings also indicated that the acquisition and application of digital skills contributed positively to innovative library service delivery for distance learners. The study concluded that the extent of application of digital skills among librarians for innovative library service delivery in NOUN was moderate, as librarians demonstrated competence in basic digital operations but showed limited proficiency in advanced digital skills required for delivering innovative services in distance learning environments. The study recommended regular capacity-building programmes, improved ICT infrastructure, and stronger institutional support to enhance librarians' digital competencies and promote more innovative library service delivery.

Keywords: Digital Skills Acquisition, Librarians, Innovative Library Services, Distance Learning, ICT Competencies, National Open University of Nigeria.

Introduction

The rapid transformation of the global information environment, driven by advances in Information and Cmmunication Tchnologies (ICTs), has significantly reshaped the roles and responsibilities of librarians. In contemporary academic settings, particularly within distance learning institutions, traditional library practices are increasingly being complemented by digitally mediated services that support remote access, virtual learning, and real-time information delivery. This paradigm shift has made digital skills acquisition an indispensable requirement for librarians who are expected to provide innovative, user-centered, and technology-driven services (Adeleke&Olorunsola, 2020; Ezeani&Igwesi, 2012). Digital skills refer to the competencies required to effectively use digital technologies for accessing, evaluating, creating, and disseminating information. These competencies encompass a wide range of abilities, including information retrieval, database management, digital content creation, online communication, data curation, and the use of library management systems. Librarians equipped with such skills are better positioned to function efficiently in modern digital library environments and to support teaching, learning, and research activities in higher institutions (Ilomäki et al., 2016; Ng, 2012). In the context of the evolving knowledge economy, digital literacy is no longer optional but a core professional requirement for librarians seeking relevance in the 21st century (Aina, 2014). In Nigeria, the emergence of digital librarianship has been influenced by the increasing adoption of electronic resources, institutional repositories, and online learning platforms. However, studies have shown that while many librarians possess basic digital competencies, there are still gaps in advanced skills necessary for innovative service delivery. Challenges such as inadequate ICT infrastructure, inconsistent power supply, limited access to training opportunities, and insufficient funding continue to hinder effective digital skills acquisition among librarians (Okiy, 2010; Salaam & Okezie, 2018). These limitations are particularly significant in distance learning environments where digital proficiency is essential for supporting geographically dispersed learners.

The National Open University of Nigeria (NOUN), as the foremost open and distance learning institution in the country, operates within a technology-driven educational framework that relies heavily on digital information systems. Unlike conventional universities, NOUN delivers instruction through online platforms, electronic course materials, and virtual

learning environments. Consequently, librarians in NOUN are required to go beyond traditional roles of information custodians to become digital facilitators, information literacy instructors, e-resource managers, and virtual support providers. Their ability to acquire and apply digital skills directly influences the effectiveness of library service delivery and the overall learning experience of distance learners (Ojedokun&Owolabi, 2003; Yusuf & Balogun, 2011). Furthermore, the integration of emerging technologies such as artificial intelligence, big data, and cloud computing has expanded the scope of librarianship. Librarians are now expected to participate in knowledge creation, digital scholarship, and collaborative learning ecosystems, thereby enhancing student engagement and academic productivity in open and distance learning contexts (Lippincott, 2015; Cox, 2016). This evolution underscores the need for continuous professional development and strategic capacity building in digital competencies. Innovative library service delivery in distance learning environments involves the use of digital tools and platforms to provide seamless access to information resources, including e-books, online journals, databases, and institutional repositories. It also includes virtual reference services, online user education, digital archiving, and personalized information services. The effectiveness of these services depends largely on the extent to which librarians have acquired and can apply relevant digital skills. Without such competencies, the potential of digital library services to support flexible and inclusive education cannot be fully realized (Ezeani&Igwesi, 2012; Aina, 2014).

Statement of the Problem

The increasing adoption of digital technologies in open and distance learning institutions has transformed the nature of library services, requiring librarians to acquire and apply a wide range of digital skills to support remote learners effectively. In the National Open University of Nigeria (NOUN), library services are expected to be delivered through digital platforms that facilitate access to information resources, virtual assistance, online information literacy instruction, and other technology-driven services. However, concerns have been raised regarding the level of digital skills possessed by librarians and the extent to which such skills are applied in the delivery of innovative library services. Notwithstanding the investments in information and communication technologies, several factors such as inadequate ICT infrastructure, limited professional development opportunities, insufficient institutional support, and technological changes may affect librarians' acquisition and application of digital skills. These challenges have the potential to influence the quality and effectiveness of library services provided to distance learners. More so, although previous studies have examined ICT competencies and digital literacy among librarians, there is limited empirical evidence on how digital skills acquisition influences innovative library service delivery within the context of open and distance learning institutions, particularly the National Open University of Nigeria. This gap in knowledge creates the need for a study that investigates the digital skills acquired by librarians, the methods through which such skills are obtained, the extent to which the skills are applied in service delivery, and the challenges affecting their effective utilization.

The objectives of the Study

The study is guided by the following specific objectives:

1. To find out the level of digital skills possessed by librarians in the National Open University of Nigeria.
2. To identify the types of digital skills required for innovative library service delivery in a distance learning environment.
3. To investigate the extent to which librarians apply digital skills in delivering library services in the National Open University of Nigeria.
4. To find out the challenges affecting digital skills acquisition among librarians in the National Open University of Nigeria.

Research Questions

The following research questions will guide the study:

1. What is the level of digital skills possessed by librarians in the National Open University of Nigeria?
2. What types of digital skills are required for innovative library service delivery in a distance learning environment?
3. To what extent do librarians apply digital skills in delivering library services in the National Open University of Nigeria?
4. What are the challenges affecting digital skills acquisition among librarians in the National Open University of Nigeria?

Literature Review

The literature review examines existing scholarly works related to digital skills acquisition and its influence on innovative library service delivery. The review is organized in line with the objectives of the study, focusing on the level of digital skills possessed by librarians, the types of digital skills required for innovative service delivery in distance learning environments, the application of digital skills in library services, challenges affecting digital skills acquisition, and strategies for enhancing digital competencies among librarians. The review also identifies gaps in existing studies and provides a foundation for understanding the role of digital skills in improving library service delivery within open and distance learning institutions such as the National Open University of Nigeria (NOUN).

Level of Digital Skills Possessed by Librarians

Digital skills have become an essential requirement for librarians in contemporary information environments. These skills extend beyond basic computer literacy to include competencies in digital literacy, information management, online communication, and the use of emerging technologies. According to Ng (2012), digital skills encompass the ability to locate, evaluate, create, and communicate information using digital technologies. Similarly, van Laar et al. (2017) emphasized that librarians require a combination of technical, cognitive, and social competencies to function effectively in digital environments. In academic and distance learning institutions, librarians are expected to possess skills that enable them to support users in accessing and utilizing electronic information resources efficiently. Studies have shown that many librarians possess basic digital competencies such as internet searching, word processing, email communication, and database usage. However, proficiency levels vary across institutions and regions, particularly in developing countries where access to training and technological resources may be limited (Aina, 2014). Assessing the level of digital skills possessed by librarians is therefore necessary for determining their preparedness to deliver modern library services.

Types of Digital Skills Required for Innovative Library Service Delivery in Distance Learning Environments

The digital transformation of library services has created a demand for diverse digital competencies among librarians. Innovative service delivery requires skills in digital content creation, electronic resource management, virtual reference services, online information literacy instruction, database administration, learning management system integration, and social media engagement. The American Library Association (2019) noted that librarians must continuously update their technological competencies to remain relevant in changing information environments. In distance learning environments, librarians require additional skills that enable them to support users remotely. These include competencies in virtual communication, online collaboration tools, cloud-based technologies, and digital repository management. Hussain (2020) observed that the effectiveness of innovative library services depends largely on librarians' ability to utilize digital technologies creatively and efficiently. Consequently, identifying the specific digital skills required in distance learning environments is important for improving library service delivery.

Application of Digital Skills in Library Service Delivery

The acquisition of digital skills is meaningful only when such skills are effectively applied in library operations and services. Digital skills enable librarians to provide innovative services such as virtual reference assistance, online user education, institutional repository management, electronic resource provision, and remote access support. These services enhance accessibility, efficiency, and user satisfaction, particularly in institutions that serve geographically dispersed learners. Distance learning has significantly expanded the responsibilities of librarians beyond traditional service models. According to Moore and Kearsley (2012), librarians in distance education institutions play critical roles in facilitating access to information resources and supporting independent learning. UNESCO (2020) further emphasized that digital technologies have transformed library services into predominantly online and user-centred systems. In institutions such as the National Open University of Nigeria, effective application of digital skills is essential for meeting the information needs of distance learners.

Challenges Affecting Digital Skills Acquisition among Librarians

Despite the growing importance of digital competencies, several challenges hinder effective digital skills acquisition among librarians. Inadequate ICT infrastructure remains a major obstacle, particularly in developing countries where internet connectivity and technological facilities are often insufficient. Okiy (2010) identified poor funding, inadequate equipment, and limited access to training opportunities as significant barriers to digital skills development among librarians. Other challenges include resistance to technological change, heavy workloads, and limited institutional support for professional development. The World Bank (2021) also highlighted the digital divide and unequal access to technological resources as factors affecting digital competence development in many developing nations. These challenges can limit librarians' ability to acquire and apply the digital skills required for innovative service delivery.

Strategies for Enhancing Digital Skills Acquisition among Librarians

Enhancing digital skills acquisition requires deliberate institutional and professional interventions. Continuous professional development programmes, workshops, seminars, and online training opportunities are among the most effective approaches for improving librarians' competencies. The International Federation of Library Associations and Institutions (IFLA, 2021) emphasized the need for lifelong learning and continuous skills upgrading to address rapidly changing technological demands. Other important strategies include increased funding for ICT infrastructure, integration of digital competencies into Library and Information Science curricula, mentorship programmes, and collaboration among libraries and educational institutions. The Association of College and Research Libraries (2016) noted that institutional support is critical for sustaining digital competence development among librarians. These strategies can contribute significantly to improved library service delivery in digital and distance learning environments.

Empirical Review

Available studies indicate that digital skills play a significant role in enhancing library service delivery. However, most existing studies have focused on digital literacy, ICT competencies, or technology adoption among librarians in conventional academic libraries. There is limited empirical evidence specifically examining digital skills acquisition

and its influence on innovative library service delivery in open and distance learning institutions such as the National Open University of Nigeria. This gap in the literature justifies the need for the present study.

Summary of Literature Review

The literature reviewed indicates that digital skills are essential for effective and innovative library service delivery, particularly in distance learning environments. Librarians require a wide range of digital competencies to support electronic information services and remote learners. However, challenges such as inadequate infrastructure, insufficient training opportunities, and limited institutional support continue to affect digital skills acquisition. The reviewed studies also reveal limited empirical evidence on the influence of digital skills acquisition on innovative library service delivery within the context of open and distance learning institutions in Nigeria, thereby necessitating the present study.

Methodology

The design enabled systematic collection and quantitative analysis of data without manipulation of variables.The study was conducted at the National Open University of Nigeria (NOUN), an Open and Distance Learning (ODL) institution with study centres across Nigeria, where digital technologies are central to library service delivery. The population comprised 65 professional and para-professional librarians, and due to the manageable size, a census sampling technique was employed, allowing all members of the population to participate. Data were collected using a structured questionnaire titled Digital Skills Acquisition and Innovative Library Service Delivery Questionnaire (DSAILSDQ), organized into sections covering demographic information, digital skills, service delivery, challenges, and improvement strategies. The instrument was based on a four-point Likert scale. The collected data were analyzed using descriptive statistics of mean and standard deviation, with a criterion mean of 2.50 used for decision-making.and inferential statistics (Pearson Product Moment Correlation).

Data Presentation and Discussion of the Findings

This study examined digital skills acquisition among librarians and its implications for innovative library service delivery in a distance learning context. The findings are discussed in relation to existing literature.

Table 1: Level of Digital Skills Acquisition (N = 65)

S/N	Digital Skills Acquisition	SA	A	D	SD	Mean	Decision
1	I possess basic computer operation skills (e.g., MS Word, Excel, PowerPoint).	40	20	5	0	3.54	Accepted
2	I am proficient in the use of library management software (e.g., KOHA).	30	25	10	2	3.31	Accepted
3	I have the ability to manage electronic databases effectively.	25	28	12	2	3.20	Accepted
4	I am skilled in online information retrieval and advanced search techniques.	35	22	8	2	3.42	Accepted
5	I can effectively use institutional repositories for information storage and retrieval.	20	30	15	3	3.08	Accepted
6	I possess skills in digital cataloguing and metadata creation (e.g., MARC).	18	27	20	5	2.97	Accepted
7	I am competent in using online communication tools (e.g., Zoom, Google Meet).	33	24	8	2	3.38	Accepted
8	I have skills in managing digital library platforms and services.	22	26	17	5	3.08	Accepted
9	I am capable of troubleshooting basic ICT-related problems.	15	20	30	10	2.46	Rejected
10	I engage in continuous learning to improve my digital competencies.	28	25	12	3	3.25	Accepted

Table 1indicated that librarians in the National Open University of Nigeria possess a moderate to high level of digital skills, as reflected in the generally high mean scores across most items. Core competencies such as basic computer operations (Mean = 3.54), online information retrieval (Mean = 3.42), and use of online communication tools (Mean = 3.38) were strongly affirmed, suggesting that librarians are well-equipped with foundational digital capabilities required for contemporary library services. Similarly, competencies in database management (Mean = 3.20), use of library management software (Mean = 3.31), and engagement in continuous digital learning (Mean = 3.25) were also rated positively, indicating a reasonable level of professional adaptability in a technology-driven environment. However, a notable exception is ICT troubleshooting skills (Mean = 2.46), which fell below the acceptance threshold. This suggests

a critical gap in technical problem-solving abilities, which may hinder efficient service delivery, especially in a digital and remote learning context.

Overall, the findings imply that while librarians demonstrate competence in general digital operations, there is a need to strengthen advanced and technical digital skills to enhance service effectiveness.

Table 2: Innovative Library Service Delivery (N= 65)

S/N	Library Service Delivery	SA	A	D	SD	Mean	Decision
1	I provide virtual reference services to users.	30	28	5	2	3.32	Accepted
2	I participate in online user education and information literacy programmes.	28	27	8	2	3.25	Accepted
3	I support remote access to electronic information resources.	32	26	5	2	3.35	Accepted
4	I contribute to the development and management of digital repositories.	25	27	9	4	3.12	Accepted
5	I use social media platforms to deliver library services.	20	25	12	8	2.88	Accepted
6	I assist users through email and online chat services.	33	25	5	2	3.37	Accepted
7	I develop digital content for library users (e.g., tutorials, guides).	18	25	14	8	2.82	Accepted
8	I support e-learning platforms with relevant library services.	30	26	7	2	3.29	Accepted
9	I provide current awareness services (CAS) using digital tools.	28	27	8	2	3.25	Accepted
10	I participate in collaborative digital library initiatives.	25	28	8	4	3.14	Accepted

Grand Mean = 3.18

Table 2 revealed that a broad range of digital service-related competencies are widely recognized and required, as evidenced by the high grand mean of 3.18. Librarians strongly affirmed the importance of skills such as email and online user support (Mean = 3.37), remote access facilitation (Mean = 3.35), and virtual reference services (Mean = 3.32), highlighting the centrality of digital interaction in service delivery. Additionally, competencies related to e-learning support (Mean = 3.29), current awareness services (Mean = 3.25), and participation in collaborative digital initiatives (Mean = 3.14) further emphasize the evolving role of librarians in digitally mediated learning environments. Although slightly lower, skills such as digital content development (Mean = 2.82) and social media service delivery (Mean = 2.88) were still accepted, indicating emerging but less fully developed areas of practice. Overall, the results underscore that innovative library service delivery in distance learning environments requires a diverse set of digital, communication, and content development skills, with particular emphasis on user-centered and remote service capabilities.

Table 3: Relationship between Digital Skills and Service Delivery (N = 65)

S/N	Relationship Between DS and SD	SA	A	D	SD	Mean	Decision
1	Digital skills enhance my ability to deliver innovative library services.	40	22	2	1	3.55	Accepted
2	My level of ICT proficiency influences the quality of services I provide.	38	24	2	1	3.52	Accepted
3	Digital competencies improve user satisfaction in library services.	42	20	2	1	3.57	Accepted
4	Lack of digital skills limits effective service delivery.	35	25	4	1	3.45	Accepted
5	Continuous digital training improves library service innovation.	39	23	2	1	3.54	Accepted
6	Digital literacy is essential for supporting distance learners.	41	21	2	1	3.55	Accepted
7	My digital skills enable me to adapt to emerging technologies.	37	24	3	1	3.49	Accepted
8	There is a strong link between digital skills and library service efficiency.	38	23	3	1	3.51	Accepted

Grand Mean = 3.52

Table 3 findings showed that digital skills are applied to a high extent in library service delivery, as reflected in the grand mean of 3.52. Respondents strongly agreed that digital skills enhance service delivery (Mean = 3.55), improve

user satisfaction (Mean = 3.57), and support distance learners (Mean = 3.55).Furthermore, the results indicate that ICT proficiency significantly influences service quality (Mean = 3.52) and enables librarians to adapt to emerging technologies (Mean = 3.49). The strong agreement that digital skills improve service efficiency (Mean = 3.51) and innovation (Mean = 3.54) highlights the strategic importance of digital competence in modern librarianship. The consistent high ratings across all items suggest that librarians are not only aware of digital tools but are actively leveraging them to enhance service delivery.

Overall, the findings demonstrate that digital skills are integral to effective and innovative library services, particularly in a distance learning environment.

Table 4: Challenges Affecting Digital Skills Acquisition (N = 65)

S/N	Challenges	SA	A	D	SD	Mean	Decision
1	Inadequate ICT infrastructure affects my digital skills acquisition.	42	20	2	1	3.58	Accepted
2	Poor internet connectivity hinders effective use of digital tools.	45	18	1	1	3.66	Accepted
3	Lack of regular training programmes limits skill development.	38	22	4	1	3.49	Accepted
4	Insufficient funding affects access to digital tools and training.	40	20	4	1	3.52	Accepted
5	Resistance to change affects adoption of digital technologies.	20	28	12	5	2.97	Accepted
6	Limited access to modern library technologies hinders performance.	35	25	4	1	3.45	Accepted
7	Heavy workload limits time for acquiring digital skills.	30	25	8	2	3.28	Accepted
8	Lack of institutional support affects digital skills acquisition.	35	25	4	1	3.45	Accepted

Grand Mean = 3.42

Table 4 results indicated that indicated that librarians face significant challenges in acquiring and utilizing digital skills, with a high grand mean of 3.42. The most prominent challenges include poor internet connectivity (Mean = 3.66), inadequate ICT infrastructure (Mean = 3.58), and insufficient funding (Mean = 3.52). These findings highlight systemic and infrastructural limitations that constrain digital capacity development. Additionally, lack of training opportunities (Mean = 3.49) and limited access to modern technologies (Mean = 3.45) further compound the problem, suggesting that both resource availability and capacity-building initiatives are insufficient. Although comparatively lower, resistance to change (Mean = 2.97) still emerged as a notable factor, indicating some level of behavioral or organizational inertia.

Overall, the findings suggest that institutional, technological, and financial barriers significantly impede digital skills acquisition, thereby limiting the effectiveness of library service delivery.

Implications of the Study

The study underscores the importance of digital skills in promoting effective and innovative library service delivery in Open and Distance Learning environments. It implies that librarians require continuous professional development to enhance their digital competencies and adapt to emerging technologies. The study further highlights the need for adequate institutional support through improved ICT infrastructure, funding, and enabling policies to facilitate digital transformation in libraries. Enhanced digital competence among librarians can improve access to electronic resources, increase user satisfaction, and strengthen support for teaching, learning, and research. Overall, digital competence, continuous training, institutional support, and technology adoption remain essential for sustaining innovative library services and improving the effectiveness of academic libraries.

- **Level of Digital Skills Possessed by Librarians**

  The findings revealed that librarians in the National Open University of Nigeria possess a moderate to high level of digital skills, particularly in basic computer operations, online information retrieval, and the use of communication tools. This suggests that librarians have adapted to the digital transformation of library services, especially in Open and Distance Learning (ODL) environments. This result aligns with the work of Ezeani and Igwesi, who reported that librarians in Nigerian academic institutions demonstrate competence in basic ICT applications but require further training in advanced digital tools. Similarly, Aina emphasized that while librarians possess foundational digital literacy, the rapid evolution of information technologies demands continuous upgrading of skills. However, the study identified a significant gap in ICT troubleshooting skills, indicating limited technical depth. This supports findings by Ogunsola, who noted that inadequate technical expertise remains a major constraint in the effective deployment of digital library systems in developing countries.

- **Types of Digital Skills Required for Innovative Service Delivery**

  The study further revealed that a wide range of digital competencies including virtual reference services, remote access support, e-learning facilitation, and digital communication are essential for innovative library service delivery. This finding corroborates the position of Davis, whose Technology Acceptance Model (TAM) emphasizes that the usefulness and ease of use of technology significantly influence its adoption in professional settings. In the context of librarianship, digital skills enhance the perceived usefulness of library services among

users. Additionally, the importance of digital content creation and social media usage, though less strongly developed, reflects emerging trends in librarianship. This is consistent with studies that highlight the evolving role of librarians as digital content curators and online service facilitators, rather than mere custodians of print resources.

- **Extent of Application of Digital Skills in Service Delivery**

  The findings indicate that librarians apply digital skills to a high extent, particularly in enhancing service delivery, improving user satisfaction, and supporting distance learners. This suggests that digital competencies are not only present but are being effectively utilized in practice. This aligns with findings by Ezeani, who observed that ICT integration in library services significantly improves access to information resources and service efficiency. The ability of librarians to adapt to emerging technologies also reflects a growing culture of innovation within the profession. Furthermore, the strong agreement that digital skills enhance service efficiency and innovation supports the argument that digital competence is a key driver of modern library performance, particularly in ODL institutions where physical interaction is limited.

- **Challenges Affecting Digital Skills Acquisition**

  Despite the positive findings, the study identified several significant challenges, including poor internet connectivity, inadequate ICT infrastructure, insufficient funding, and limited training opportunities. These challenges highlight systemic barriers that hinder effective digital skills acquisition. These findings are consistent with earlier studies by Ogunsola, who identified infrastructural deficiencies as a major obstacle to digital library development in Nigeria. Similarly, Aina noted that funding constraints and lack of institutional support limit the capacity of libraries to fully embrace digital transformation.

  The issue of workload and resistance to change also suggests organizational and behavioral challenges, which may affect the pace of digital adoption among librarians.

- **Strategies for Enhancing Digital Skills Acquisition**

  The study identified several effective strategies for enhancing digital competencies, including regular ICT training, improved infrastructure, better internet connectivity, institutional support, and professional development opportunities. These findings are in line with global best practices in librarianship, which emphasize continuous professional development as essential for adapting to technological change. The importance of training and infrastructure support reinforces the argument that digital transformation requires both human capacity development and technological investment.

  Moreover, the encouragement of self-directed learning and collaboration reflects a shift towards lifelong learning and knowledge sharing, which are critical in a rapidly evolving digital environment.

Summary of Findings

This study demonstrates that while librarians possess and apply digital skills effectively, their full potential is constrained by infrastructural and institutional challenges. The findings reinforce the view that digital skills are central to innovative library service delivery and that improving these skills requires a holistic approach involving training, policy support, and technological investment. In line with the Technology Acceptance Model, the study suggests that enhancing librarians' digital competencies will improve both the perceived usefulness and effectiveness of library services, thereby leading to better user outcomes in distance learning environments.

Conclusion

Digital skills are fundamental to innovative library service delivery in the National Open University of Nigeria (NOUN), where teaching, learning, and information services are largely technology-driven. The application of digital competencies enables librarians to provide innovative services such as virtual reference services, digital content management, remote user support, online information retrieval, and access to electronic resources for distance learners. As the demand for technology-based library services continues to increase, librarians require adequate digital competencies to effectively support teaching, learning, and research activities within the Open and Distance Learning environment.The effectiveness of innovative library service delivery depends largely on librarians' ability to acquire, update, and apply relevant digital skills in their daily operations. Therefore, strengthening digital competencies through continuous professional development, access to modern technologies, and institutional support is essential for sustaining innovation, improving service quality, and enhancing the overall effectiveness of library services in NOUN.

Recommendations

1. **Provision of Adequate ICT Infrastructure**

   The management of the National Open University of Nigeria should invest in modern ICT infrastructure and digital facilities to enhance librarians' opportunities for acquiring and applying digital skills in library operations and service delivery.

2. **Improvement of Internet Connectivity**

   Efforts should be made to provide reliable, stable, and high-speed internet connectivity in libraries to facilitate access to digital resources, online training platforms, and technology-based library services.

3. **Organization of Regular Training Programmes**

   Continuous professional development programmes, including workshops, seminars, and ICT training sessions, should be organized regularly to improve librarians' digital competencies and keep them abreast of emerging technologies.

4. **Increased Funding for Digital Skills Development**

   Adequate financial resources should be allocated to libraries for the acquisition of digital technologies, software applications, and staff training programmes aimed at enhancing digital skills acquisition.

5. **Promotion of Positive Attitudes toward Technological Change**

   Library management should implement awareness programmes and change management initiatives to encourage librarians to embrace technological innovations and reduce resistance to the adoption of digital technologies.

6. **Provision of Access to Modern Library Technologies**

   Libraries should be equipped with up-to-date digital tools, automated systems, and emerging technologies to facilitate practical exposure and improve librarians' technological proficiency.

7. **Reduction of Workload Constraints**

   Library management should review work schedules and provide adequate staffing to enable librarians to devote sufficient time to training, self-development, and digital skills acquisition activities.

8. **Strengthening Institutional Support**

   University authorities and library management should formulate supportive policies and provide incentives that encourage continuous learning, innovation, and the effective utilization of digital technologies among librarians.

Abstract

This study investigated the impact of information and communication technology (ICT) on the utilization of electronic information resources among students of katsina state institute of technology and management (KSTIM), and the specific objectives include: Identify the types of ICTs applied in the use of electronic resources in KSTIM, Katsina State, Ascertain the level of use of electronic information resources with the application of ICTs in the study area. The study adopted Quantitative Research Method and a descriptive survey design. The population of the study comprised all students of Katsina State Institute of Management Studies, numbering one thousand three hundred and five (1,305). 378 sample size and a proportionate stratified random sampling technique was employed, and the sample size was determined using Slovin's formula. A questionnaire was used as the instrument for data collection. The finding indicated that respondents generally disagreed that most ICT tools such as computers and laptops and the level of use of electronic information resources among respondents is generally low, as reflected in their disagreement. The study recommended the institution should improve ICT infrastructure by providing adequate facilities and stable internet connectivity to enhance access to electronic resources and Regular ICT training and capacity-building programmes should be organized to improve users' skills and increase the utilization of e-resources.

Keywords: Information and Communication Technology (ICT), Utilization, Electronic Information Resources, Students, Katsina State Institute of Technology and Management (KSITM).

Introduction

The rapid advancement of ICTs has fundamentally transformed the way information is generated, accessed, and utilized in contemporary academic environments. In an era where knowledge is increasingly digitized, students rely heavily on electronic information resources (EIRs) such as e-books, online journals, institutional repositories, and academic databases to support learning and research. Despite the availability of these resources, their effective utilization largely depends on the presence and functionality of Information and Communication Technologies (ICTs), which serve as the primary tools for accessing and managing electronic information (Graaf, 2023). This reality raises important concerns about the extent to which ICTs influence students' engagement with electronic resources, particularly in developing educational contexts.

This study is anchored on the critical role that ICT played in enhancing the accessibility and utilization of electronic information resources among students of KSITM, but their effectiveness is shaped by factors such as accessibility, user competence, and infrastructural support. Everinmene and Eze (2021) opine that ICTs encompass a wide range of technologies including computers, mobile devices, internet connectivity, software applications, and digital communication platforms that facilitate the storage, retrieval, and dissemination of information (Ghadulwo 2022). In educational settings, these tools act as enablers, allowing students to interact with electronic resources efficiently and effectively. Therefore, the level at which ICTs are available and properly utilized directly determines how well students can benefit from electronic information resources.

The application of ICTs in the use of electronic information resources is evident in various academic activities. For instance, students utilize internet-enabled devices to access scholarly databases such as Google Scholar, JSTOR, and ScienceDirect for research purposes. Library systems integrated with Online Public Access Catalogues (OPACs) allow users to locate materials quickly and conveniently. Learning Management Systems (LMS) such as Moodle and Google Classroom support teaching and learning by providing platforms for accessing lecture materials, submitting assignments, and participating in discussions (Ghadulwo 2022). Additionally, mobile technologies and cloud-based tools enable students to download e-books, stream educational content, and collaborate on academic tasks regardless of geographical limitations. These applications demonstrate how ICTs improve accessibility to quality information, enhance research skills, and support overall academic achievement.

However, the utilization of ICTs in accessing electronic information resources is not without challenges. Abubakar et. al. (2017) highlight that the major issues are limited ICT infrastructure, including inadequate computer systems, slow or unreliable internet connectivity, and insufficient access to digital libraries. Furthermore, many students face challenges related to inadequate digital literacy, which affects their ability to effectively search for, evaluate, and utilize

electronic information resources. Inconsistent power supply also poses a significant barrier, frequently disrupting access to ICT facilities and online resources. Other challenges such as high cost of internet services, lack of institutional support, and limited training opportunities further constrain the optimal use of ICTs. These factors collectively reduce the potential benefits that electronic information resources can offer to students.

Access to and proficiency in ICT tools determine the frequency and effectiveness of students' engagement with digital academic materials. Additionally, intervening factors such as infrastructure availability, training, and electricity supply play a moderating role in shaping students' use of electronic information resources. The study lies in the growing importance of ICT-driven education and the need to maximize the benefits of electronic information resources in higher institutions. As institutions like Katsina State Institute of Technology and Management (KSTIM) continue to adopt digital learning approaches, it is essential to assess how ICTs contribute to or hinder students' use of electronic resources. Understanding these dynamics will provide valuable insights for policymakers, educators, and administrators to improve ICT infrastructure, enhance digital literacy programs, and develop supportive policies. Ultimately, this study seeks to contribute to the improvement of academic performance, research efficiency, and overall educational development by promoting effective integration and utilization of ICTs in accessing electronic information resources.

Statement of the Problem

In academic environment, students are expected to have adequate access to functional Information and Communication Technologies (ICTs) and possess the necessary digital skills to effectively utilize electronic information resources (EIRs) for learning and research (Ghadulwo 2022; Graaf, 2023). Such an environment supports seamless access to online journals, e-books, and academic databases, thereby enhancing students' research capabilities, critical thinking, and overall academic performance. Higher institutions, including Katsina State Institute of Technology and Management (KSTIM), are increasingly adopting digital systems with the expectation that ICT integration will promote efficient information access and improve educational outcomes.

However, despite the availability of ICTs Infrastructure provided by high institution of learning but, the utilization of electronic information resources among students remains suboptimal due to several persistent challenges. These include limited ICT infrastructure, inadequate digital literacy, poor internet connectivity, and inconsistent power supply, all of which restrict students' ability to fully engage with available electronic resources. As a result, the expected benefits of ICT integration in high institution are not fully realized. Therefore, this study seeks to Identify the types of ICTs applied in the use of electronic resources in KSTIM, Katsina State, and ascertain the level of use of electronic information resources with the application of ICTs in the study area.

Objectives of the study

The study aims to:

1. Identify the types of ICTs applied in the use of electronic resources in KSTIM, Katsina State.
2. Ascertain the level of use of electronic information resources with the application of ICTs in the study area.

Literature Review

The application of Information and Communication Technologies (ICTs) plays a central role in facilitating access to and use of electronic resources in academic environments. Common ICT tools include computers, laptops, smartphones, internet connectivity, library management systems, institutional repositories, and digital databases. These technologies enable users to access e-books, e-journals, online databases, and other scholarly materials efficiently. For instance, internet-enabled devices allow students to retrieve academic content from platforms such as online journals and digital libraries, while institutional repositories support the storage and dissemination of theses and dissertations. For instance, Ghadulwo (2022) and Kuper, Sakibu, and Arthur (2018) emphasize that although students are generally aware of ICT tools like computers and online databases, actual usage is often limited to basic functions such as downloading lecture materials rather than engaging in advanced academic research. This suggests a gap between availability and effective utilization. Similarly, Abubakar and Adetimirin (2015) argue that computer literacy significantly influences the depth of e-resource usage, implying that without adequate ICT skills, users may underutilize available technologies. In addition, Abubakar, Gupiyem, and Banwar (2017) highlight that accessibility to ICT infrastructure, including reliable internet and functional devices, is a critical determinant of usage, yet many institutions in developing contexts still face infrastructural deficiencies that restrict optimal engagement with electronic resources.

Moreover, the integration of advanced ICT applications such as digitization tools, institutional repositories, and open science platforms has transformed access to scholarly information, but not without challenges. Everinmene and Eze (2021) note that digitization technologies enhance preservation and accessibility of academic works, yet their implementation is often hindered by inadequate funding, technical expertise, and maintenance issues. Likewise, Gautam and Sinha (2017) observe that while academic staff and researchers increasingly depend on e-journals and digital databases, disparities in ICT skills and uneven access to subscription-based resources limit their full benefits. Graaf (2023) further points out that the adoption of open science services by research libraries offers significant opportunities for collaboration and knowledge sharing; however, organizational and policy constraints can impede their effective deployment. The review showed that the diverse ICTs are available for supporting e-resource use, their impact is

constrained by systemic issues such as insufficient infrastructure, limited user training, and weak institutional support, thereby calling for a more integrated and sustainable approach to ICT development in academic libraries.

The level of use of electronic information resources with the application of ICTs has been widely examined, with evidence suggesting a moderate but uneven pattern of utilization across different academic contexts. Studies show that while awareness of e-resources is relatively high, the actual level of use often varies depending on access to ICT tools and user competence. For example, Ghadulwo (2022) found that undergraduate students demonstrate considerable awareness of e-resources, yet their usage is largely limited to basic academic needs such as assignments and lecture notes. Similarly, Kuper, Sakibu, and Arthur (2018) reported that although students are familiar with electronic databases and online resources, the frequency of use remains inconsistent due to challenges such as limited access to computers and unreliable internet connectivity. In the Nigerian context, Akinola et al. (2020) observed that postgraduate students make significant use of e-journals for research purposes; however, their usage is often constrained by access barriers and limited ICT proficiency. This suggests that the presence of ICTs alone does not automatically translate into high-level or sustained use of electronic information resources.

Abubakar and Adetimirin (2015) emphasize that higher levels of computer literacy are associated with increased and more effective use of electronic resources among postgraduate students. Supporting this, Abubakar, Gupiyem, and Banwar (2017) identify ICT accessibility as a significant correlate of e-resource usage, noting that students with better access to digital tools and stable internet are more likely to engage frequently with electronic materials. On a broader scale, Gautam and Sinha (2017) found that faculty members and research scholars exhibit relatively higher levels of usage compared to students, largely due to their research demands and familiarity with ICT applications. Meanwhile, emerging ICT-driven initiatives such as digitization projects and open science platforms have the potential to enhance usage levels by improving accessibility and visibility of scholarly content (Everinmene & Eze, 2021; Graaf, 2023). However, Akuffo and Budu (2019) caution that without adequate training and user support, the level of utilization may remain suboptimal. The level of use of electronic information resources is not only a function of availability but also of users' skills, infrastructural capacity, and the effectiveness of institutional policies supporting ICT integration.

The impact of ICT application on the use of electronic resources is widely acknowledged as transformative, particularly in enhancing access, efficiency, and quality of academic research. ICT tools such as computers, internet connectivity, digital libraries, and online databases have significantly improved users' ability to locate, retrieve, and utilize scholarly information. Studies indicate that the integration of ICTs into academic environments has led to increased usage of e-resources, as users can conveniently access materials remotely and in real time. For instance, Ghadulwo (2022) and Kuper, Sakibu, and Arthur (2018) observe that ICT adoption has improved students' engagement with electronic resources by making information more accessible and easier to navigate. Similarly, Akinola et al. (2020) highlight that postgraduate student relies heavily on ICT-driven platforms such as e-journals and online databases for research, thereby enhancing the quality and timeliness of their academic work. This demonstrates that ICT application not only increases the frequency of e-resource use but also improves the overall learning and research experience. However, Abubakar and Adetimirin (2015) argue that computer literacy significantly determines how effectively users can exploit electronic resources, suggesting that low skill levels may limit the benefits of ICT integration. In addition, Abubakar et. al. (2017) emphasizes that inadequate ICT infrastructure, such as poor internet connectivity and limited access to devices, can reduce the positive impact of ICT on e-resource usage. Furthermore, Everinmene and Eze (2021) note that although digitization technologies improve the preservation and accessibility of academic content, challenges such as insufficient funding and technical expertise can hinder their sustainability. Graaf (2023) also points out that while open science and digital library services have expanded opportunities for collaboration and knowledge sharing, institutional and policy limitations may restrict their full implementation.

The use of electronic information resources in academic environments is often constrained by several interrelated challenges, particularly in developing contexts. One major issue is inadequate ICT infrastructure, including limited access to computers, insufficient bandwidth, and unstable internet connectivity. Studies indicate that even where e-resources are available, poor infrastructure significantly reduces their effective utilization. For instance, Kuper, Sakibu, and Arthur (2018) found that students experience difficulty accessing online databases due to unreliable internet services, while Ghadulwo (2022) reported that limited availability of ICT facilities restricts frequent use of electronic resources. In addition, inconsistent power supply remains a persistent barrier, especially in Nigerian institutions, disrupting access to digital platforms and discouraging continuous usage. These infrastructural challenges highlight the gap between the provision of electronic resources and their actual utilization in academic settings. Another critical challenge relates to users' digital literacy and institutional support systems. Abubakar and Adetimirin (2015) emphasize that low levels of computer literacy hinder users' ability to effectively search, evaluate, and utilize electronic information resources. Similarly, Abubakar, Gupiyem, and Banwar (2017) identify limited ICT skills and poor accessibility as key factors affecting e-resource usage among postgraduate students. Furthermore, issues such as lack of awareness, inadequate training programs, and insufficient user support services contribute to underutilization. Everinmene and Eze (2021) also note that challenges in digitization processes such as lack of technical expertise and funding affect the availability and sustainability of electronic resources. On a broader scale, Graaf (2023) points out that organizational and policy-related constraints, including weak implementation of open access initiatives, can limit the accessibility and

sharing of scholarly information. Therefore, while electronic resources offer significant academic benefits, their effective use is hindered by a combination of infrastructural, technical, and institutional challenges that require strategic intervention.

Methodology

The study adopted Quantitative research method and a descriptive survey design. The population of the study comprised all students of Katsina State Institute of Management Studies, numbering one thousand three hundred and five (1,305). A sample size of 378 respondents and proportionate stratified random sampling technique was employed. A questionnaire was used as the instrument for data collection and was validated by experts in the field of Library of Information Science. The reliability result of the instrument was 0.872. The data collected were analyzed using descriptive statistics, where mean and standard deviation were used, while SPSS version 23 was employed for the analysis.

Response Rate

A total of three hundred and seventy-eight (378) copies of the questionnaire were distributed to respondents in the KSTIM, and three hundred and five (305) copies were duly completed and returned. This represents a response rate (80.7%).

Table 1. Types of ICTs Applied in the Use of Electronic Resources

S/N	Statements	Mean	Standard deviation	Decision
1	Computers and laptops are widely used to access electronic resources.	2.20	.98	D
2	Smartphones are commonly used for accessing e-resources.	2.90	.88	D
3	Internet connectivity facilitates access to electronic information resources.	3.00	1.44	A
4	Library databases and OPAC are frequently used for information retrieval.	2.10	1.12	D
5	Institutional repositories are utilized for accessing academic materials	1.32	.47	D

(Strongly Agree – Agree – Neutral – Disagree – Strongly Disagree)

The finding indicated that respondents generally disagreed that most ICT tools such as computers and laptops (Mean = 2.20), smartphones (Mean = 2.90), library databases/OPAC (Mean = 2.10), and institutional repositories (Mean = 1.32) are widely used for accessing electronic resources. However, they agreed that internet connectivity facilitates access to electronic information resources (Mean = 3.00), suggesting it is the most recognized and utilized ICT support among the listed tools.

Table 2. Level of Use of Electronic Information Resources with ICTs

		NU		**RU**		**SWU**		**MU**		**EU**		**Mean**	**STD**
S/N	**Statement**	**F**	**%**	**F**	**%**	**F**	**%**	**F**	**%**	**F**	**%**		
1	I frequently use e-resources for academic assignments.	150	49.18	125	40.9	30	9.83	0	0	0	0	2.56	1.23
2	I use electronic journals for research purposes.	180	59.01	100	32.78	25	8.19	0	0	0	0	1.79	0.76
3	I use e-books regularly for my studies.	177	58.03	128	41.96	28	9.18	0	0	0	0	1.78	.81
4	I use online databases for academic information retrieval.	140	45.90	100	32.78	65	21.31	0	0	0	0	1.42	.61
5	I utilize e-resources on a daily basis	157	51.47	128	41.96	20	6.55	0	0	0	0	1.32	.47

(Not Use – Rarely use – Somewhat Use – Moderately Use – Extremely use)

The finding indicated that the level of use of electronic information resources among respondents is generally low, as reflected in their disagreement with all the statements. This includes infrequent use of e-resources for academic assignments (Mean = 2.56), electronic journals (Mean = 1.79), e-books (Mean = 1.78), online databases (Mean = 1.42), and daily utilization of e-resources (Mean = 1.32), showing limited engagement with ICT-based academic resources.

Discussion of the Findings

1. Identify the types of ICTs applied in the use of electronic resources in KSTIM, Katsina State. The results show a generally low level of utilization of ICT tools for accessing electronic resources, with internet connectivity being the only widely acknowledged facilitator. In line with the present finding that ICT utilization is generally low with internet connectivity being the main facilitator, Ghadulwo (2022) and Kuper et al. (2018) similarly reported limited use of ICT tools for accessing e-resources among students, while Abubakar et al. (2017) emphasized that ICT accessibility strongly influences usage, supporting the importance of internet as observed in this study. However, Graaf (2023) differs by highlighting advanced institutional ICT services in research libraries that enhance access to digital resources.

2. Ascertain the level of use of electronic information resources with the application of ICTs in the study area. The results reveal a generally poor level of utilization of electronic information resources for academic purposes among respondents. The present finding of poor utilization of electronic information resources aligns with Akuffo and Budu (2019) and Ghadulwo (2022), who also reported low usage levels among students in Ghana and Nigeria. Similarly, Kuper et al. (2018) found limited engagement with e-resources due to lack of awareness and skills. In contrast, Akinola et al. (2020) reported higher usage of electronic journals among postgraduate students, suggesting better utilization at advanced academic level

Summary of the Findings.

1. The study shows that the use of ICT tools for accessing electronic resources at KSTIM, Katsina State is generally low. Among the available ICT facilities, only internet connectivity is widely used and recognized as the main support for accessing e-resources.

This finding agrees with studies by Ghadulwo (2022) and Kuper et al. (2018), which also reported limited use of ICT tools among students. It also aligns with Abubakar et al. (2017), who found that access to ICT, especially the internet, strongly affects how often electronic resources are used.

However, it contrasts with Graaf (2023), who reported that some research libraries have advanced ICT systems that significantly improve access to digital resources.

2. The findings indicate that the level of use of electronic information resources through ICTs in the study area is generally poor. This shows that respondents make limited use of e-resources for academic activities.This result is consistent with Akuffo and Budu (2019) and Ghadulwo (2022), who also observed low usage levels among students in Ghana and Nigeria. It also agrees with Kuper et al. (2018), who linked low utilization to inadequate awareness and insufficient ICT skills.

However, the finding differs from Akinola et al. (2020), who reported higher use of electronic journals among postgraduate students, suggesting that utilization tends to improve at more advanced academic levels.

Conclusion

In conclusion, the study reveals that the application of ICTs for accessing electronic information resources in KSTIM, Katsina State is generally low, with internet connectivity being the only widely utilized and recognized tool. The level of use of electronic information resources is also poor, indicating limited engagement with ICT-based academic materials among respondents. Although ICT application has a positive influence on learning, particularly in information retrieval and independent study, its effectiveness in improving quality access and research efficiency remains limited. Furthermore, several challenges such as poor internet connectivity, inadequate ICT facilities, lack of ICT skills, irregular power supply, and insufficient training significantly hinder effective utilization of electronic information resources in the study area.

Recommendations

1.The institution should improve ICT infrastructure by providing adequate facilities and stable internet connectivity to enhance access to electronic resources. This can be achieved through increased budgetary allocation for ICT development, regular maintenance of existing facilities, installation of additional access points, and collaboration with internet service providers to ensure reliable and high-speed internet access for users. This will enhance access to and utilization of electronic resources for teaching, learning, and research.

2. Regular ICT training and capacity-building programmes should be organized to improve users' skills and increase the utilization of e-resources, Conducting periodic ICT literacy and e-resource utilization training programmes for students, academic staff, and researchers, Through workshops, seminars, hands-on training sessions, orientation programmes, online tutorials, and continuous user support services. Training schedules should be developed and implemented regularly, with practical demonstrations on accessing, searching, retrieving, and utilizing electronic resources for teaching, learning, and research purposes.

Abstract

This paper focuses on the utilization of robots in shelving maintenance in library operations. Libraries are an essential part of our communities, providing access to information, education and entertainment. However, keeping track of all the books and resources in a library can be a daunting task. Robotics technology can be used to automate routine tasks, such as inventory management and book retrieval, which can save time and reduce the workload of librarians. The paper provides categories of robotic designs such as; Mechanical construction, electrical components that powers and control the machinery and software. It also highlights historical background of robotics in library applications and the benefits of using shelf-reading robots in libraries. It also discusses the global reviews of Robots, functions and relevance of the applications of robots to shelf reading and maintenance. The paper gave challenges, conclusions and ways forward for using shelf-reading robots in libraries which includes; a need for training and retooling of library staff for improved library services and experiences for all patrons.

Key words: Robotics, Robotics operating system, Robotics designs, Robotic shelving and RFID

Introduction

Libraries are an essential part of our communities, providing access to information, education, and entertainment. However, keeping track of all the books and resources in a library can be a daunting task. This is where shelf-reading robots come in. These robots are designed to navigate the library shelves and scan for misplaced or misfiled books, making it easier for librarians to keep the collection organized and up-to-date. The integration of robotics in libraries is an emerging trend that has gained attention from scholars and practitioners alike.

According to a study by Malpica et al (2019), robotics technology can be used to automate routine tasks, such as inventory management and book retrieval, which can save time and reduce the workload of librarians. For example, robotic assistants can help patrons locate books and provide

recommendations based on their reading history, as suggested by Doherty & Edmonds (2020). But the question remains: does the functionality of shelf-reading robots justify their cost and implementation in library operations. Libraries in universities are essential agents that develop, organize, provide easy access to and preserve materials to meet the needs of students and scholars.

The inspiration behind inventing a library shelf-reading robot was to automate and expedite the time-consuming manual checking of the accuracy and organization of the library bookshelves. The ground-breaking idea was to create a robot that could efficiently scan library shelves, and detect misplaced or misfiled books, whilst allow librarians to focus on customer-facing initiatives that will continue to improve the overall efficiency of the library operation, much to the convenience and benefit of its significant student community. *(Savastano e al., 2022).*

Robotics is the interdisciplinary study and practice of the design, construction, operation, and use of robots. The goal of most robotics is to design machines that can help and assist humans. Many robots are built to do jobs that are hazardous to people, such as finding survivors in unstable ruins, and exploring space, mines and shipwrecks. Others replace people in jobs that are boring, repetitive, or unpleasant, such as cleaning, monitoring, transporting, and assembling. Today, robotics is a rapidly growing field, as technological advances continue; researching, designing, and building new robots serve various practical purposes. It is a branch of technology that deals with the design, construction, operation, and application of robots. In the context of libraries, robotics refers to automated machines used to perform tasks like sorting, shelving, and assisting users. (Kilian et al., 2022).

Some of the larger libraries around the world already have automated storage and retrieval systems (ASRS). This, for instance, applies to the Joe and Rika Mansueto Library at the University of Chicago that introduced an ASRS capable

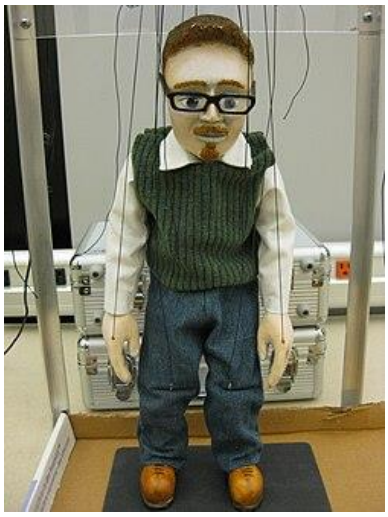
of shelving 3.5 million volumes underground by size rather than classification, and the Bodleian Libraries' book storage facility at the University of Oxford using an ASRS holding 8 million items (University of Chicago, 2022). In a world that produces 2.5 quintillion bytes of data every day according to IBM consumer Products1, vast amounts of information and consequently huge quantities of printed material are produced every single day. Automated library systems come in handy as part of manageable logistics solutions at larger libraries, whether the materials to be handled are books, or collections.

The evolving role of libraries in the digital age demands constant innovation to meet the increasing needs of students, researchers, and faculty. Robotics, an area that has seen exponential growth in other sectors, is now finding its way into academic libraries. These robotic systems are designed to streamline library functions by automating tasks that were previously performed manually, such as sorting, shelving, cataloging, and even user assistance. *(Raji 2024).*

Categories of Robotics Designs

Robotics usually combines three aspects of design work to create robot systems. The followings are the categories of robotics designs.

1. Mechanical construction: a frame, form or shape designed to achieve a particular task. For example, a robot designed to travel across heavy dirt or mud might use caterpillar tracks. Origami inspired robots can sense and analyze in extreme environments. The mechanical aspect of the robot is mostly the creator's solution to completing the assigned task and dealing with the physics of the environment around it. Form follows function.
2. Electrical components that power and control the machinery. For example, the robot with caterpillar tracks would need some kind of power to move the tracker treads. That power comes in the form of electricity, which will have to travel through a wire and originate from a battery, a basic electrical circuit. Even petrol powered machines that get their power mainly from petrol still require an electric current to start the combustion process which is why most petrol-powered machines like cars, have batteries. The electrical aspect of robots is used for movement (through motors), sensing (where electrical signals are used to measure things like heat, sound, position, and energy status), and operation (robots need some level of electrical energy supplied to their motors and sensors in order to activate and perform basic operations)
3. Software: A program is how a robot decides when or how to do something. In the caterpillar track example, a robot that needs to move across a muddy road may have the correct mechanical construction and receive the correct amount of power from its battery, but would not be able to go anywhere without a program telling it to move. Programs are the core essence of a robot, it could have excellent mechanical and electrical construction, but if its program is poorly structured, its performance will be very poor (or it may not perform at all). There are three different types of robotic programs: remote control, artificial intelligence, and hybrid.
4. A robot with remote control_programming has a preexisting set of commands that it will only perform if and when it receives a signal from a control source, typically a human being with remote control. It is perhaps more appropriate to view devices controlled primarily by human commands as falling in the discipline of automation rather than robotics. Robots that use artificial intelligence interact with their environment on their own without a control source, and can determine reactions to objects and problems they encounter using their preexisting programming. A hybrid is a form of programming that incorporates both AI and RC functions in them.



Pupet Magnus

A robot- Manipulated Marionette with complex control systems

To find out whether a robot could provide valuable assistance at any given library, one would have to initially look at the different routines and tasks at the library in question and break every library task down into simple movements, or operations that a robot with the current technology would be expected to be able to execute. The handling and circulation of materials is one thing. But there are many other traditional librarian tasks to consider like the acquisition of materials that are to be cataloged, classification of materials, replacement of materials to more modern ones as part of the overall maintenance, and bibliographical support of researchers and students to name a few. Some academic libraries also provide bibliometric analyses at multiple levels and guidance on how to achieve scientific impact (Joe, 2020)

Robot Operating System

A robot operating system (ROS) facilitates robotics development by providing tools, libraries, and communication structures for modular applications. The robot operating system simplifies and accelerates robotics software development by providing a framework for building modular, distributed, and reusable code. Its open-source nature, extensive community support, and diverse set of tools make it an indispensable tool for both beginners and experts in robotics. While its technicalities might seem intricate at first glance, ROS essentially acts as a facilitator, allowing developers to focus on innovating and creating advanced robotic systems without getting bogged down by low-level intricacies (Johnson, 2020)

Additionally, ROS features a package management system that organizes and shares code among users. Users can create and distribute packages containing libraries, algorithms, drivers, or complete applications. This fosters collaboration within the robotics community as developers can leverage existing packages and contribute their own, accelerating the development process. Moreover, the robot operating system is highly adaptable and can be employed in various robotic applications, ranging from industrial robots and autonomous vehicles to drones and household robots. Its flexibility and scalability make it a preferred choice for both research and commercial projects in robotics.

Robot Operating System Applications

The followings are the various robot operating systems applications.

1. **Autonomous vehicles and drones:**

Self-driving cars: ROS is extensively used in autonomous vehicle research and development. It enables sensor data integration (LiDAR, cameras, and GPS) for perception, decision-making algorithms, and control systems. For instance, teams participating in the Defense Advanced Research Projects Agency (DARPA) Urban Challenge used ROS to develop self-driving cars capable of navigating urban environments autonomously.

2. **Industrial robotics**

Robotic arms in manufacturing: ROS facilitates the development of industrial robots for tasks such as pick-and-place, assembly, and welding. It helps coordinate robotic arm movements, integrate sensors for object detection, and interface with machinery. Universal Robots, a leading industrial robot manufacturer, utilizes ROS to program and control its robotic arms.

3. **Humanoid robots**

Humanoid robot navigation: ROS enables the creation of humanoid robots capable of performing various tasks. It assists in implementing algorithms for navigation, object recognition, grasping, and interacting with the environment. The HRP-4C robot developed by AIST in Japan used ROS for its control system and high-level functionalities (Allen, 2024)

4. **Research and education**

Robotics research platforms: ROS serves as a fundamental tool in robotics research and education. It provides a standardized framework for experimenting with algorithms, testing new concepts, and teaching robotics concepts. Many universities and research institutions worldwide utilize ROS in their robotics courses and experiments due to its accessibility and versatility.

In each of these applications, ROS serves as a unifying platform that simplifies the development and deployment of complex robotic systems. It offers a standardized framework for integrating sensors, implementing algorithms, controlling actuators, and managing the overall functionality of robots, regardless of the application domain.

Benefits of Robot Operating System

ROS offers several key benefits contributing to its popularity and widespread adoption in robotics. Here are some of the key advantages, along with examples illustrating these benefits:

1**. Modularity and reusability**: This modularity allows developers to re-use code, reducing development time and effort.

2. **Open-source nature:** A robotics startup working on autonomous delivery robots can leverage ROS's open-source libraries and tools without incurring substantial software development costs. By utilizing ROS, they can access a vast community-contributed codebase, accelerating their development process and enabling rapid prototyping.

3. **Distributed computing architecture**

In the context of a robotic swarm, each robot can run ROS nodes communicating with one another. These nodes might exchange information about the environment, facilitating collaborative decision-making. For instance, a swarm of drones coordinating their flight paths to cover an area efficiently demonstrates the advantages of ROS's distributed architecture.

4. **Hardware abstraction**

A robotics company developing a robotic arm can use ROS to interface with various sensors and actuators without being concerned about specific hardware details. This abstraction simplifies the development process, allowing the company to focus on higher-level functionalities rather than low-level hardware integration.

5. **Educational value:** Universities offering robotics courses leverage ROS to teach students fundamental concepts in robotics. Students can experiment with different robotic systems, learn about ROS's architecture, and gain practical experience through simulations and hands-on projects, preparing them for real-world applications.

6. **Integration with various robotics hardware:** Using ROS, a robotics enthusiast building a DIY robot can easily integrate various off-the-shelf sensors, actuators, and motor controllers into the project. The availability of ROS drivers and libraries for a wide range of hardware components streamlines the integration process (German National Library, 2020)

Historical Background of Robotics in Library Applications

The use of robotics in libraries began in the late 20th century when automated systems for cataloging and sorting materials were first introduced. Over the years, advancements in robotics technology have expanded the role of robots in libraries, particularly in developed countries. Early examples include robotic arms used for sorting materials and automatic check-in/check-out systems. In the 2000s, more sophisticated robots, such as those used for inventory management and user interaction, began to be deployed in academic libraries. The integration of robotics into academic libraries represents a significant shift in how information is accessed, organized, and delivered. Over time, technological advancements have transformed libraries from traditional book repositories into dynamic information hubs. Robotics has played a crucial role in enhancing operational efficiency, improving user experiences, and redefining library services (Allen, 2022)

Benefits of Robotics in Library Services

Robotics can enhance the learning experience by providing interactive exhibits and activities

that promote STEM (Science, Technology, Engineering, and Math) education. Chen & Pan, (2019) noted that such interactive exhibits can be effective in engaging children and youth, who may be more motivated to learn through interactive and hands-on experiences. Stock takes, that identify books that need to be replaced or re-ordered can now be carried out more frequently, thereby maintaining the library's full book collection. The shelf-reading robot can also be used to improve quality control issues as it will automatically identify missing or misplaced items (Davis, 2020)

Benefits of using Robots in Shelf-reading in Libraries

Below are the highlighted benefits of Shelf-reading robots in libraries;

1. **Increased Efficiency**: Traditionally, shelf-reading has been a time-consuming and labor-intensive task for librarians. By automating this process with robots, libraries can save significant amounts of time and resources. Shelf-reading robots can scan and analyze library shelves for misplaced books and other errors in shelving, identifying the areas that require attention and making it easier for librarians to fix these issues.

2. **Improved Accuracy**: Shelf-reading robots can help to improve the accuracy of the library catalogue by identifying misplaced books and other errors in shelving. By ensuring that books are properly shelved and easy to locate, shelf-reading robots can help to improve the accessibility and usability of library collections.

3. **Enhanced User Experience**: By ensuring that books are properly shelved and easy to locate, shelf-reading robots can help to improve the overall user experience for patrons. This can be especially important for patrons with limited mobility or other disabilities who may find it challenging to physically search through shelves.

4. **Cost Savings**: Automating shelf-reading with robots can save libraries significant amounts of time and resources, which can translate into cost savings. While the initial investment in shelf-reading robots may be significant, the long-term cost savings can be substantial.

Global Overview of Shelf-Reading Robots in Libraries

With the use of technology like RFID, computer vision, and artificial intelligence, shelf-reading

robots have become a necessary component of contemporary libraries all over the world. They automate shelf audits, find lost objects, and maintain precise organization. These robots have been adopted by libraries all around the world, from Singapore and China to the United States and Sweden, to increase productivity, decrease manual labour, and improve collection management. Regular maintenance, staff training, integration with library management systems, data analysis for informed decision-making, expert collaboration in development, incorporating user feedback, accessibility concerns, and ongoing innovation are all examples of best practices. These robots are essential to the way library services are developing because they promote environmentally friendly behaviours and enhance the user experience in general.

Library holdings are only useful if they're findable. For print collections at least, even recommending the most relevant titles ultimately falls short if they're not on the right shelf. However, the process of finding out if things have been properly shelved is time-consuming and never ending, as materials are continuously moved even if they don't circulate outside the building. The task is often handled by support staff, interns, or volunteers, but Singapore's National Library Board has a new alternative: a library robot, developed by researchers at the Infocom research branch of Singapore's Agency for Science, Technology and Research (Indraji & Satishkumar, 2024). Library holdings are only useful if they are findable. While many libraries focus on the digital aspects of improving search, for print collections at least, even recommending the most relevant titles ultimately falls short if they are not on the right shelf. Misfiled materials can lead to major controversies, such as the one that recently led to the resignation of former Boston Public Library President Amy Ryan, as well as that staple of library human interest stories, the rare book or manuscript "discovered" in a library or archive (Frazier & Park, 2021)

Global Trends and Future Prospects

The adoption of robotics in academic libraries is expected to continue growing, driven by advancements in AI, machine learning, and IoT (Internet of Things). Future trends include; Collaborative Robots (Cobots): This is designed to work alongside humans, enhancing productivity without replacing staff. Autonomous Navigation: Robots capable of navigating complex environments without human intervention. AI-Driven Personalization: Tailored recommendations and adaptive learning environments based on user preferences. Emerging examples include: Beijing Institute of Technology Library (China): Developing robots with advanced facial recognition and NLP capabilities to provide personalized services. European Union's Robotics in Libraries Initiative: Exploring collaborative projects to standardize robotics integration across academic institutions. **(**Prodhani, 2016)

How Robotics Operating System Works

Understanding how the robot operating system works involves delving into its core concepts and the step-by-step processes it employs. Here's a breakdown of the workings of ROS into key technical steps:

Node creation: The foundation of ROS lies in its nodes, which are individual processes responsible for specific tasks. Developers create these nodes using ROS libraries in languages such as C++ or Python. Each node typically performs a particular function, such as controlling a sensor, processing data, or executing algorithms.

Communication via topics: Nodes communicate with each other using a pub-sub model through topics. Topics are named buses, where nodes can publish messages (publishers) or subscribe to receive messages (subscribers). For instance, a camera node might publish images to a 'camera' topic, while an image processing node subscribes to this topic to receive and process the images (Wright & Patel, 2020)

Functions of Robots in Shelf Maintenance

The Shelf-reading robot autonomously scans the book shelves after the library closes and detects the RFID tags embedded in the books. The system uses a self-localization algorithm to analyse the digital data collected against the library's collection database to identify miss - sequenced books, missing books, and books that belong to other libraries. This removes the need for full-library shelf reading as library staff need only attend to the mis-shelved books, which is about 5% of the library collection. Most importantly, it addresses the perennial customer complaint of not able to locate a book in the library. The item locations collected from the daily scan are integrated with the library catalogue. This enables customers to self-help and locate the library books faster without the need to understand the library shelving

standards, e.g. the Dewey Decimal Classification system. The Autor sorter processes books returned at the book drop and facilitates the automatic sorting of the returned items into bins based on pre-defined categories (Vijayi, 2024)

Manual intervention is required only for exception items, which is about 1% of the returned items. This has improved productivity, and achieved a high level of accuracy in terms of the returned items being sorted. Using analysis results of past loan records, the autosorter also identifies popular items for library staff to place at "Just Returned" shelves at the entrance of the library so that library users can easily locate them. The autonomous robot is able to carry a large volume of items (about 2000 books per day) and transports them back to the sorting room. The system improves productivity and eliminates the need for staff to spend time walking across the library to collect the items. It also enhances workplace safety by reducing the need for staff to carry heavy items across long distances (Wright & Patel, (2020)

Challenges with Robot's Implementation

1. One of the major concerns is the cost of implementing and maintaining robotics technology, which may be a barrier for smaller libraries with limited budgets.
2. Robot may need to be enhanced with more proximity sensors and re-programmed to handle new situations or environments. In addition, robots need to be serviced regularly to ensure optimal performance.
3. There is a need to modify the environment to be robot-friendly. Site survey and preparation is crucial to ensure a successful deployment. This includes removal of obstacles in the robot navigation path, reconfiguration of shelves and appropriate positioning of books. Robots can throw tantrums too Robots are best doing what they are programmed to do.

Conclusion

The application of robot technology in shelving maintenance in a library for improved services may be furthered by inherent library needs, local/national and international trends, patron demands, and staff/management demands. Currently, libraries with positive attitudes to new technologies and even prior experience with robotics seem to be inclined to invest in robots that could autonomously navigate, locate and place books on information desks which assist in the education of students and the patrons. Obstacles towards the application of robotic proved to be fearful among the library staff of being gradually replaced by robots, an unsatisfying level of robotic functionality and/or a simple reluctance to apply and implement new and advanced library task solutions that in turn would demand retraining and retooling the library staff and perhaps even an organizational restructuring. The general lack of resources (staff time, money, space) would present an obstacle, as well as the cost of maintaining the patron's enthusiasm with robots in the long term.

Way forward

1. Cost-Efficiency Solutions: Libraries should explore funding opportunities or partnerships to reduce the initial investment required for robotics.

2. Staff Training: Providing comprehensive training programs for library staff can ease the transition to robotics and help overcome resistance.

3. Gradual Implementation: Libraries should consider a phased implementation of robotics, starting with small-scale automation projects before expanding. 4. User Education: Libraries should offer workshops and resources to educate users on how robotics can improve their experience.

Abstract

The growing integration of artificial intelligence (AI) into library operations has created opportunities for improving information service delivery through enhanced information retrieval, personalized user support, and service efficiency. Despite increasing global adoption, evidence suggests that AI implementation in many Nigerian university libraries remains limited. This study investigated the application of AI in information service delivery in selected university libraries in Abia State, Nigeria. Specifically, the study examined the pattern of AI tool use, the extent of AI application in major service areas, librarians' perceptions of AI adoption, barriers affecting implementation, and strategies for strengthening AI-supported information service delivery. A descriptive cross-sectional survey design was adopted. The population comprised 86 professional and para-professional library personnel drawn from Abia State University Library, Michael Okpara University of Agriculture Library, and Clifford University Library. A census approach was employed, and 75 valid responses were obtained, representing an 87.2% response rate. Data were collected using a structured questionnaire and analyzed using frequency counts, percentages, mean scores, and standard deviations. The findings revealed that AI adoption in the selected university libraries remains low, with most respondents reporting little or no use of AI tools. AI application was found to be concentrated primarily in information retrieval and search services, while adoption in cataloguing, reference, and user service delivery remained limited. Respondents, however, expressed highly positive perceptions of AI and acknowledged its potential to improve efficiency, service quality, and user satisfaction. Major barriers identified were inadequate funding, poor ICT infrastructure, and limited institutional support. The study concludes that AI adoption in the selected university libraries is constrained more by organizational and infrastructural factors than by librarians' attitudes toward the technology. The study recommends strategic investment in ICT infrastructure, continuous staff capacity development, dedicated funding mechanisms, institutional AI policies, and phased implementation of AI-enabled library services.

Keywords: *Artificial intelligence, information service delivery, university libraries, AI adoption, academic libraries, Nigeria.*

Introduction

University libraries are increasingly adopting digital technologies to improve information service delivery and respond to changing patterns of teaching, learning, and research. Among these technologies, artificial intelligence (AI) has emerged as a significant innovation with the potential to enhance information discovery, automate routine processes, personalize user support, and improve access to information resources (Das & Islam, 2021). In library and information science, AI encompasses technologies such as chatbots, recommendation systems, intelligent search tools, automated cataloguing, and metadata generation systems that support the delivery of information services.

Information service delivery remains a core function of university libraries and involves providing users with timely, relevant, and accessible information to support academic and research activities. As user expectations become increasingly shaped by digital environments, libraries are under pressure to deliver services that are more efficient, responsive, and user-centred. Consequently, AI is increasingly viewed as a strategic tool for improving service quality and operational efficiency (Cox, 2023).

Globally, academic libraries have begun integrating AI into reference services, information retrieval, collection management, and user support. However, debates persist regarding the extent of AI adoption, its impact on service delivery, ethical concerns, staff preparedness, and infrastructural requirements (Cox, 2023). Evidence from low- and middle-income countries suggests that while awareness of AI is growing, implementation remains constrained by funding limitations, inadequate infrastructure, policy gaps, and shortages of relevant technical skills (Nakaziba et al., 2026).

In Nigeria, discussions on AI in libraries have increased, yet evidence of widespread operational adoption remains limited. Existing studies have focused largely on awareness, opportunities, and challenges, with less attention given to how AI is actually applied in library services and the factors influencing its effectiveness. In Abia State, where university libraries are expected to support teaching, learning, and research in an increasingly digital environment, there is limited empirical evidence regarding the AI tools currently in use, the extent of their application in information service delivery, librarians' perceptions of their usefulness, and the barriers affecting implementation. Understanding these issues is important because the effectiveness of AI-supported information service delivery depends not only on the availability of AI technologies but also on how extensively they are used, how they are perceived by librarians, and the institutional conditions that support or constrain their adoption.

Against this background, this study examines the application of artificial intelligence in selected university libraries in Abia State and its implications for information service delivery.

Statement of the Problem

Artificial intelligence has the potential to improve information service delivery in university libraries through enhanced information discovery, personalized user support, and greater operational efficiency. Consequently, university libraries are increasingly expected to integrate AI technologies into their services to meet the evolving needs of users in digital learning environments.

Despite growing awareness of AI in Nigerian academic libraries, evidence suggests that operational adoption remains limited and uneven due to infrastructural deficiencies, inadequate funding, insufficient technical expertise, weak institutional support, and the absence of clear implementation policies (Afolayan, 2022; Igbo et al., 2024). While librarians may recognize the potential value of AI, positive perception does not necessarily translate into effective adoption and application.

In university libraries in Abia State, little empirical evidence exists regarding the AI tools currently in use, the extent of their application in information service delivery, librarians' perceptions of AI adoption, and the institutional barriers affecting implementation. Consequently, it remains unclear how these factors influence the application of AI for information service delivery. This knowledge gap limits evidence-based decisions on strategies required to enhance AI adoption and strengthen information service delivery in university libraries within the state.

Recent scholarship suggests that the successful application of AI in university libraries depends not only on the availability of AI tools but also on librarians' acceptance of such technologies and the institutional conditions supporting their adoption. Studies consistently identify perceived usefulness, staff capability, infrastructure, funding, organizational support, and policy frameworks as important factors influencing AI implementation (Cox, 2023; Nakaziba et al., 2026). These factors reflect the assumptions of the Technology Acceptance Model (TAM) and Diffusion of Innovation (DOI) theory, which explain how technological innovations are perceived, adopted, and sustained within organizations. Understanding AI application in university libraries therefore requires attention not only to the technologies themselves but also to librarians' perceptions and the institutional environment within which adoption occurs.

Objectives of the Study

The main objective of this study is to examine the application of artificial intelligence and its implications for information service delivery in selected university libraries in Abia State.

The specific objectives are to:

1. Identify the artificial intelligence tools currently used in information service delivery in the selected university libraries.
2. Determine the extent of artificial intelligence application in information service delivery in the selected university libraries.
3. Examine librarians' perceptions of the contribution of artificial intelligence to information service delivery.
4. Identify the barriers affecting the effective application of artificial intelligence in information service delivery in the selected university libraries.
5. Determine strategies for enhancing the application of artificial intelligence for improved information service delivery in the selected university libraries.

Literature Review

The integration of artificial intelligence (AI) into university library services has become a significant area of scholarly inquiry as libraries respond to rapid digital transformation, changing user expectations, and the growing complexity of information environments. Recent literature increasingly positions AI not merely as a technological innovation but as a strategic enabler of information service delivery capable of transforming information discovery, access, organization, and user engagement (Cox, 2023; Cox & Wang, 2025). However, emerging evidence also suggests that successful AI implementation depends on a combination of technological, organizational, and human factors. This review synthesizes contemporary literature around five interconnected themes aligned with the objectives of the study: AI tools used in university libraries, the extent of AI application in information service delivery, librarians' perceptions of AI adoption, barriers to implementation, and strategies for enhancing AI-supported information service delivery.

Artificial Intelligence and Information Service Delivery in University Libraries

Artificial intelligence refers to computational systems capable of performing tasks that traditionally require human intelligence, including learning, reasoning, decision-making, pattern recognition, and natural language processing. Within library and information science, AI encompasses a range of technologies such as machine learning algorithms, expert systems, recommender systems, chatbots, intelligent search engines, robotics, automated classification tools, and generative AI applications (Das & Islam, 2021).

The growing relevance of AI in libraries is closely linked to information service delivery, which remains one of the fundamental functions of university libraries. Information service delivery involves the processes through which

libraries connect users with information resources and provide support for teaching, learning, and research activities. These services include reference assistance, information literacy instruction, current awareness services, circulation, resource discovery, research consultations, and digital access services. As academic libraries increasingly operate within digital and hybrid information environments, the effectiveness of service delivery depends on the ability to provide timely, accurate, personalized, and user-centred access to information resources (Parsons-Diamond, 2026).

Recent scholarship argues that AI has the capacity to reshape virtually every stage of information service delivery. AI-driven systems can improve search precision, automate routine inquiries, support multilingual interactions, personalize recommendations, and provide continuous virtual assistance. Cox (2023) contends that AI should be viewed not only as a service-enhancement technology but also as a transformative force capable of redefining library work, professional competencies, and organizational structures. Consequently, contemporary discussions increasingly focus on how AI can be integrated responsibly and effectively into information service ecosystems rather than whether it should be adopted.

AI Tools Used in University Libraries

The range of AI technologies currently deployed in academic libraries continues to expand. Ayinde et al. (2026) identify six major domains of AI application in higher education libraries: technical services, reference and information services, collection development, administration, user education, and professional development. Across these domains, AI tools are being used to automate metadata generation, support cataloguing and classification, improve resource discovery, facilitate virtual reference services, and enhance decision-making processes.

Similarly, Nakaziba et al. (2026) identified chatbots, RFID-enabled systems, robotics, facial recognition technologies, intelligent search systems, and generative AI applications as the most frequently reported AI tools in academic libraries across low- and middle-income countries. Chatbots, in particular, have gained prominence because of their ability to provide real-time responses to routine user inquiries and extend service availability beyond conventional library hours. The emergence of generative AI has further accelerated interest in AI-supported library services. Hamad and Shehata (2025) found that GPT-based technologies can significantly enhance information retrieval, research support, and user engagement by facilitating conversational interactions with information systems. However, while AI tools are increasingly available, evidence suggests substantial disparities in adoption across institutions and regions. The presence of AI technologies does not necessarily indicate meaningful integration into information service delivery, particularly in developing-country contexts where implementation often remains experimental or fragmented.

Extent of AI Application in Information Service Delivery

Although awareness of AI has increased considerably, the extent of operational application remains uneven. Existing literature suggests that AI adoption tends to occur first in service areas where benefits are immediately visible to users, particularly information retrieval, virtual reference, and user support services.

Ayinde et al. (2026) observed that reference and information services constitute the most frequently reported area of AI application in academic libraries. AI-powered discovery systems and recommendation engines have become attractive because they directly improve users' ability to locate relevant information resources. Similarly, Hamad and Shehata (2025) reported that generative AI tools are increasingly being used to enhance information access and support research-related inquiries.

However, studies consistently show that implementation remains partial rather than comprehensive. Gmiterek and Kotuła (2025), studying public university libraries in Poland, found widespread institutional interest in generative AI but relatively moderate levels of operational utilization. Nakaziba et al. (2026) similarly concluded that AI implementation in many developing countries remains concentrated in isolated service functions rather than integrated across the full spectrum of library operations.

This pattern suggests that awareness and experimentation are advancing more rapidly than institutionalized adoption. Consequently, assessing the extent of AI application within specific university library contexts remains essential for understanding its actual contribution to information service delivery.

Librarians' Perceptions of AI Adoption

The success of technological innovations is strongly influenced by the perceptions of intended users. The Technology Acceptance Model (TAM) posits that perceived usefulness and perceived ease of use significantly influence technology adoption decisions. This perspective has become increasingly relevant in studies examining AI adoption among library professionals.

Several studies report generally positive attitudes toward AI within academic libraries. Ajani et al. (2022) found that Nigerian librarians demonstrated substantial awareness of AI technologies and acknowledged their potential to improve library services. Likewise, Çakmak and Eroğlu (2025) reported that university library administrators viewed AI as an important mechanism for enhancing service efficiency, operational effectiveness, and institutional competitiveness.

Nevertheless, positive perception alone does not guarantee successful implementation. Fagbola and Egbebi (2025) found that although librarians expressed favourable attitudes toward AI, actual adoption remained limited due to infrastructural deficiencies and inadequate organizational support. Similar findings have been reported across other developing

contexts, where enthusiasm for AI often exceeds institutional capacity to implement it effectively. These findings support the argument that perceptions are necessary but insufficient conditions for sustained adoption.

Barriers Affecting AI Application in Information Service Delivery

A recurring theme in contemporary literature is the existence of substantial barriers to AI adoption in academic libraries. These barriers are technological, organizational, financial, ethical, and human in nature. Infrastructure deficiencies remain among the most frequently cited constraints. Nakaziba et al. (2026) identified inadequate ICT infrastructure, unreliable internet connectivity, and insufficient technological resources as major obstacles to implementation in low- and middle-income countries. Financial limitations similarly affect the acquisition, maintenance, and upgrading of AI systems.

Human capacity issues also feature prominently. Cox and Wang (2025) argue that the increasing complexity of AI systems requires new competencies among library professionals, including data literacy, algorithmic awareness, AI evaluation skills, and ethical decision-making capabilities. However, many institutions lack sufficient opportunities for staff training and professional development. Ethical and governance concerns have emerged as additional barriers. The International Federation of Library Associations and Institutions (IFLA, 2024) highlights concerns relating to privacy, transparency, algorithmic bias, accountability, intellectual freedom, and inclusivity. These concerns are particularly important because libraries have longstanding commitments to equitable access to information and user confidentiality.

The literature therefore indicates that AI adoption is not merely a technological challenge but a multidimensional organizational issue requiring institutional readiness, governance structures, and sustainable resource commitments.

Strategies for Enhancing AI-Supported Information Service Delivery

Given the challenges associated with AI adoption, recent studies increasingly focus on implementation strategies rather than technological possibilities alone. Danquah et al. (2024) argue that successful AI integration requires strategic planning, institutional commitment, sustainable funding mechanisms, and continuous assessment of implementation outcomes. Professional development is consistently identified as a critical requirement. The Association of College and Research Libraries (ACRL, 2025) proposes a competency framework emphasizing ethical awareness, technical literacy, analytical skills, and practical application capabilities. Similarly, Cox and Wang (2025) advocate systematic AI literacy programmes to prepare library professionals for emerging technological responsibilities.

Institutional policies and governance frameworks have also become increasingly important. IFLA (2024) recommends the development of clear policies addressing ethical use, accountability, privacy protection, transparency, and responsible deployment of AI systems. Furthermore, studies suggest that collaborative partnerships among universities, technology providers, and professional associations can facilitate knowledge sharing and resource mobilization. Collectively, the literature indicates that sustainable AI implementation requires a combination of technological investment, human capacity development, policy support, ethical governance, and organizational commitment.

Theoretical Foundation

This study is anchored on the Technology Acceptance Model (TAM) and Diffusion of Innovation (DOI) Theory. TAM provides a useful framework for understanding librarians' perceptions of AI by explaining how perceived usefulness and perceived ease of use influence technology acceptance and utilization. The theory is particularly relevant to the study objective examining librarians' perceptions of AI-supported information service delivery.

DOI Theory complements TAM by explaining how innovations are adopted and diffused within organizational settings. The theory emphasizes factors such as compatibility, trialability, observability, organizational readiness, and resource availability. DOI therefore provides a useful lens for understanding variations in the extent of AI application, barriers to adoption, and strategies for implementation in university libraries. Together, the two theories provide a comprehensive explanation of how individual perceptions and organizational conditions interact to shape AI adoption and application in information service delivery.

The reviewed literature demonstrates that AI is increasingly transforming information service delivery in university libraries through applications in information retrieval, virtual reference services, resource discovery, and user support. However, the evidence also reveals that successful implementation depends on multiple interrelated factors, including the types of AI tools available, the extent of their application, librarians' perceptions, institutional readiness, funding, infrastructure, policy frameworks, and staff capability.

A consistent finding across the literature is that positive attitudes toward AI do not automatically translate into effective implementation. Rather, organizational preparedness and enabling institutional conditions largely determine whether AI technologies become embedded in library service delivery. Although these issues have received growing attention globally, there remains limited empirical evidence from Nigerian university libraries, particularly within Abia State. Specifically, little is known about the AI tools currently in use, the extent of their application in information service delivery, librarians' perceptions, barriers affecting implementation, and strategies required to strengthen adoption. This study addresses that gap by providing context-specific evidence from selected university libraries in Abia State.

Methodology

This study adopted a descriptive cross-sectional survey design to examine the application of artificial intelligence (AI) in information service delivery in selected university libraries in Abia State, Nigeria. The study was conducted in three university libraries representing the major ownership categories of universities in Nigeria: Abia State University Library (state-owned), Michael Okpara University of Agriculture Library (federal-owned), and Clifford University Library (private-owned).

The population comprised 86 professional and para-professional library personnel in the selected university libraries. Given the manageable size of the population, a census approach was adopted. Data were collected using a structured questionnaire developed from the study objectives, relevant literature, and the underlying assumptions of the Technology Acceptance Model (TAM) and Diffusion of Innovation (DOI) Theory. The instrument contained items on AI tools used in information service delivery, extent of AI application, librarians' perceptions of AI adoption, barriers to implementation, and strategies for enhancing AI-supported information service delivery.

The questionnaire was subjected to face and content validation by experts in Library and Information Science and research methodology. A pilot study was conducted to ascertain the clarity and suitability of the instrument before the main survey. Of the 86 questionnaires administered, 75 were properly completed and returned, yielding a response rate of 87.2%.

Data were analyzed using descriptive statistics, including frequency counts, percentages, mean scores, and standard deviations. These statistics were used to describe the pattern of AI use, assess the extent of AI application, examine librarians' perceptions, identify implementation barriers, and determine strategies for improving AI-supported information service delivery in the selected university libraries.

Results and Discussion

The findings are presented according to the research questions and objectives of the study.

Research Question 1: What is the pattern of AI tool use in the selected university libraries?

Table 1 Present Pattern of AI Use Among Respondents.

Category	Frequency	Percentage
No use of AI tools	50	66.67
Use of AI tools	19	25.33
Use of multiple or advanced AI tools	6	8.00
Total	**75**	**100.00**

Source: Field survey data, 2026.

Table 1 shows that AI use in the selected university libraries remains limited. Of the 75 respondents, 50 (66.7%) indicated that AI tools were not being used in their libraries, while only 19 (25.3%) reported the use of AI tools. A further 6 respondents (8.0%) indicated the use of multiple or relatively advanced AI applications.

The finding indicates that AI adoption in the selected university libraries is still at an early stage. Although AI technologies are increasingly discussed within the library profession, their practical deployment remains limited across the studied institutions. The dominance of the "no use" category suggests that AI has not yet become an integral component of routine library operations and service delivery.

This finding supports Ajani et al. (2022), who reported growing awareness of AI among Nigerian librarians but limited institutional readiness for implementation. Similarly, Nakaziba et al. (2026) observed that AI adoption in many low- and middle-income countries remains uneven and often confined to isolated applications. The finding suggests that the selected university libraries are still within the introductory phase of AI adoption, characterized by awareness and experimentation rather than widespread operational integration. AI adoption in the selected university libraries remains low, indicating that AI has not yet been institutionalized as a core component of information service delivery.

Research Question 2: To what extent is AI applied in major information service areas in the selected university libraries?

Table 2 Presents the Extent of AI Application Across Major Library Service Areas.

Service area	High extent n (%)	Low extent n (%)	Mean	SD
Cataloguing and classification	6 (8.00)	69 (92.00)	0.73	0.60
Reference services	6 (8.00)	69 (92.00)	0.57	0.64
User service delivery	6 (8.00)	69 (92.00)	0.65	0.63
Information retrieval/search	49 (65.33)	26 (34.67)	1.31	0.96

Source: Field survey data, 2026.

The results reveal that AI application is generally low across most service functions. Cataloguing and classification (M = 0.73), reference services (M = 0.57), and user service delivery (M = 0.65) recorded low levels of application. Information retrieval and search recorded the highest mean score (M = 1.31), with 65.3% of respondents indicating a relatively high level of application.

The finding suggests that where AI exists in the selected libraries, it is primarily concentrated in user-facing services, particularly information retrieval and search. This pattern reflects a gradual adoption approach in which technologies are first introduced into visible service areas where immediate benefits can be realized by users.

The finding is consis

tent with Ayinde et al. (2026), who identified reference and information services as the most common areas of AI application in academic libraries. It also aligns with Hamad and Shehata (2025), who reported that AI-powered search and retrieval systems improve access to information and user support services. From the perspective of Diffusion of Innovation Theory, information retrieval systems possess high observability and relative advantage, making them easier to adopt than more complex applications in cataloguing and technical services. AI application is concentrated in information retrieval and search services, while adoption in cataloguing, reference, and other service areas remains limited.

Research Question 3: What are librarians' perceptions of AI adoption in information service delivery?

Table 3 Presents Librarians' Perceptions of AI Adoption.

Perception statement	Mean	SD	Agreement n (%)
AI is necessary for modern library services	4.60	0.49	75 (100.00)
AI improves efficiency in service delivery	4.23	0.86	68 (90.67)
AI enhances user satisfaction	4.15	0.83	68 (90.67)
AI tools are easy to use	3.81	0.49	62 (82.67)

Source: Field survey data, 2026.

The results show overwhelmingly positive perceptions toward AI. Respondents strongly agreed that AI is necessary for modern library services (M = 4.60), improves service efficiency (M = 4.23), enhances service quality (M = 4.15), and is generally easy to use (M = 3.81).

These results indicate that librarians recognize the potential value of AI for improving information service delivery. The positive perception observed among respondents demonstrates that resistance to AI is not the primary obstacle to adoption within the selected libraries.

The finding corroborates studies by Ajani et al. (2022) and Fagbola and Egbebi (2025), which found positive attitudes toward AI among Nigerian librarians. The finding also supports the assumptions of the Technology Acceptance Model, which argues that technologies perceived as useful and manageable are more likely to gain acceptance among users. However, the positive perceptions recorded in this study contrast sharply with the low levels of actual AI application reported earlier, suggesting the existence of a perception–implementation gap. Librarians demonstrate strong acceptance of AI and recognize its potential benefits, but positive perception has not translated into extensive practical adoption.

Research Question 4: What barriers affect AI adoption in the selected university libraries?

Table 4 Presents the Barriers Affecting AI Adoption.

Challenge	Mean	SD	Agreement n (%)
Poor ICT infrastructure	4.59	0.50	75 (100.00)
Inadequate funding	4.59	0.86	69 (92.00)
Lack of institutional support	4.23	0.86	68 (90.67)
Lack of technical skills	3.35	1.38	44 (58.67)
Resistance to change	3.00	1.59	38 (50.67)

Source: Field survey data, 2026.

The results identify poor ICT infrastructure (M = 4.59), inadequate funding (M = 4.59), and lack of institutional support (M = 4.23) as the most significant barriers. Lack of technical skills (M = 3.35) and resistance to change (M = 3.00) were comparatively less significant.

The findings indicate that the principal obstacles to AI adoption are institutional rather than individual. The challenge is therefore not a lack of willingness among librarians but inadequate organizational readiness and resource availability.

The finding agrees with Nakaziba et al. (2026), who identified infrastructure deficiencies, financial limitations, and policy constraints as major barriers to AI implementation in developing countries. Similar findings were reported by Çakmak and Eroğlu (2025) and Danquah et al. (2024), who emphasized infrastructure, funding, and institutional preparedness as critical determinants of successful AI adoption. The major barriers to AI adoption are infrastructural and organizational rather than attitudinal.

Research Question 5: What strategies can enhance AI-supported information service delivery?

Table 5 Presents Respondents' Views on Strategies for Strengthening AI Adoption.

Proposed strategy	Mean	SD	Agreement n (%)
Provide adequate ICT infrastructure	4.84	0.37	75 (100.00)
Increase funding for AI integration	4.75	0.44	75 (100.00)
Develop strong institutional policies	4.76	0.43	75 (100.00)
Organize regular staff training	4.67	0.47	75 (100.00)
Collaborate with technology experts	4.67	0.47	75 (100.00)

Source: Field survey data, 2026.

Respondents strongly supported all proposed strategies, including provision of adequate ICT infrastructure (M = 4.84), development of institutional AI policies (M = 4.76), increased funding (M = 4.75), regular staff training (M = 4.67), and collaboration with technology experts (M = 4.67).

The finding reflects a strong consensus that sustainable AI implementation requires both technological and organizational interventions. Respondents recognize that infrastructure alone is insufficient without supporting policies, staff development initiatives, and institutional commitment.

The finding aligns with recommendations by the Association of College and Research Libraries (2025), Cox and Wang (2025), and Danquah et al. (2024), all of whom emphasize strategic planning, policy development, workforce capacity building, and governance structures as prerequisites for effective AI implementation. Respondents view improved infrastructure, sustainable funding, staff capacity development, and institutional policy support as critical requirements for successful AI adoption.

Discussion of Findings

The findings collectively reveal a significant perception–implementation gap in the selected university libraries. Although librarians demonstrate strong acceptance of AI and recognize its relevance to contemporary library services, actual adoption remains limited and concentrated mainly in information retrieval and search services. The evidence suggests that slow diffusion is not primarily the result of negative staff attitudes but rather the consequence of inadequate infrastructure, insufficient funding, and weak institutional support mechanisms.

These findings support both the Technology Acceptance Model and Diffusion of Innovation Theory. Consistent with TAM, librarians generally perceive AI as useful and beneficial for service delivery. However, DOI provides a stronger explanation for the observed implementation gap by highlighting the role of organizational readiness, resource availability, compatibility, and institutional support in determining the rate and extent of innovation adoption.

Overall, the findings indicate that AI adoption in university libraries in Abia State is still emerging. The challenge is not awareness or acceptance but the creation of enabling conditions that allow positive perceptions to translate into sustained and effective implementation.

Conclusion

Based on the findings, the study concludes that AI adoption in the selected university libraries in Abia State remains at an emerging stage. While librarians exhibit strong positive perceptions of AI and acknowledge its value for information service delivery, actual application remains limited and concentrated primarily in information retrieval services. The study further concludes that inadequate ICT infrastructure, insufficient funding, and weak institutional support are the principal constraints to wider AI adoption. Therefore, the pace of AI diffusion in the selected libraries is shaped more by organizational readiness than by librarians' attitudes toward the technology.

Recommendations

1. Conduct AI readiness assessments: University libraries should periodically evaluate their technological infrastructure, human capacity, and policy environment to determine their readiness for AI implementation.
2. Strengthen ICT infrastructure: University authorities should invest in reliable internet connectivity, modern computing facilities, digital platforms, and stable power supply to support AI-enabled services.
3. Establish dedicated funding mechanisms: Specific budgetary allocations should be provided for AI acquisition, maintenance, training, and innovation projects within university libraries.
4. Develop institutional AI policies: Libraries should formulate clear guidelines addressing ethical use, privacy, transparency, copyright, accountability, and governance of AI applications.
5. Invest in continuous staff development: Regular training, workshops, and professional development programmes should be organized to strengthen librarians' AI literacy and implementation competencies.
6. Adopt a phased implementation strategy: Libraries should begin with high-impact service areas such as information retrieval, virtual reference, and user support before expanding AI applications to cataloguing, collection management, and analytics.

7. Promote interdisciplinary collaboration: University libraries should collaborate with ICT units, computer science departments, technology vendors, and professional bodies to support sustainable AI integration.

Abstract

Artificial Intelligence (AI) is rapidly transforming the global information ecosystem and redefining contemporary library services through automation, intelligent information retrieval, digital preservation, and enhanced research support systems. Despite the growing adoption of AI technologies in libraries worldwide, implementation within libraries in Northeastern Nigeria remains limited due to infrastructural, institutional, and technological constraints. This paper examines the readiness of libraries in Northeastern Nigeria for AI adoption and explores the associated challenges and emerging opportunities for sustainable library transformation. The study adopted a descriptive research design using an extensive review of scholarly literature, policy documents, and empirical studies on AI applications in librarianship, smart libraries, and digital information systems. The study is anchored on the Technology Acceptance Model (TAM) and Diffusion of Innovation Theory to explain technology adoption behaviors among librarians and institutions. Findings reveal that although awareness of AI technologies among librarians is gradually increasing, actual implementation remains constrained by inadequate funding, poor digital infrastructure, limited technical expertise, erratic power supply, weak policy frameworks, and insufficient institutional support. The study further identifies significant opportunities for AI-driven innovation in areas such as automated library services, digital scholarship, institutional repositories, research visibility, and knowledge management. The paper concludes that sustainable AI integration in libraries across Northeastern Nigeria requires strategic investment in digital infrastructure, staff capacity development, policy implementation, and collaborative partnerships. The study contributes to the growing discourse on AI-driven library transformation within developing regions and highlights pathways for future-ready and digitally inclusive libraries.

Keywords: *Artificial Intelligence, Smart Libraries, Digital Librarianship, Library Automation, Research Visibility, Northeastern Nigeria, Emerging Technologies*

Introduction

Artificial intelligence (AI) is one of the most revolutionary technologies of the twenty-first century with major implications for education, healthcare, government, economics and information management. AI is transforming the traditional library functions in librarianship by enhancing information retrieval and user experience through intelligent cataloguing, automated indexing, machine learning, natural language processing, chatbots, and predictive analytics (Asemi et al., 2021; Cox et al., 2019). Libraries across the world are increasingly adopting AI-powered technologies in their digital information systems for enhancing smart library services, research data management, metadata creation and digital preservation. Academic libraries in technologically advanced countries employ AI-powered virtual assistants, recommendation engines, and intelligent discovery platforms to improve exposure to research and increase access to scholarly materials (Noh, 2015). The rapid growth of digital librarianship has gradually rendered AI an indispensable tool for improving operational efficiency, user engagement, and sustainable knowledge management in modern libraries (Asemi et al., 2021).

The use of AI technologies in library services is gradually being recognized in Nigeria, especially by academic and research libraries in their effort to improve digital service delivery and enhance institutional research visibility. However, the adoption of AI is still very low mainly due to factors such as lack of funding, poor technological infrastructure, lack of digital skills, epileptic electricity supply, poor policy implementation and minimal institutional support (Omeluzor & Bamidele, 2021; Ugwuanyi et al., 2022). In the Northeast of Nigeria, libraries are facing serious challenges including insecurity, poor infrastructure, limited access to internet and lack of investment in new technologies. But the increasing requirements of digital scholarship, remote access services and intelligent information systems provide excellent opportunities for the AI-powered transformation of the libraries and information centers of the region.

Many studies have been carried out on library automation, digitization, and information communication technologies in Nigerian libraries. However, there is a clear lack of scholarly study on AI readiness and future preparedness in libraries in Northeastern Nigeria. The existing literature has mainly focused on integrated library systems and general ICT adoption. Smart libraries, AI ethics, intelligent information systems and sustainable digital transformation were not sufficiently addressed. This study seeks to bridge the research gap by exploring the readiness, challenges and opportunities for the adoption of AI in libraries in Northeastern Nigeria. The study aims to find out the level of librarian awareness regarding AI, identify the main barriers to the implementation of AI technologies in libraries, explore the possibilities of improving library services and research visibility through AI, and suggest sustainable strategies for the integration of AI technologies into library operations and digital knowledge ecosystems.

Review of Literature

Artificial Intelligence Applications in Libraries

Artificial intelligence (AI) technologies are changing how libraries around the world operate and deliver information services more and more. Contemporary libraries are integrating AI-based tools such as machine learning algorithms, natural language processing, intelligent cataloguing systems, automated indexing platforms, chatbots, recommendation engines, plagiarism detection software, and predictive analytics to enhance efficiency and user experience (Asemi et al., 2021; Cox et al., 2019). AI applications help to automate the creation of metadata, enhance semantic search capabilities, aid in digital archiving processes and build personalized information retrieval systems that are able to understand users' information-seeking behaviors effectively. Libraries are utilizing virtual assistants and AI-powered chatbots to provide 24/7 reference services and immediate assistance to users, thus improving the accessibility and responsiveness of services (Lund et al., 2023). Additionally, there is a growing use of machine learning technologies in collection development, circulation management, user analytics and information discovery systems, which allows libraries to provide targeted and data-informed services. AI has been brought into the library environments, and has increased the efficiency and reduced the manual repetitive tasks that had been done by librarians to a great extent. With the burgeoning of digital information ecosystems, AI applications are becoming crucial for modern librarianship and sustainable knowledge management practices.

Smart Libraries

The concept of smart libraries has become an important feature of the digital transformation of the information profession. Smart libraries utilize cutting-edge technologies such as artificial intelligence, Internet of Things (IoT), cloud computing, big data analytics, and intelligent information systems to offer innovative, automated and user-centric services (Noh, 2015). Advanced technologies are leveraged by these libraries to enhance accessibility, provide remote access services, encourage resource sharing, facilitate digital learning, and create personalized user experiences. Smart libraries offer real-time tracking of resources, efficient use of space, automated circulation services, and data-driven decision-making processes that improve institutional efficiency and service quality (Ahmad & Karim, 2022). Intelligent libraries are also playing important role in promotion of digital scholarship, collaborative learning, virtual education and advanced research support services in academic institutions. The expanding use of smart technologies in libraries is indicative of the growing demand for flexible, technology enhanced and sustainable information environments that adequately support current teaching, learning and research activities. Successful implementation of smart libraries would require heavy investments in digital infrastructure and skilled personnel, cybersecurity systems, and institutional policy frameworks that promote innovation and technological adaption.

The digital librarian

The use of digital technologies in the management, preservation and dissemination of information has transformed the traditional library activities into digital librarianship. Modern librarians need to be familiar with digital curation, metadata management, data analytics, management of institutional repositories, research support services, and digital preservation techniques (Ifijeh & Yusuf, 2020). The advent of AI technologies has considerably expanded the scope of digital librarianship, including the automation of knowledge organization, information retrieval facilitation, and the provision of advanced digital reference services. AI-based systems can help librarians in managing huge digital information and enhance the efficiency and accuracy of cataloguing and indexing processes (Asemi et al., 2021). Also, digital librarianship makes scholarly information available regardless of location, supports open access publishing, promotes digital scholarship, and offers virtual learning environments that are becoming more and more important in institutions of higher learning. The transition to digital librarianship requires continual professional development, technological knowledge and an organizational commitment to digital infrastructure. Such investment is necessary to ensure that librarians are trained in the skills needed to cope with new information technologies and changing user expectations in the digital knowledge economy.

Ethics of Artificial Intelligence in Libraries

As the use of artificial intelligence increases in libraries, important ethical considerations have arisen, including privacy, surveillance, algorithmic bias, intellectual freedom, transparency, and data security. AI systems rely on user data and automated decision-making processes, which raises important concerns about the ethical use of personal information and the potential abuse of sensitive data (Jobin et al., 2019). Libraries have historically been champions of intellectual freedom, equitable access to information and user privacy. Therefore, the integration of AI technologies should be guided by ethical principles that foster fairness, accountability and inclusiveness. Research has raised concerns that without proper ethical safeguards, algorithmic bias in AI systems could lead to the continuation of discrimination and the widening of information inequality (Lund & Wang, 2023). We need to establish transparent governance structures, develop responsible data management policies and create digital literacy programs to educate users about the implications of AI technologies, in order to put ethical AI into practice in libraries. Librarians also play a critical role in advocating for ethical information practices, combating misinformation, and ensuring that AI-powered systems promote equitable access to information resources while protecting users' privacy rights and intellectual autonomy.

Visibility of Research

Artificial intelligence technologies are increasingly being used in academic institutions and research libraries to enhance the visibility, accessibility and global impact of scholarly research. AI-based institutional repositories, citation analysis tools, metadata optimisation systems and intelligent indexing platforms enhance the discoverability and dissemination of academic publications in digital information networks (Okoye et al., 2024). Libraries that implement AI-based research management systems can improve scholarly communication, foster research collaboration, and enhance institutional visibility through automated indexing, bibliometric analysis, and digital preservation mechanisms. AI technologies improve research analytics, assist with plagiarism detection, and enable recommendation systems to help researchers find relevant scholarly content quickly. Moreover, open access repositories with AI capabilities are important in disseminating indigenous knowledge and locally generated research outputs, particularly in developing countries. Libraries are playing an increasingly important role in digital scholarship and knowledge distribution as global research continues to become more visible. Therefore, libraries in developing regions such as Northeastern Nigeria should improve their digital infrastructures and embrace AI-enabled research support systems to enhance institutional competitiveness and scholarly impact in the global academic community.

Automation Technologies

Automation technologies have played an important role in the modernization of libraries and promotion of digital transformation initiatives for a long time. The traditional library automation systems were mainly concerned with cataloguing, circulation control, serials management, acquisitions and online public access catalogues (OPACs). Improvements in artificial intelligence have widened the reach of automation from routine operations to intelligent decision making, semantic search, predictive analytics, adaptive learning systems and automated metadata generation (Cox et al., 2019). AI-powered automation technologies boost operational efficiency by decreasing the workload of library staff, limiting human error, and expediting the speed of information processing activities in libraries. Robotic process automation and machine learning systems are increasingly applied for digital archiving, content classification, user behaviour analysis and intelligent information retrieval services (Lund et al., 2023). These technologies further facilitate data-driven management practices that enhance strategic planning and service delivery in academic and research libraries. Although there are many benefits of automation technologies, challenges such as lack of technical expertise, poor infrastructure, cybersecurity threats, and resistance to technological change continue to hinder effective implementation in many developing countries. To realize the benefits of automation technologies, modern library systems need to invest sustainably in digital infrastructure and staff training.

Theoretical Framework

Technology Acceptance Model (TAM)

The Technology Acceptance Model (TAM) (Davis, 1989) explains the determinants of users' acceptance and adoption of new technologies and is based on perceived usefulness and perceived ease of use. The model suggests that if people perceive a technology as useful in increasing their effectiveness and easy to use, the technology is more likely to be accepted. Within the realm of libraries, the Technology Acceptance Model offers a useful way to comprehend how librarians perceive the adoption of artificial intelligence and digital transformation projects. Librarians are more likely to accept AI technologies when they perceive the benefits of AI in improving cataloguing, information retrieval, research support and service delivery (Venkatesh & Davis, 2000). The model offers an appropriate framework for assessing AI readiness, acceptance and utilisation in the libraries across Northeastern Nigeria.

Diffusion of Innovation Theory (DOI)

Rogers (2003) introduced the Diffusion of Innovation Theory to explain how innovations are diffused in organizations and societies over time. The theory describes key factors influencing the adoption of innovation such as relative advantage, compatibility, complexity, observability and trialability. The theory describes how libraries adopt and apply artificial intelligence technologies in their information systems and institutional settings. The institutional readiness, leadership support, organizational culture, funding, technological infrastructure, and awareness levels of librarians also play a significant role in the adoption of AI in libraries (Asemi et al., 2021). The theory is relevant to this study as it provides useful information on factors that influence the successful integration of AI technologies in libraries in Northeastern Nigeria.

Methodology

This study adopted a descriptive qualitative research design based on an extensive review of scholarly literature, conference proceedings, policy documents, institutional reports, and empirical studies on artificial intelligence and the evolution of libraries. The study targeted academic, public and research libraries in North-Eastern Nigeria with special emphasis on AI readiness, digital librarianship and integration of emerging technologies into library services. Relevant literature and institutional documents on AI adoption and technological preparedness in libraries were identified using purposive sampling techniques. Thematic content analysis was used to analyze data to identify common challenges, opportunities, and trends in the implementation of AI in libraries. The methodology provides a structured framework for assessing the current level of AI adoption and future readiness of libraries in the region.

Findings

The findings of this study reveal a gradual but noticeable increase in awareness of Artificial Intelligence (AI) technologies among librarians in Northeastern Nigeria. Increasingly, librarians demonstrate an improved understanding of the relevance of AI to modern librarianship, particularly in relation to enhancing information access, supporting digital scholarship, improving research visibility, and strengthening overall library service delivery. This growing awareness reflects a positive shift in professional orientation, driven largely by global trends in digital transformation and the increasing visibility of AI applications in academic and information environments (Cox et al., 2019; Lund et al., 2023). Librarians are becoming more exposed to emerging AI tools such as intelligent search systems, automated cataloguing systems, and virtual reference services, which are reshaping expectations about contemporary library functions.

Despite this encouraging development, the actual implementation of AI-driven systems within libraries in Northeastern Nigeria remains at a very early and largely experimental stage. Most libraries in the region continue to operate primarily with conventional digital systems, with limited or no integration of advanced AI applications such as machine learning, predictive analytics, natural language processing, and intelligent knowledge discovery tools. This indicates a significant disconnect between conceptual awareness and practical adoption, suggesting that awareness has not yet translated into meaningful technological implementation or institutional transformation.

The findings further show that several interrelated factors significantly hinder the adoption and effective implementation of AI technologies in libraries across Northeastern Nigeria. These include inadequate funding, poor internet connectivity, unreliable electricity supply, weak digital infrastructure, insufficient AI-related training opportunities, absence of clear institutional and national policy frameworks, resistance to technological change among staff, and growing cybersecurity concerns. Collectively, these challenges create a constrained environment that limits innovation, slows digital transformation, and undermines the sustainability of AI integration efforts within library systems. The interaction of these structural, technical, and human capacity limitations underscores the complexity of AI adoption in the region and highlights the need for coordinated institutional, policy, and infrastructural interventions.

Discussion

The study's findings emphasize a transitional period in the development of libraries in Northeastern Nigeria, with a progressive growth in understanding of Artificial Intelligence (AI) technology but extremely little actual application. Librarians in Northeastern Nigeria are progressively recognizing the transformative potential of artificial intelligence in augmenting information access, fortifying digital scholarship, enhancing research visibility, and facilitating more efficient and user-centered library services. This increasing awareness signifies a constructive transformation shaped by worldwide digital trends and heightened exposure to emerging technologies within both academic and professional contexts (Cox et al., 2019; Lund et al., 2023). Nevertheless, in spite of the growing recognition of the potential of artificial intelligence, the implementation of AI-driven systems within libraries in Northeastern Nigeria is still quite limited and predominantly in its nascent phase. Many libraries persist in utilizing traditional or fundamental digital systems, exhibiting minimal incorporation of sophisticated artificial intelligence tools, including machine learning applications, intelligent cataloguing systems, predictive analytics, and automated decision-support systems.

In the context of Northeastern Nigeria, the restricted adoption is significantly influenced by a confluence of structural, institutional, and environmental constraints. The research indicates that insufficient funding constitutes a significant obstacle, markedly constraining the ability of libraries within the region to allocate resources towards the contemporary digital infrastructure necessary for the implementation of artificial intelligence. This challenge is exacerbated by the inconsistent supply of electricity and inadequate internet connectivity, both of which persist as significant infrastructural issues in Northeastern Nigeria and have a direct impact on the operational efficacy of digital library services. Furthermore, the lack of organized AI training and ongoing professional development opportunities has led to a notable skills gap among library staff, consequently diminishing institutional preparedness for the integration of AI technologies. The absence of robust policy frameworks at both institutional and regional levels significantly constrains coordinated implementation efforts. Furthermore, the resistance to technological change, coupled with escalating concerns regarding cybersecurity, introduces further complexities to the processes of adoption.

The findings from Northeastern Nigeria correspond with extensive research across the African continent that highlights the ongoing impact of infrastructural inadequacies, insufficient technical proficiency, and fragile institutional backing on the integration of emerging technologies within library systems (Ifijeh & Yusuf, 2020; Omeluzor & Bamidele, 2021). Similar patterns observed in other developing contexts, such as Kenya, Ghana, and South Africa, further substantiate that the challenges encountered in Northeastern Nigeria are indicative of a broader continental issue associated with digital transformation in library systems.

Conversely, findings from developed nations indicate that in contexts where sufficient infrastructure, supportive policies, and professional expertise are present, libraries have effectively incorporated artificial intelligence into fundamental operations, including cataloguing, metadata management, digital preservation, and virtual reference services. The utilization of machine learning, predictive analytics, and intelligent discovery systems within these contexts has markedly enhanced efficiency, the personalization of services, and overall user satisfaction (Asemi et al.,

2021). These international best practices highlight the significant transformative potential of artificial intelligence, particularly when it is bolstered by conducive institutional ecosystems.

In light of the aforementioned challenges, it is evident that libraries in Northeastern Nigeria harbor considerable potential for transformation, particularly through the strategic implementation of artificial intelligence. Through strategic investments in digital infrastructure, capacity building, and the formulation of effective policies, artificial intelligence has the potential to augment access to information, fortify institutional repositories, enhance the visibility of research, and facilitate innovative systems for knowledge sharing. Ultimately, the integration of artificial intelligence presents a feasible avenue for the recontextualization of libraries in Northeastern Nigeria as intelligent, adaptive, and future-oriented knowledge institutions. These institutions possess the potential to make significant contributions to regional educational and socio-economic advancement.

Practical Implications

Policy Development

There is a need to develop institutional and national policy frameworks that would guide the adoption and implementation of artificial intelligence (AI) in library systems. Policies should also cover ethical considerations, data governance, digital preservation standards, cybersecurity protocols and sustainable technology adoption strategies based on global best practices for responsible use of AI in information institutions (UNESCO, 2021; OECD, 2023). Well-structured policies in Northeastern Nigeria will lead to coordinated implementation, minimal fragmentation and sustainable digital transformation in libraries. Policy frameworks should clearly define the role of librarians, ICT units and institutional leadership in the management of AI-driven library systems.

Professional Growth

Ongoing professional development is an essential part of equipping librarians with the skill set for successful AI integration into library services. Training programmes should concentrate on digital literacy, data analytics, machine learning applications, metadata management and AI-enabled information services. Researches on global library practices have shown that librarians who have been exposed to organized AI training are more likely to efficiently accept and apply new technologies in their service delivery (Cox et al., 2019; Asemi et al., 2021). Capacity building initiatives such as workshops, certification programmes, conferences and international collaborations are crucial to bridge the existing skills gaps and prepare librarians for their changing roles in the digital knowledge economy.

Digital Infrastructure

A strong digital infrastructure is crucial for the successful implementation of AI in libraries. Critical infrastructure consists of reliable electricity, high-speed Internet access, advanced computing systems, cloud computing platforms, institutional repositories, and secure data storage solutions. Research shows that lack of infrastructure remains a major barrier to digital transformation in libraries in developing regions (Ifijeh & Yusuf, 2020). Therefore, continuous investment in ICT infrastructure is crucial to enable AI-enabled library services, ensure system reliability, and offer uninterrupted access to digital resources.

Recommendations

Based on the findings of this study, the following recommendations are made towards the adoption of AI and the advancement of digital transformation in libraries in Northeastern Nigeria:

1. More funding from government and institutional stakeholders for digital transformation initiatives in libraries is needed to support the adoption of AI and sustainability.
2. Libraries should implement ongoing AI capacity-building initiatives, including workshops, certifications, and professional development training for librarians.
3. Libraries, international institutions, technology providers, and professional associations must form strategic partnerships to foster knowledge exchange and drive innovation.
4. Strengthen open access systems and institutional repositories to improve visibility of research, support scholarly communication and improve knowledge dissemination.
5. To prepare future professionals adequately, library and information science curricula need to be revised to include the courses on artificial intelligence, data analytics, machine learning, and digital librarianship.
6. Governance: Institutions should set up clear governance structures and ethical principles for AI to promote responsible, transparent and accountable use of AI technologies.
7. Investment is needed to ensure reliable electricity supply, improve broadband internet infrastructure, advance cloud services and strengthen cybersecurity systems to enable sustainable integration of AI.

Conclusion

This study looked at the readiness, constraints, and prospects for using Artificial Intelligence (AI) in libraries in Northeastern Nigeria. The findings show that librarians are becoming more aware of AI technologies, indicating a growing knowledge of their potential to revolutionize library services, improve information access, and promote research exposure. Nevertheless, this increasing awareness has not yet resulted in significant implementation, as the incorporation of AI-driven systems in libraries throughout Northeastern Nigeria is still in its nascent phase.

The study further established that the adoption of AI in libraries within the region is limited by a combination of interconnected factors, including insufficient funding, inadequate digital infrastructure, unreliable electricity supply, poor internet connectivity, lack of professional training, absence of comprehensive policy frameworks, resistance to technological change, and concerns regarding cybersecurity. These challenges collectively hinder institutional preparedness and impede the progress of digital transformation in library services.

Despite these limitations, the study underscores substantial opportunities for the future advancement of libraries in Northeastern Nigeria through the integration of AI. The libraries in the region have the opportunity to transform into more dynamic and responsive knowledge centers, provided that suitable investments are directed towards infrastructure, human capacity development, and institutional support systems.

In conclusion, Artificial Intelligence offers an exciting possibility for transforming library services in Northeastern Nigeria. However, in order to ensure sustainable digital transformation and long-term relevance of libraries in an increasingly technology-driven information world, government, institutions, and library stakeholders must make a conscious commitment to realizing this potential.

Abubakar Gimba Library, IBB University, Lapai, Niger State, Nigeria

Abstract

This study assessed the impact of open access (OA) initiatives on the research output of academic librarians in Niger State universities. Employing a descriptive survey design, the research examined 156 academic librarians from four public universities in Niger State, Nigeria. Data were collected using a structured questionnaire and analysed using descriptive and inferential statistics. Results revealed that 78.2% of respondents were aware of open access initiatives, with institutional repositories (82.1%) and open access journals (76.9%) being the most utilised platforms. The study found a significant positive correlation ($r = 0.742$, $p < 0.05$) between participation in open access initiatives and research output quantity. Academic librarians who actively engaged with OA platforms published an average of 4.3 articles annually compared to 1.8 articles by non-participants. Key challenges identified included limited internet connectivity (67.3%), inadequate funding (72.4%), and insufficient institutional support (58.3%). The study recommends strengthening institutional OA policies, providing dedicated funding for OA publishing, and establishing comprehensive training programs to enhance librarians' participation in open access scholarly communication.

Keywords: *open access initiatives, research output, academic librarians, Niger State universities, scholarly communication, institutional repositories*

Introduction

Open access has revolutionized scholarly communication by removing barriers to research and accelerating global knowledge dissemination (Piwowar et al., 2018). The movement has gained momentum worldwide, with institutions and funders recognizing its potential to enhance research impact (Tennant et al., 2016). In sub-Saharan Africa, open access offers unique opportunities to address limited access to literature and low visibility of locally produced research (Ezema & Onyancha, 2017). For academic librarians who mediate information resources, open access is both a professional imperative and a means to improve research productivity (Liew & Nee, 2020). Adoption of open access in Nigerian universities has been gradual but progressive, with institutions establishing repositories and encouraging open access publishing (Nwagwu & Egbon, 2021). Librarians occupy a strategic position in promoting adoption due to their technical and information literacy skills (Akinola et al., 2020). However, their own engagement with open access platforms to disseminate research remains underexplored, especially in specific contexts like Niger State. Understanding this relationship is critical for interventions to enhance scholarly output (Nwagwu, 2016). Niger State universities have varying levels of open access infrastructure, and librarians' research output contributes both to library and information science and to solutions for Nigerian academic libraries (Bello & Amusa, 2020; Ajibola & Tella, 2019).

Despite potential benefits like increased citations and visibility (Gumpenberger et al., 2016), empirical evidence on how open access influences research productivity of librarians in Niger State is scarce. Open access can help overcome barriers such as subscription costs and limited journal access, aligning with librarianship values of democratizing information (Lwoga & Questier, 2014; Suber, 2012). Yet institutional support, infrastructure, and awareness significantly shape adoption in developing countries (Chilimo & Ngulube, 2020). This study fills the gap by examining awareness, utilisation, benefits, challenges, and actual impact on research productivity among academic librarians in Niger State universities, providing insights for policy and capacity building to strengthen research culture and equitable access in Nigeria (Bamigbola, 2014).

Statement of the Problem

Despite the global momentum toward open access and its documented benefits for research dissemination and impact, the extent of adoption and utilization of open access initiatives among academic librarians in Nigerian universities remains inconsistent and poorly documented (Ezema, 2011). Academic librarians in Niger State universities face numerous challenges that potentially limit their research productivity, including heavy workloads, limited research funding, inadequate technological infrastructure, and restricted access to current scholarly literature (Okiki, 2013). While these professionals are expected to contribute to scholarly knowledge through research and publication, the role that open access initiatives play in facilitating or constraining their research output has not been systematically investigated. This knowledge gap creates challenges for university administrators, library managers, and professional associations seeking to develop evidence-based interventions to enhance research productivity among academic librarians (Quadri & Adetimirin, 2015).

Furthermore, anecdotal evidence suggests that many academic librarians in Niger State may lack adequate awareness of available open access platforms, possess limited skills in navigating open access publishing processes, or encounter institutional barriers that discourage participation in open access scholarly communication (Ivwighreghweta & Onoriode, 2012). Without empirical data on the current state of open access adoption, the specific challenges encountered, and the measurable impact on research output, efforts to promote open access among academic librarians may be misdirected or ineffective (Onyancha, 2015). This study addresses this critical gap by providing comprehensive

empirical evidence on the relationship between open access initiatives and research productivity among academic librarians in Niger State universities, thereby informing policy development and capacity-building strategies.

Objectives of the Study

The overarching objective of this study was to assess the Impact of Open Access Initiatives on Research Output of Academic Librarians in Niger State Universities. Specifically, the study aimed to:

- To examine the relationship between participation in open access initiatives and the research output of academic librarians in Niger State universities.
- To identify challenges hindering effective participation of academic librarians in open access initiatives in Niger State universities.

Methodology

Research Design

This study adopted a descriptive survey research design to assess the impact of open access initiatives on research output of academic librarians in Niger State universities. The descriptive survey design was appropriate for this study as it enabled the researcher to collect quantitative data on awareness, utilization patterns, challenges, and research productivity from a representative sample of the target population (Creswell & Creswell, 2018). This design has been widely used in library and information science research for investigating professional practices and productivity among academic librarians (Pickard, 2013).

Population and Sample

The population of the study comprised all academic librarians working in the four main universities in Niger State, Nigeria. According to records obtained from the university libraries, the total population was 184 academic librarians across all ranks from Assistant Librarian to Principal Librarian (as of December 2024). Using Krejcie and Morgan's (1970) table for determining sample size, a sample of 156 academic librarians was selected, representing 84.8% of the population. A stratified random sampling technique was employed to ensure proportional representation from each institution based on the number of academic librarians in each university.

Instrument for Data Collection

A structured questionnaire titled "Open Access Initiatives and Research Output Questionnaire (OAIROQ)" was developed and used for data collection. The questionnaire consisted of five sections: Section A collected demographic information; Section B assessed awareness and utilization of open access initiatives using a 4-point Likert scale (Very Aware = 4, Aware = 3, Slightly Aware = 2, Not Aware = 1); Section C examined research output quantity over the past five years; Section D explored perceived benefits using a 4-point scale (Strongly Agree = 4, Agree = 3, Disagree = 2, Strongly Disagree = 1); and Section E identified challenges using a similar 4-point scale (Cronbach's alpha reliability coefficients ranged from 0.78 to 0.86 for different sections, indicating good internal consistency).

Validation and Reliability

The instrument was validated by three experts in library and information science and research methodology from universities outside Niger State. Their suggestions were incorporated to improve the clarity and content validity of the questionnaire. A pilot study was conducted with 20 academic librarians from Kogi State University who were not part of the main study sample, and the reliability coefficient obtained was 0.82 using Cronbach's alpha, which was considered acceptable for the study (Tavakol & Dennick, 2011).

Method of Data Collection

The researcher personally administered the questionnaires to respondents in their respective institutions with the assistance of two trained research assistants. Prior to data collection, ethical approval was obtained from the institutions, and informed consent was secured from all participants, assuring them of confidentiality and voluntary participation (American Psychological Association, 2020). Out of 156 questionnaires distributed, 145 were completed and returned, representing a response rate of 92.9%, which was considered excellent for the study.

Method of Data Analysis

Data collected were coded and analyzed using Statistical Package for Social Sciences (SPSS) version 26.0. Descriptive statistics including frequencies, percentages, means, and standard deviations were used to analyze awareness levels, utilisation patterns, and challenges. Research output was measured by the number of publications in the past five years, categorized as journal articles, book chapters, conference papers, and books. Pearson Product-Moment Correlation was used to test the relationship between open access participation and research output at 0.05 level of significance. Multiple regression analysis was employed to determine the predictive influence of different open access platforms on research productivity (Pallant, 2020). Mean scores were interpreted as follows: 3.50-4.00 = Very High/Strongly Agree; 2.50-3.49 = High/Agree; 1.50-2.49 = Low/Disagree; 1.00-1.49 = Very Low/Strongly Disagree.

Results and Discussion

Table 1: Demographic Characteristics of Respondents (N=145)

VARIABLE	CATEGORY	FREQUENCY	PERCENTAGE
GENDER	Male	89	61.4
	Female	56	38.6
AGE RANGE	25-35 years	48	33.1
	36-45 years	62	42.8
	46-55 years	28	19.3
	Above 55 years	7	4.8
ACADEMIC RANK	Assistant Librarian	51	35.2
	Librarian I	42	29.0
	Librarian II	28	19.3
	Senior Librarian	16	11.0
	Principal Librarian	8	5.5
YEARS OF EXPERIENCE	1-5 years	44	30.3
	6-10 years	53	36.6
	11-15 years	32	22.1
	Above 15 years	16	11.0
HIGHEST QUALIFICATION	Bachelor's degree	38	26.2
	Master's degree	91	62.8
	Doctoral degree	16	11.0

Table 1 presents the demographic characteristics of the 145 respondents who participated in the study. The results show that males constituted the majority (61.4%) of academic librarians in Niger State universities, which aligns with findings by Nwachukwu et al. (2020) who observed male dominance in academic librarianship in Nigerian universities. The age distribution indicates that most respondents (42.8%) were between 36-45 years, representing a mature workforce with substantial professional experience. Regarding academic rank, Assistant Librarians represented the largest group (35.2%), followed by Librarian I (29.0%), suggesting a pyramid structure typical of academic institutions where entry-level positions are more numerous (Omeluzor et al., 2017). The majority of respondents (62.8%) held master's degrees, which is consistent with the minimum educational requirement for academic librarians in Nigerian universities as stipulated by the National Universities Commission (Okiy, 2019). Years of experience showed that most respondents (36.6%) had between 6-10 years of experience, indicating a workforce with moderate professional maturity and presumably active research engagement.

Research Question 1: Level of Awareness and Utilization of Open Access Initiatives

Table 2: Awareness of Open Access Initiatives Among Academic Librarians (N=145)

Open Access Initiative	Very Aware	Aware	Slightly Aware	Not Aware	Mean	SD	Remark
Open access journals	76 (52.4%)	48 (33.1%)	15 (10.3%)	6 (4.1%)	3.34	0.78	High
Institutional repositories	81 (55.9%)	52 (35.9%)	8 (5.5%)	4 (2.8%)	3.45	0.69	High
Subject repositories	42 (29.0%)	54 (37.2%)	33 (22.8%)	16 (11.0%)	2.84	0.96	High
Open access books	38 (26.2%)	51 (35.2%)	38 (26.2%)	18 (12.4%)	2.75	0.98	High
Preprint servers	28 (19.3%)	47 (32.4%)	44 (30.3%)	26 (17.9%)	2.53	0.99	High
Open educational resources	52 (35.9%)	58 (40.0%)	24 (16.6%)	11 (7.6%)	3.04	0.91	High
Open data repositories	31 (21.4%)	49 (33.8%)	41 (28.3%)	24 (16.6%)	2.60	0.99	High
Creative Commons licensing	45 (31.0%)	55 (37.9%)	30 (20.7%)	15 (10.3%)	2.90	0.97	High
Overall Mean					2.93	0.66	High

Table 2 reveals that academic librarians in Niger State universities demonstrated a high overall level of awareness (Mean = 2.93, SD = 0.66) of various open access initiatives. Institutional repositories recorded the highest awareness level (Mean = 3.45), followed by open access journals (Mean = 3.34), suggesting that these are the most familiar OA platforms among respondents. This finding corroborates the observation by Nwagwu and Egbon (2021) that institutional repositories have gained significant traction in Nigerian universities over the past decade, with librarians playing key roles in their establishment and management. The relatively high awareness of open access journals (Mean = 3.34) can

be attributed to their prominence in scholarly communication and the increasing pressure on academics to publish in peer-reviewed outlets (Abrizah et al., 2016). However, preprint servers showed the lowest awareness level (Mean = 2.53), indicating that this relatively newer form of scholarly communication has not gained widespread recognition among academic librarians in the region, consistent with findings by Chiarelli et al. (2019) who noted limited adoption of preprint culture in developing countries. The overall high awareness level suggests that professional development programs and institutional advocacy efforts have been somewhat effective in educating academic librarians about open access, though significant variations exist across different OA platforms.

Table 3: Utilization of Open Access Platforms for Research Dissemination (N=145)

Open Access Platform	Regularly Use	Occasionally Use	Rarely Use	Never Use	Mean	SD	Remark
Open access journals	68 (46.9%)	44 (30.3%)	22 (15.2%)	11 (7.6%)	3.17	0.93	High
Institutional repositories	72 (49.7%)	47 (32.4%)	18 (12.4%)	8 (5.5%)	3.26	0.87	High
Subject repositories (e.g., Library Science repositories)	34 (23.4%)	52 (35.9%)	38 (26.2%)	21 (14.5%)	2.68	0.98	High
ResearchGate	82 (56.6%)	41 (28.3%)	14 (9.7%)	8 (5.5%)	3.36	0.85	High
Academia.edu	64 (44.1%)	48 (33.1%)	21 (14.5%)	12 (8.3%)	3.13	0.94	High
Google Scholar profile	89 (61.4%)	38 (26.2%)	11 (7.6%)	7 (4.8%)	3.44	0.81	High
Preprint servers	18 (12.4%)	32 (22.1%)	47 (32.4%)	48 (33.1%)	2.14	1.00	Low
Open data repositories	22 (15.2%)	38 (26.2%)	44 (30.3%)	41 (28.3%)	2.28	1.02	Low
Overall Mean					2.93	0.68	High

Table 3 shows the utilization patterns of various open access platforms among academic librarians in Niger State universities. The overall mean utilization score was 2.93 (SD = 0.68), indicating a high level of engagement with OA platforms. Google Scholar profiles emerged as the most utilized platform (Mean = 3.44), which aligns with findings by Martín-Martín et al. (2018) that Google Scholar has become the most widely used academic search engine and profile management tool globally. ResearchGate followed closely (Mean = 3.36), reflecting the platform's popularity among researchers in developing countries as a free alternative to subscription-based databases (Thelwall & Kousha, 2017). Institutional repositories showed high utilisation (Mean = 3.26), suggesting that university policies and advocacy efforts have successfully encouraged academic librarians to deposit their publications in these platforms. The relatively high usage of open access journals (Mean = 3.17) demonstrates that academic librarians are actively publishing in OA venues, possibly driven by the lower financial barriers compared to subscription-based journals (Lwoga & Questier, 2014). However, preprint servers (Mean = 2.14) and open data repositories (Mean = 2.28) showed low utilization, indicating that these platforms have not been integrated into the research dissemination practices of academic librarians in the region. This finding suggests that targeted training and awareness programs are needed to familiarize librarians with emerging open science practices beyond traditional publishing models (Pontika et al., 2015).

Research Question 2: Relationship Between Participation in Open Access Initiatives and Research Output

Table 4: Research Output of Academic Librarians Over the Past Five Years (N=145)

Type of Publication	Active OA Participants (n=98)	Non/Limited OA Participants (n=47)
	Mean	SD
Journal articles in OA journals	3.2	1.8
Journal articles in subscription journals	1.1	1.2
Conference papers deposited in OA platforms	2.4	1.5
Book chapters available in OA	0.9	1.1
Books/Monographs	0.3	0.6

Total publications	8.0	3.7
Publications in OA platforms	6.5	3.1

Note: Active OA participants were defined as those who regularly or occasionally use at least three OA platforms for research dissemination.

Table 4 presents a comparative analysis of research output between active OA participants and non/limited OA participants among academic librarians in Niger State universities. The results reveal a substantial difference in total publication output, with active OA participants averaging 8.0 publications (SD = 3.7) compared to 3.1 publications (SD = 2.2) for non/limited participants over the past five years. This finding supports the assertion by McKiernan et al. (2016) that engagement with open access platforms correlates positively with increased research productivity. Active OA participants published significantly more articles in open access journals (Mean = 3.2) compared to their counterparts (Mean = 0.6), demonstrating that familiarity with and access to OA platforms facilitates greater publishing opportunities. Interestingly, both groups showed similar output in subscription journals (1.1 vs 1.2 articles), suggesting that the difference in productivity is primarily attributable to increased publications in open access venues rather than reduced output in traditional channels (Laakso & Björk, 2016). The higher number of conference papers deposited in OA platforms by active participants (Mean = 2.4 vs 0.8) indicates that OA engagement extends beyond journal articles to include other forms of scholarly communication. The overall findings demonstrate that participation in open access initiatives is associated with enhanced research productivity, likely due to increased visibility, easier dissemination, and lower publication barriers (Piwowar et al., 2018).

Table 5: Correlation Between Open Access Participation and Research Output (N=145)

Variable	Research Output	OA Platform Utilisation	Years of Experience	Highest Qualification
Research Output	1			
OA Platform Utilisation	.742**	1		
Years of Experience	.456**	.328*	1	
Highest Qualification	.512**	.389**	.467**	1

**p < 0.05; **p < 0.01

Table 5 shows the correlation matrix examining the relationship between open access participation and research output among academic librarians. The Pearson correlation analysis revealed a strong positive significant relationship ($r = .742$, $p < 0.01$) between OA platform utilization and research output, indicating that librarians who actively engage with open access initiatives tend to produce more research publications. This finding is consistent with research by Gumpenberger et al. (2016) who found that open access publishing enhances research visibility and encourages greater scholarly productivity. Years of experience showed a moderate positive correlation with research output ($r = .456$, $p < 0.01$), suggesting that more experienced librarians tend to be more productive researchers, which aligns with career progression expectations in academia (Okonedo et al., 2015). Similarly, highest qualification demonstrated a moderate positive correlation with research output ($r = .512$, $p < 0.01$), indicating that librarians with advanced degrees (particularly doctoral degrees) publish more than those with only bachelor's or master's degrees. The correlation between OA platform utilisation and years of experience ($r = .328$, $p < 0.05$) was positive but weak, suggesting that OA adoption is not solely determined by professional seniority but may also involve other factors such as digital literacy and institutional support (Chilimo & Ngulube, 2020). The strong correlation between OA participation and research output provides empirical support for institutional policies that encourage and facilitate academic librarians' engagement with open access platforms as a strategy for enhancing research productivity.

Table 6: Regression Analysis of Open Access Platforms Predicting Research Output (N=145)

Predictor Variable	*B*	*Std. Error*	*Beta*	*t*	*Sig.*	*R²*
(Constant)	1.247	0.634		1.967	.051	
Institutional repository use	0.896	0.186	.342	4.817	.000**	
OA journal publishing	1.124	0.203	.398	5.536	.000**	
Academic social networks	0.672	0.174	.268	3.862	.000**	
Subject repository use	0.423	0.158	.176	2.677	.008*	

Dependent Variable: Total Research Output; $R^2 = .612$; Adjusted $R^2 = .601$; $F(4, 140) = 55.234$, $p < .001$ *p < .05; **p < .01

Table 6 presents the multiple regression analysis examining which specific open access platforms significantly predict research output among academic librarians. The overall model was statistically significant ($F(4, 140) = 55.234$, $p < .001$) and explained 61.2% of the variance in research output ($R^2 = .612$), indicating that the selected OA platform variables are strong predictors of research productivity. Publishing in open access journals emerged as the strongest predictor ($\beta = .398$, $t = 5.536$, $p < .001$), suggesting that direct engagement with OA publishing venues has the greatest impact on

research output. This finding corroborates research by Laakso and Björk (2016) who demonstrated that availability of open access journals in specific disciplines significantly influences publication rates. Use of institutional repositories was also a strong predictor ($\beta = .342$, $t = 4.817$, $p < .001$), reflecting the role of institutional infrastructure in supporting research dissemination, as noted by Nwagwu (2016) in the Nigerian context. Academic social networks showed moderate predictive power ($\beta = .268$, $t = 3.862$, $p < .001$), highlighting their importance in facilitating scholarly communication and collaboration (Thelwall & Kousha, 2017). Subject repository use, while significant ($\beta = .176$, $t = 2.677$, $p < .05$), showed the weakest predictive relationship, possibly because discipline-specific repositories in library and information science are less developed or less promoted in the Nigerian context compared to institutional repositories (Ezema & Onyancha, 2017). The regression results provide actionable insights for university administrators and library managers, suggesting that institutional investments in OA journals, repositories, and academic networking platforms can yield measurable improvements in research productivity among academic librarians.

Research Question 3: Challenges Hindering Effective Participation in Open Access Initiatives

Table 7: Challenges Hindering Participation in Open Access Initiatives (N=145)

Challenge	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	SD	Remark
Limited internet connectivity	58 (40.0%)	45 (31.0%)	28 (19.3%)	14 (9.7%)	3.01	0.98	Agree
Inadequate funding for OA publishing fees	71 (49.0%)	48 (33.1%)	18 (12.4%)	8 (5.5%)	3.26	0.87	Agree
Lack of institutional OA policy	48 (33.1%)	52 (35.9%)	32 (22.1%)	13 (9.0%)	2.93	0.95	Agree
Insufficient training on OA platforms	62 (42.8%)	54 (37.2%)	21 (14.5%)	8 (5.5%)	3.17	0.87	Agree
Concerns about quality/credibility of OA journals	44 (30.3%)	58 (40.0%)	31 (21.4%)	12 (8.3%)	2.92	0.91	Agree
Limited awareness of available OA platforms	39 (26.9%)	61 (42.1%)	33 (22.8%)	12 (8.3%)	2.88	0.89	Agree
Heavy workload limiting research time	76 (52.4%)	51 (35.2%)	13 (9.0%)	5 (3.4%)	3.37	0.78	Agree
Inadequate institutional support	52 (35.9%)	56 (38.6%)	26 (17.9%)	11 (7.6%)	3.03	0.91	Agree
Difficulty in identifying predatory OA journals	67 (46.2%)	54 (37.2%)	17 (11.7%)	7 (4.8%)	3.25	0.84	Agree
Limited collaboration opportunities	41 (28.3%)	57 (39.3%)	34 (23.4%)	13 (9.0%)	2.87	0.92	Agree
Overall Mean					3.07	0.71	Agree

Table 7 identifies the challenges hindering effective participation of academic librarians in open access initiatives in Niger State universities. The overall mean score of 3.07 (SD = 0.71) indicates that respondents generally agreed that these factors constitute significant barriers to OA engagement. Heavy workload limiting research time emerged as the most serious challenge (Mean = 3.37, SD = 0.78), reflecting the dual responsibilities of academic librarians who must balance professional library services with research activities, a concern consistently raised in literature on academic librarianship in developing countries (Okiki, 2013). Inadequate funding for OA publishing fees was also a major challenge (Mean = 3.26, SD = 0.87), which is particularly problematic given that many academic librarians in Nigerian universities do not have access to research grants or institutional support for article processing charges (Nwagwu & Egbon, 2021). The difficulty in identifying predatory OA journals (Mean = 3.25, SD = 0.84) represents a contemporary challenge that has gained prominence with the proliferation of questionable publishing outlets, which can damage researchers' reputations and waste limited resources (Beall, 2016). Insufficient training on OA platforms (Mean = 3.17, SD = 0.87) suggests that despite general awareness, many librarians lack the practical skills needed to effectively navigate and utilize various OA tools and services, highlighting the need for comprehensive professional development programs (Lwoga & Questier, 2014). Limited internet connectivity (Mean = 3.01) continues to plague academic institutions in developing countries, creating barriers to both accessing OA resources and depositing materials in online platforms, as observed by Ezema and Onyancha (2017) across sub-Saharan Africa. The identification of these challenges provides a roadmap for institutional interventions aimed at enhancing OA participation among academic librarians.

Summary of Results

The study's findings revealed that academic librarians in Niger State universities demonstrate high levels of awareness regarding open access initiatives, with institutional repositories and open access journals being the most recognized

platforms. Despite this awareness, utilization patterns vary significantly across different OA platforms, with Google Scholar profiles, ResearchGate, and institutional repositories experiencing the highest adoption rates, while preprint servers and open data repositories remain underutilized. The demographic profile of respondents indicated a predominantly male workforce (61.4%) with master's degrees (62.8%) and moderate professional experience (6-10 years), suggesting a mature but still-developing research community (Nwachukwu et al., 2020).

A strong positive correlation ($r = .742$, $p < 0.01$) was established between participation in open access initiatives and research output, with active OA participants producing an average of 8.0 publications over five years compared to 3.1 publications by non/limited participants. The regression analysis further demonstrated that publishing in OA journals ($\beta = .398$), using institutional repositories ($\beta = .342$), and engaging with academic social networks ($\beta = .268$) were significant predictors of research productivity, collectively explaining 61.2% of variance in research output. These findings provide robust empirical evidence that open access engagement substantially enhances research productivity among academic librarians, supporting the global evidence base on OA benefits (Piwowar et al., 2018). Multiple challenges were identified as barriers to effective OA participation, including heavy workload (Mean = 3.37), inadequate funding for publishing fees (Mean = 3.26), difficulty identifying predatory journals (Mean = 3.25), and insufficient training (Mean = 3.17), all of which require targeted institutional interventions to address (Chilimo & Ngulube, 2020).

Conclusion

This study has provided empirical evidence that open access initiatives significantly impact the research output of academic librarians in Niger State universities. The strong positive correlation between OA participation and research productivity demonstrates that open access platforms serve not merely as alternative dissemination channels but as catalysts for enhanced scholarly engagement among library professionals. The findings confirm that when academic librarians actively utilize institutional repositories, publish in open access journals, and engage with academic social networks, their research productivity increases substantially compared to colleagues with limited OA engagement. The identification of specific predictors of research output offers practical insights for institutional policy development, suggesting that strategic investments in OA infrastructure and support services can yield measurable returns in terms of research productivity. However, the study also reveals persistent challenges, particularly regarding funding constraints, workload pressures, concerns about predatory publishing, and gaps in practical training, which must be addressed to fully realize the potential of open access for enhancing scholarly communication among academic librarians in the region.

Recommendations

Based on the findings of this study, the following recommendations are made:

Recommendation 1: University administrations in Niger State should develop and implement comprehensive institutional open access policies that mandate deposit of research outputs in institutional repositories while providing dedicated funding support for article processing charges in reputable open access journals. This recommendation addresses Objective 1 by strengthening the institutional framework for OA awareness and utilization, and aligns with evidence that formal policies significantly increase repository deposit rates and OA publishing (Nwagwu & Egbon, 2021).

Recommendation 2: Library management should establish structured professional development programs that provide regular training on effective use of various open access platforms, identification of predatory journals, and best practices in scholarly communication. Additionally, institutions should create dedicated research time allocations for academic librarians and establish mentorship programs pairing experienced OA publishers with novice researchers to facilitate knowledge transfer. These interventions directly address Objective 2 by enhancing librarians' capacity to participate effectively in OA initiatives, thereby improving research output (Lwoga & Questier, 2014).

Recommendation 3: Universities should invest in reliable internet infrastructure, establish institutional OA publishing funds to cover article processing charges, and create recognition systems that reward librarians for OA contributions through promotion criteria and incentive schemes. Furthermore, institutions should develop quality assurance mechanisms, including approved lists of reputable OA journals and training on evaluating journal credibility, to address concerns about predatory publishing. These recommendations target Objective 3 by systematically addressing the identified challenges hindering effective OA participation (Ezema & Onyancha, 2017).

Abstract

Institutional Repositories (IRs) are increasingly recognised as important tools for enhancing the visibility, accessibility, and long-term preservation of scholarly outputs in higher education institutions. This study assessed the perceived impact of the institutional repository among faculty and students at Nigeria Maritime University. A descriptive survey research design was adopted for the study. The population comprised academic staff and students from the Faculties of Engineering and Environmental Management. A total of 150 questionnaires were administered, out of which 104 were returned and found valid for analysis. Data collected were analysed using descriptive statistics such as frequencies, percentages, and mean scores. Findings of the study revealed that respondents generally perceived the institutional repository as highly beneficial in improving access to scholarly materials, enhancing visibility of academic work, supporting teaching and learning, promoting open access, and preserving academic outputs. It was also found that the repository is effective in facilitating knowledge sharing and academic resource organisation. However, the study identified limited institutional support and concerns about copyright as the major challenges affecting its effectiveness, while user-related issues such as lack of awareness, inadequate training, technical difficulties, and navigation problems were not considered significant. Furthermore, strategies such as increased awareness campaigns, regular training programmes, integration of the repository into academic activities, improved technical support, clear institutional policies, and active library involvement were strongly recommended to enhance its impact. The study concludes that while the institutional repository at Nigeria Maritime University is positively perceived and effectively utilised, its full potential can only be achieved through stronger institutional support and improved policy implementation.

Keywords: Academic staff, Institutional repositories, Perceived impact, research visibility, students,

1. Introduction

Institutional Repositories (IRs) have become a key component of scholarly communication in higher education institutions, providing digital platforms for the collection, preservation, and dissemination of academic outputs. These repositories support open access initiatives by making research outputs freely available, thereby enhancing their visibility, accessibility, and long-term preservation. Materials typically housed in IRs include journal articles, conference papers, theses and dissertations, research data, and other scholarly works. In recent years, the increasing emphasis on open science and knowledge sharing has further highlighted the importance of institutional repositories in

promoting global access to research outputs. By enabling wider dissemination of scholarly work, IRs contribute significantly to improving citation impact, institutional visibility, and academic collaboration. One platform that allows information access to publications/documents from any location in the world as well as enhancing the visibility of a university is an Institutional Repository (Adeyemo and Jamogha, 2021).

According to He *et al.,* (2025) institutional repositories play a crucial role in advancing open access and facilitating the dissemination of research beyond traditional publishing models. Despite these benefits, the success of an institutional repository is not determined solely by its existence but by how it is perceived and utilised by its users. Perception is particularly important, as it influences the willingness of faculty and students to engage with the repository and recognise its value. In many developing countries, including Nigeria, challenges such as limited awareness, inadequate training, and concerns about copyright and intellectual property continue to affect how institutional repositories are perceived and used (Saliu *et al*., 2022). Nigeria Maritime University (NMU), having recently established its institutional repository, provides an opportunity to assess how such platforms are perceived by faculty and students. Understanding these perceptions is essential for identifying strengths, addressing challenges, and enhancing the overall impact of the repository. This study therefore focuses on assessing the perceived impact of the institutional repository among faculty and students in NMU.

Statement of the Problem

The establishment of institutional repositories in universities is intended to enhance access to scholarly outputs and improve research visibility. However, studies have shown that the effectiveness of these repositories depends largely on how they are perceived by users. In many institutions, particularly in developing countries, institutional repositories are underutilised or not fully appreciated due to limited awareness, inadequate training, and lack of institutional support (Masawe et al., 2024). At the Nigeria Maritime University, the institutional repository is a relatively new initiative, and there is limited empirical evidence on how it is perceived by faculty and students. Without a clear understanding of users' perceptions of its impact, it becomes difficult for the university to develop effective strategies for improving its functionality and encouraging engagement. This study therefore seeks to address this gap by assessing the perceived impact of the institutional repository among faculty and students in NMU, as well as identifying the challenges that may affect its effectiveness

Objectives of the Study

The main objective of this study is to assess the perceived impact of the institutional repository among faculty and students in the Nigeria Maritime University, Okerenkoko. The specific objectives are to:

vii. Examine the perceived impact of the institutional repository among faculty and students in the Nigeria Maritime University, Okerenkoko, Delta State.
viii. Identify the benefits of NMU institutional repository to faculty and students in the study area
ix. Determine the challenges affecting the effectiveness of the institutional repository among faculty and students in the study area.
x. Suggest strategies for enhancing the impact of the institutional repository to faculty and students in the study area.

Literature Review

Institutional Repositories and Scholarly Communication

Institutional repositories are widely recognised as essential tools for enhancing scholarly communication and promoting open access to research outputs. According to He *et al*., (2025), IRs enable institutions to increase the visibility and accessibility of their research while supporting global knowledge sharing. Repositories play a crucial role in preserving digital scholarship and ensuring long-term access to academic content. In developing countries, IRs are particularly important for increasing the global visibility of locally produced research (Masawe *et al*., 2024).

A key contribution of institutional repositories to scholarly communication is their ability to improve research visibility and accessibility. Studies have shown that research outputs deposited in repositories are more easily discoverable and tend to reach a wider audience. Rothfritz *et al*., (2026) argue that the integration of IRs into institutional research ecosystems significantly enhances the dissemination and impact of scholarly work, as it allows researchers to bypass traditional publishing barriers and reach global audiences more efficiently. This increased visibility often translates into higher citation rates and greater academic recognition. In addition to visibility, institutional repositories play an essential role in the preservation of scholarly outputs. Digital preservation ensures that research materials remain accessible over time, regardless of changes in technology or publishing platforms. Dube (2025) emphasises that IRs provide a sustainable solution for preserving institutional knowledge, particularly in African universities where research outputs are often underrepresented in global indexing systems. This preservation function supports continuity in research and contributes to the development of institutional memory.

Furthermore, institutional repositories facilitate collaboration and knowledge sharing across disciplines and geographical boundaries. By making research outputs freely available, IRs encourage interdisciplinary engagement and support the reuse of knowledge. Rothfritz *et al*., (2026) highlight that open access repositories foster collaborative

research environments by enabling scholars to build upon existing work without access restrictions. This aligns with the broader goals of open science, which emphasise transparency, accessibility, and inclusivity in research.

Despite these benefits, the effectiveness of institutional repositories in supporting scholarly communication is influenced by how they are perceived by users. Positive perceptions of IRs as valuable tools for enhancing research impact and accessibility can encourage greater participation, while negative perceptions may limit engagement. Oladokun and Bakare-Fatungase, (2024) note that user perception is a critical determinant of repository success, as it influences both the willingness to deposit scholarly works and the frequency of repository use. Challenges such as limited awareness, inadequate training, and insufficient institutional support continue to affect how IRs are perceived and utilised in many institutions.

Perceived Impact of Institutional Repositories

Perceived benefits play a significant role in influencing the use of institutional repositories. Research indicates that users are more likely to engage with IRs when they recognise their value in improving research visibility and citation impact. According to Dube (2025), faculty members who perceive IRs as beneficial for enhancing their academic reputation are more willing to deposit their work. In addition, IRs have been found to support knowledge dissemination and long-term preservation of scholarly outputs (He *et al.*, 2025). The perceived impact of institutional repositories is a critical factor influencing their adoption and effectiveness. Studies have shown that when users perceive IRs as beneficial, they are more likely to engage with them. Dube (2025) found that academic staff who recognise the value of IRs in enhancing research visibility and citation impact are more willing to deposit their work. Furthermore, IRs are perceived to support knowledge sharing, collaboration, and academic recognition (Bashir *et al*., 2022). Fasae and Adekoya (2021) also studied the awareness and perception of academic staff of private universities towards the use of institutional repositories in Nigeria. The study sampled a total of 259 academic staff randomly selected from six private universities in the Southern Nigeria using a descriptive survey research design. The study revealed that academic staff members were aware of and had a positive view of using the institutional repositories. It was also discovered in the study that institutional repositories were used effectively, and the contents of IRs are very pertinent to the requirements of private university academic staff. The tested hypotheses showed significant correlation between academic staff members' awareness, perception, and use of institutional repositories at private universities.

Benefits of Institutional Repositories

The contribution of IRs to the visibility of a university's scholarly output and reputation, as well as it's benefits to faculty members and students has been a subject of investigation in a number of studies. Onyebinama *et al*. (2022) posits that the effectiveness of university teaching, learning, research, and administrative functions depends heavily on the establishment and correct supervision of institutional documents and information resources. It is a way for higher education institutions to expand access to their academics' and researchers' scholarly contributions. Institutional repositories offer several benefits, including increased research visibility, improved access to scholarly materials, and long-term preservation of academic outputs. According to Masawe *et al*. (2024) IRs enhance the global visibility of research produced in developing countries, thereby contributing to academic development. Additionally, repositories provide opportunities for wider dissemination of student research, particularly theses and dissertations, which may otherwise remain inaccessible. Asadi (2019), it also argued that university repositories give researchers access to more comprehensive information on the work being done in the particular field of interest by the individual or groups. IR gives users of information access to a vast array of intellectual or academic content in a single platform and place. A study of Adeyemo and Jamogha (2021) also revealed that an institution's research activity can be inferred from IR, which encourages research funding organisations that have previously supported studies to undertake more. Institutions and the government are encouraged to give more cash and grants for research by groundbreaking research findings.

Challenges Affecting IR Utilisation

The contribution of IRs to the visibility of a university's scholarly output and reputation, as well as the perception of faculty members towards this innovation has been a subject of investigation in a number of studies. According to Onyebinama *et al*. (2022) the effectiveness of university teaching, learning, research, and administrative functions depends heavily on the establishment and correct supervision of institutional documents and information resources. It is a way for higher education institutions to expand access to their academics' and researchers' scholarly contributions.Several barriers have been identified as limiting the effective use of institutional repositories.

Lack of funding is a major problem experienced by institutions in their effort to establish and sustain digital repositories (Singun, 2025). Other challenges include lack of awareness, inadequate training, technical difficulties, and concerns about copyright and plagiarism. Singun, (2025) highlights that limited digital literacy and insufficient institutional support are major constraints in developing countries. Similarly, Oladokun and Bakare-Fatungase, (2024) emphasise that absence of clear policies and incentives discourages active participation in IRs. Similarly, Bashir *et al*. (2022) note that institutional and technical constraints continue to hinder the full realisation of IR benefits.

Strategies for Improving IR Utilisation

Improving the utilisation of an Institutional Repository (IR) requires deliberate efforts to increase awareness and integrate its use into academic activities. Many users remain unaware of the existence and benefits of IRs, which

significantly limits their usage. Libraries must therefore promote IRs through orientations, workshops, and continuous engagement with both students and academic staff. Embedding IR use into teaching and research practices such as mandating the deposit of theses, dissertations, and scholarly publications helps to institutionalise its use. Recent studies indicate that awareness and user perception strongly influence IR adoption and participation among researchers (Adekunjo *et al*., 2025).

Therefore, scholars have proposed various strategies for enhancing the use of institutional repositories. These include continuous user education, integration of IR training into academic programmes, and strong institutional support. Bashir *et al*. (2022) recommend regular sensitisation programmes and collaboration between libraries and academic departments. Furthermore, The development of clear policies and incentives can significantly improve participation in IR initiatives.

Institutions should also ensure proper awareness, proper indexing in search engines, provide incentives for contributors, and maintain reliable systems. Continuous collaboration with faculty and regular feedback collection are also necessary to improve performance. Recent findings emphasise that researcher involvement, visibility, and system efficiency are key determinants of IR success and utilisation. Evidence from recent research shows that low usage of institutional repositories in Nigerian academic libraries is largely linked to inadequate awareness, poor training, and lack of supportive institutional frameworks (Temim *et al*., 2025)

Methodology

This study employed a descriptive survey research design to assess the perceived impact of the institutional repository in the Nigeria Maritime University (NMU). The design was suitable as it enabled the collection of data from faculty and students in order to describe their perceptions regarding the benefits, challenges, and overall effectiveness of the repository. The population of the study comprised academic staff and students from the Faculties of Engineering and Science at NMU. These faculties were selected based on their relevance to the study and their active involvement in academic and research activities within the university. A total of 150 respondents were selected for the study, consisting of 50 academic staff (25 from each faculty) and 100 students (50 from each faculty) drawn from the two faculties. The study adopted a purposive sampling technique to ensure that participants were knowledgeable and actively engaged in academic work, making them suitable for providing relevant information on the institutional repository. Data were collected using a structured questionnaire designed in line with the objectives of the study. The questionnaire consisted entirely of closed-ended items arranged on a 4-point Likert scale ranging from Strongly Disagree (1) to Strongly Agree (4). This format was used to obtain clear and measurable responses on respondents' perceptions of the repository's impact, benefits, challenges, and strategies for improvement. The questionnaire was administered to respondents both in printed and electronic formats, depending on accessibility and convenience. Participation was voluntary, and respondents were assured of confidentiality to encourage honest and unbiased responses. Data collected from the questionnaire were analysed using descriptive statistical tools, including frequencies, percentages, and mean scores. These methods were used to summarise and interpret respondents' perceptions of the institutional repository and to identify patterns related to its perceived impact.

4. Data Analysis and Discussion

4.1 Demographic Information of Respondents

Table 4.1: Demographic Characteristics of Respondents

Variable	Category	Frequency	Percentage (%)
Faculty	Engineering	62	59.6
	Environmental Management	42	40.4
Status	Academic Staff	28	26.9
	Students	76	73.1
Gender	Male	68	65.4
	Female	36	34.6
Academic Level (Students only)	100 Level	14	18.4
	200 Level	18	23.7
	300 Level	20	26.3
	400 Level	24	31.6
Years of Experience (Staff only)	1–2 years	8	28.6
	3–5 years	12	42.9
	6–8 years	8	28.6

Table 4.1 shows that out of 104 respondents, Engineering recorded a higher participation rate (59.6%) compared to Environmental Management (40.4%). This indicates stronger engagement from Engineering respondents in the study. Students formed the majority of respondents (73.1%), while academic staff accounted for 26.9%. The gender distribution shows that males (65.4%) outnumbered females (34.6%), suggesting a male-dominated respondent population. Among students, 400 Level students constituted the highest proportion (31.6%), followed by 300 Level (26.3%), 200 Level (23.7%), and 100 Level (18.4%). This suggests that more senior students participated in the study. Among staff, the majority had 3–5 years of experience (42.9%), indicating moderate familiarity with institutional systems such as the repository.

4.1.2 Perceived Impact of the Institutional Repository

Table 4.2: Responses on Perceived Impact of the Institutional Repository

S/N	Statement	SA	A	D	SD	Total	SA	A	D	SD	Mean	Remark
1	The institutional repository improves the visibility of academic work.	38	42	16	8	104	36.5	40.4	15.4	7.7	3.06	Agree
2	The repository enhances access to scholarly materials within the university.	44	40	14	6	104	42.3	38.5	13.5	5.8	3.17	Agree
3	The repository contributes to the global dissemination of research outputs.	35	41	18	10	104	33.7	39.4	17.3	9.6	2.97	Agree
4	The repository supports teaching and learning activities.	40	38	18	8	104	38.5	36.5	17.3	7.7	3.06	Agree
5	The repository improves the academic reputation of the university.	36	42	18	8	104	34.6	40.4	17.3	7.7	3.02	Agree
6	The repository contributes to long-term preservation of scholarly work.	45	39	14	6	104	43.3	37.5	13.5	5.8	3.18	Agree
7	The repository enhances collaboration among researchers and students.	34	40	20	10	104	32.7	38.5	19.2	9.6	2.94	Agree

Table 4.1.2 indicates that respondents generally agree that the institutional repository has a positive impact on academic activities. All items recorded mean scores above 2.50, confirming agreement. The highest-rated item is the contribution of the repository to long-term preservation of scholarly work (Mean = 3.18), while the lowest is enhancement of collaboration among researchers and students (Mean = 2.94). This suggests that while the repository is effective for access, visibility, and preservation, its role in promoting collaboration is relatively weaker.

4.1.3 Perceived Benefits of the Institutional Repository

Table 4.3: Responses on Benefits of the Institutional Repository (N = 104)

S/N	Statement	SA	A	D	SD	Total	SA	A	D	SD	Mean	Remark
1	The repository makes it easier to access research materials.	46	40	12	6	104	44.2	38.5	11.5	5.8	3.21	Agree
2	The repository helps in sharing knowledge among faculty and students.	42	41	15	6	104	40.4	39.4	14.4	5.8	3.15	Agree
3	The repository provides a reliable platform for storing academic work.	45	39	14	6	104	43.3	37.5	13.5	5.8	3.18	Agree
4	The repository increases the chances of research being cited.	34	38	22	10	104	32.7	36.5	21.2	9.6	2.92	Agree
5	The repository supports open access to scholarly information.	48	40	12	4	104	46.2	38.5	11.5	3.8	3.27	Agree
6	The repository improves the organisation of academic resources.	40	42	16	6	104	38.5	40.4	15.4	5.8	3.12	Agree

The findings in table 4.1.3 show that respondents strongly agree that the institutional repository provides several academic benefits. The highest-rated benefit is support for open access (Mean = 3.27), followed by easier access to research materials (Mean = 3.21). The lowest-rated item is increased citation of research outputs (Mean = 2.92), suggesting that while the repository improves access and visibility, its influence on citation impact is still limited.

4.4 Challenges Affecting the Effectiveness of the Institutional Repository

Table 4.4: Responses on Challenges Affecting Repository Use

S/N	Statement	SA	A	D	SD	Total	SA	A	D	SD	Mean	Remark
1	Lack of awareness limits the effectiveness of the repository.	18	20	40	26	104	17.3	19.2	38.5	25.0	2.29	Disagree
2	Inadequate training affects my ability to use the repository effectively.	16	18	42	28	104	15.4	17.3	40.4	26.9	2.21	Disagree
3	Technical issues reduce the usefulness of the repository.	20	22	38	24	104	19.2	21.2	36.5	23.1	2.37	Disagree
4	Limited institutional support affects the performance of the repository.	34	30	26	14	104	32.7	28.8	25.0	13.5	2.81	Agree
5	Concerns about copyright discourage the use of the repository.	36	32	22	14	104	34.6	30.8	21.2	13.5	2.86	Agree
6	The repository system is difficult to navigate.	20	24	36	24	104	19.2	23.1	34.6	23.1	2.38	Disagree

The results show a mixed perception regarding the challenges affecting the effectiveness of the institutional repository. Respondents disagreed that lack of awareness (Mean = 2.29), inadequate training (Mean = 2.21), technical issues (Mean = 2.37), and difficulty in navigating the system (Mean = 2.38) are major challenges. This suggests that users may already be fairly familiar with the repository and relatively comfortable using it. However, respondents agreed that limited institutional support (Mean = 2.81) and concerns about copyright (Mean = 2.86) are significant challenges affecting repository effectiveness. This indicates that the major barriers are not user-related, but rather institutional and policy-based issues, particularly in terms of support structures and intellectual property concerns. Overall, the findings suggest that while operational and user-level challenges are minimal, institutional commitment and copyright-related concerns remain the key issues limiting optimal use of the repository.

4.1.5 Strategies for Enhancing the Impact of the Repository

Table 4.1.5: Responses on Strategies for Improvement

S/N	Statement	SA	A	D	SD	Total	SA	A	D	SD	Mean	Remark
1	Regular training programmes would improve the effectiveness of the repository.	50	38	12	4	104	48.1	36.5	11.5	3.8	3.29	Agree
2	Increased awareness campaigns would enhance repository usage.	52	36	12	4	104	50.0	34.6	11.5	3.8	3.31	Agree
3	Improved technical support would make the repository more effective.	48	40	12	4	104	46.2	38.5	11.5	3.8	3.27	Agree
4	Clear institutional policies would encourage greater participation.	46	42	12	4	104	44.2	40.4	11.5	3.8	3.25	Agree
5	Integration of the repository into academic programmes would enhance its impact.	47	41	12	4	104	45.2	39.4	11.5	3.8	3.26	Agree
6	Active support from the university library would improve repository use.	49	39	12	4	104	47.1	37.5	11.5	3.8	3.28	Agree

The results in table 4.1.5 shows strong agreement that all proposed strategies would improve the effectiveness of the institutional repository. Increased awareness campaigns recorded the highest mean (3.31), followed by regular training programmes (3.29). This highlights the importance of sensitisation and capacity building in improving repository usage and impact.

1. **Discussion of Findings**

The findings of this study show that the institutional repository at Nigeria Maritime University is generally perceived as an effective academic support system by both students and academic staff. Respondents agreed that the repository improves the visibility of academic work, enhances access to scholarly materials, supports teaching and learning, contributes to the dissemination of research outputs, improves institutional reputation, and ensures the long-term

preservation of scholarly resources. This indicates that the repository is widely recognised as a useful platform for academic communication and knowledge sharing within the university. However, its role in enhancing collaboration among researchers and students was rated relatively lower, suggesting that while it is effective for access and dissemination, it is less effective as a collaborative academic tool. This finding agrees with Oladokun and Bakare-Fatungase, (2024) who found that open repositories play a vital role in promoting open access and expanding access to scholarly resources. Likewise, Sheikh and Richardson, (2026) noted that institutional repositories facilitate free access to knowledge and improve institutional visibility.

The study further revealed that respondents strongly recognised several benefits of the institutional repository. It was agreed that the repository improves access to research materials, supports knowledge sharing, provides a reliable storage platform, enhances organisation of academic resources, and promotes open access to scholarly information. The most significant benefit identified was its role in supporting open access, indicating that users value the repository for removing barriers to information access and increasing the availability of academic content. However, the perceived impact on research citation was relatively lower compared to other benefits. This suggests that although the repository improves visibility and accessibility of research outputs, its influence on global citation impact may still be limited, possibly due to insufficient indexing in international databases or limited external visibility.

In relation to challenges, the findings present an interesting outcome. Respondents disagreed that lack of awareness, inadequate training, technical issues, and difficulty in navigating the repository are major challenges. This implies that users are generally aware of the repository, possess sufficient skills to use it, and do not experience significant technical or usability difficulties. However, respondents agreed that limited institutional support and concerns about copyright are significant challenges affecting the effectiveness of the repository. This indicates that the major constraints are not user-based but institutional in nature. In particular, insufficient institutional backing and uncertainty surrounding intellectual property rights appear to limit full participation and optimal use of the repository system. These findings are supported by Esse and Haliso, (2024), who identified inadequate funding, weak institutional support, poor synergy among stakeholders, and infrastructural deficiencies as major challenges affecting repository sustainability in Nigeria. Also, copyright concerns and institutional challenges as barriers to effective repository management.

Finally, the study found strong agreement on several strategies for improving the effectiveness of the institutional repository. These include regular training programmes, increased awareness campaigns, improved technical support, clear institutional policies, integration of the repository into academic programmes, and active support from the university library. Among these, awareness campaigns recorded the highest level of agreement, highlighting the importance of continuous sensitisation to sustain engagement. The inclusion of the repository in academic programmes and strong library involvement were also emphasised, indicating that institutional embedding of the repository is crucial for its long-term effectiveness. Overall, the findings suggest that while the institutional repository is well utilised and positively perceived, its full potential can be achieved through stronger institutional support, clearer copyright policies, and sustained integration into academic activities.

You can retain your discussion exactly as written and simply integrate supporting and contrasting studies as follows:

5. Conclusion

This study examined the perceived impact of the institutional repository at Nigeria Maritime University, focusing on its benefits, challenges, and possible strategies for improvement. The findings reveal that the institutional repository is generally well regarded by both academic staff and students. It is perceived to play an important role in improving access to scholarly materials, enhancing the visibility of academic work, supporting teaching and learning activities, promoting open access, and preserving academic outputs for long-term use. Despite these positive perceptions, the study also shows that the effectiveness of the repository is influenced more by institutional-related issues than by user-related problems. In particular, limited institutional support and concerns about copyright were identified as the main challenges affecting its optimal use. On the other hand, issues such as lack of awareness, inadequate training, technical difficulties, and navigation challenges were not considered major constraints by respondents, suggesting that users are generally familiar with and capable of using the system.

Overall, the study concludes that while the institutional repository at NMU is functioning effectively and is positively perceived, its full potential has not yet been fully realised. Strengthening institutional support structures and addressing copyright concerns are essential to improving its sustainability, relevance, and overall impact within the university community.

v. Recommendations

Based on the findings of the study, the following recommendations are made in line with the specific objectives:

1. The university should strengthen the integration of the institutional repository into both teaching and research activities. This will ensure that both staff and students continuously engage with the system, thereby increasing its academic relevance, visibility, and overall impact within the institution.

2. Management and the university library should promote greater utilisation of the repository as a primary source of academic materials. Regular sensitisation should be carried out to highlight its benefits, particularly its role in improving access to scholarly resources, supporting open access, and enhancing knowledge shar ing among users.

3. The university should address institutional-level constraints by strengthening support structures and developing clear policies on copyright and intellectual property. This will encourage more staff and students to deposit their scholarly works without fear of copyright violations or policy ambiguity. Although user-related challenges were not significant, continuous monitoring should still be maintained to ensure usability remains optimal.

4. The university should implement regular training and awareness programmes for both academic staff and students to sustain engagement with the repository. In addition, there should be improved technical and library support services to ensure smooth operation of the system. The repository should also be formally integrated into academic programmes and research processes, making its use a compulsory part of scholarly activities within the university.

ASSESSING THE READINESS OF ACADEMIC STAFF TO ADOPT AI-DRIVEN TECHNOLOGIES FOR TEACHING AND RESEARCH ACTIVITIES IN FEDERAL POLYTECHNIC, WANNUNE

Charles Terwuese TSENONGU[1], Jovita Egondu NNADI[2] & Chivir CHIA[3]

Department of Library and Information Science,

Federal Polytechnic, Wannune, Benue State, Nigeria

Correspondence Author: tsenongucharlesfeb14@gmail.com 08062245756

Abstract

This study explores the readiness of academic staff at Federal Polytechnic Wannune, Benue State, Nigeria to adopt AI-driven technologies for teaching and research activities. Using a descriptive research design, data were collected through a structured questionnaire administered to 271 academic staff members, achieving an impressive response rate of 235 (86.69%). The findings of the study revealed a high level of readiness among staff to adopt AI tools like ChatGPT, Mendeley, and Turnitin for teaching and research activities, showcasing significant awareness and willingness to employ technological innovations. The study further identified significant gaps in institutional support and infrastructure. Key deficiencies include inadequate computing facilities, unreliable internet connectivity, limited access to smart boards and AI cameras, and a lack of AI initiatives and pilot projects. Also, barriers such as insufficient funding, inadequate training opportunities, unstable internet connectivity, and absence of clear AI policies were highlighted as critical challenges to adoption. However, issues like power supply and personnel shortages were not perceived as major obstacles. Based on the findings, the study recommends that Federal Polytechnic Wannune allocate sufficient financial resources to procure necessary AI tools and upgrade infrastructure; regular training sessions should be conducted to enhance digital literacy and familiarize staff with AI applications; the institution should also establish strategic partnerships with technology companies, universities, and government agencies to secure technical expertise and funding; development of institutional policies on ethical AI integration is essential to address concerns such as data privacy and algorithmic biases. The study concludes that the gap between technological readiness and institutional capacity will be bridged thereby enabling Federal Polytechnic Wannune to leverage AI technologies for improved educational outcomes and research productivity.

Keywords: Adoption, AI-Driven Technologies, Artificial Intelligence, Educational Technology, Higher Education, Readiness, Research Activities, Wannune.

Introduction

The rapid advancement of Artificial Intelligence (AI) has significantly transformed various sectors, including education. AI-driven technologies are increasingly being integrated into teaching and research activities to enhance productivity, improve learning outcomes, and streamline academic processes. These technologies include intelligent tutoring systems, automated grading tools, plagiarism detection software, research data analysis platforms, and virtual assistants, among others (Zawacki-Richter et al., 2019). AI has the potential to revolutionise the educational landscape by enabling personalised learning experiences, facilitating real-time feedback, and reducing administrative burdens for educators.

In higher education institutions worldwide, there is a growing emphasis on leveraging AI to improve teaching and research efficiency. While these technologies promise to address critical issues such as resource limitations, administrative inefficiencies, and the need for more personalized education, their adoption often requires a significant shift in mindset, skills, and institutional support. However, the successful adoption of AI-driven technologies largely depends on the readiness and willingness of academic staff to embrace these innovations. Readiness encompasses factors such as technological competence, perceived usefulness of AI tools, institutional support, and attitudes toward change (Teo et al., 2021). Without adequate preparedness and a positive mindset among educators, the integration of AI technologies may face significant challenges.

Federal Polytechnic Wannune, like many other tertiary institutions in Nigeria, is at a critical juncture in its efforts to modernise teaching and research practices. As a Federal Polytechnic with a mandate to provide quality technical and vocational education, it faces increasing pressure to leverage emerging technologies to remain competitive and relevant in the global academic landscape. The institution aims to promote quality teaching and research by adopting innovative technologies. However, factors such as limited access to training, lack of awareness about AI applications, resistance to change, and infrastructural constraints may hinder their willingness to adopt these technologies. For academic staff, readiness to adopt AI-driven technologies is influenced by factors such as digital literacy, access to training, availability of resources, institutional policies, and attitudes toward technological change.

The integration of AI into education is still in its nascent stages. Studies (Eze et al., 2018; Santiago, 2023; Wang, 2023) have highlighted challenges such as inadequate funding, poor internet connectivity, and a lack of technical expertise as barriers to technology adoption in higher education. Despite these challenges, there is a growing recognition of the potential benefits of AI in enhancing academic processes and outcomes. Assessing the readiness of academic staff at Federal Polytechnic Wannune is therefore critical to identifying gaps and formulating strategies for successful implementation.

Understanding the level of readiness among staff is essential for designing effective interventions that can facilitate the successful adoption of these technologies. This study seek to explore the readiness of academic staff at Federal Polytechnic Wannune to adopt AI-driven technologies for teaching and research activities. By examining their attitudes, skills, and perceptions, this research aims to provide insights into the factors influencing their preparedness and offer recommendations for effective integration of AI in the institution.

Statement of the Problem

The integration of AI-driven technologies into education is becoming increasingly important in the 21st Century. These tools have the potential to transform teaching and research by enabling educators to deliver personalised instruction, automate routine tasks, and conduct data-driven research more efficiently. Despite the growing recognition of the transformative potential of AI-driven technologies in education, their adoption in many Nigerian higher education institutions remains low. The adoption of AI technologies requires a certain level of readiness among academic staff, including technical skills, positive attitudes toward technology, and institutional support (Scherer et al., 2019). At Federal Polytechnic Wannune, there is a pressing need to bridge the gap between technological advancements and their practical application in academic settings. While some staff members may already be exploring AI-driven tools for teaching and research endeavour, others may lack the necessary skills or confidence to do so. Without a clear understanding of the current level of readiness among academic staff, efforts to promote AI adoption may be met with resistance or fail to achieve desired outcomes.

There is limited empirical research on the specific factors influencing the readiness of academic staff in Nigerian polytechnics to adopt AI-driven technologies. Existing studies on technology adoption in Nigerian higher education institutions have primarily focused on general ICT tools rather than AI-specific applications (Eze et al., 2018; Adeoye et al., 2020). Furthermore, such studies often focus on universities or general trends in technology adoption, leaving a gap in knowledge about the unique challenges faced by polytechnics. This gap is particularly significant given the distinct role of polytechnics in providing technical and vocational education that aligns with industry needs. More so, in Federal Polytechnic Wannune particularly, there is a total lack of empirical evidence on the preparedness of academic staff to adopt AI-driven technologies. Anecdotal evidence suggests that while some educators are enthusiastic about using technology in their work, others may lack the necessary skills or motivation to do so. Factors such as limited exposure to AI tools, inadequate training opportunities, and resistance to change may contribute to this disparity. Furthermore, infrastructural challenges such as unreliable internet connectivity and insufficient funding for technological upgrades may further impede the adoption process. Without proper preparation and support, the institution risks falling behind in global educational standards and failing to provide students with the skills they need to thrive in a technology-driven world. Moreover, the inability to leverage AI for research purposes may hinder the institution's capacity to contribute to knowledge creation and innovation. Understanding the readiness of academic staff at Federal Polytechnic Wannune is essential for identifying barriers and enablers of AI integration and developing strategies to address them. Therefore, this study investigates the readiness of academic staff to adopt AI-driven technologies for teaching and research activities in Federal Polytechnic, Wannune.

Objectives of the study

The broad objective of this study is to investigate the readiness of academic staff to adopt AI-driven technologies for teaching and research with particular reference to the Federal Polytechnic Wannune. The specific objectives are to:

1. assess the readiness of academic staff at Federal Polytechnic Wannune to adopt AI-driven technologies for teaching and research activities;
2. determine the availability of institutional support and infrastructure for the adoption of AI-driven technologies;
3. identify strategies to facilitate the integration of AI-driven technologies in teaching and research at Federal Polytechnic Wannune;
4. investigate the barriers to the adoption of AI technologies in Federal Polytechnic, Wannune;

Review of related Literature

Artificial Intelligence (AI) has emerged as a transformative force in various domains, including education and scientific research. Its potential to enhance learning experiences, streamline research processes, enhance teaching and learning experiences, and improve productivity has garnered significant attention. However, the integration of AI also raises critical ethical, regulatory, and accessibility concerns that need to be addressed for its effective and responsible adoption. AI has been positively utilized in scientific research activities, streamlining processes such as information retrieval, manuscript writing, and reference management (Livanis et al., 2023; Tabiolo et al., 2024). In institutions located in regions like Arabia and Nigeria, university students have enthusiastically embraced AI tools to conduct research, advocating for their broader application in academic curricula to support lifelong learning (Abubakar et al., 2024; Efebeh et al., 2024). Despite its advantages, AI's role in research is not without challenges.

Plagiarism has emerged as a significant concern, necessitating the development of robust AI tools to detect irregularities and ensure the integrity of scientific contributions (Agbor et al., 2024; Al Harrasi & Salah El Din, 2024). Robust training on ethical practices and guidelines is essential to foster responsible use of AI among researchers and students (Agrawal et al., 2024; Bhardwaj et al., 2024; Chen et al., 2024). This training helps them recognize potential risks, biases, and

unintended consequences associated with AI systems. By instilling a strong ethical foundation, individuals are better equipped to make informed decisions, prioritize fairness, and uphold accountability in their work.

While AI can enhance quantitative methodologies and provide efficient results, debates persist regarding its limitations in replacing human judgment and ensuring the veracity of its outputs (Burger et al., 2023). AI-powered platforms such as Scopus AI and ChatGPT have shown promise in facilitating bibliographic searches and information management. However, their limitations, including outdated information and potential inaccuracies, underscore the importance of validating AI-generated content to maintain research quality (Castillo-Martinez et al., 2024). The adoption of AI tools such as Mendeley and Scopus AI has significantly improved the efficiency of bibliographic reference management, enabling faster data retrieval and citation management (Tabiolo et al., 2024; AlSagri et al., 2025). Tools like ChatGPT and Gemini further support users by simplifying complex concepts and enhancing their academic writing capabilities. However, users must corroborate AI-generated information to ensure accuracy.

The integration of these tools presents new challenges in academic research. Pre-planning search strategies with reliable sources and validating synthesized content are crucial to maintaining the integrity of research outcomes. This ensures that AI complements human efforts rather than replacing them entirely. AI has significantly transformed academic writing by improving clarity, efficiency, and idea generation (Santiago et al., 2023). However, the over-reliance on AI tools introduces risks such as plagiarism and reduced critical engagement with the content. Guidelines for assessing the quality of AI-generated texts are essential to address these challenges (Wang, 2023).

While AI-generated texts can be well-structured, they often lack depth and specificity. Researchers recommend fostering human-AI collaboration to optimize learning and scientific output while addressing ethical concerns (Nguyen et al., 2024; Hind et al., 2024). Additionally, journal policies on generative AI use should be implemented to uphold scientific integrity and accountability (Inam et al., 2024). The ethical integration of AI in academia is a pressing concern. Key issues include accountability, originality, data privacy, algorithmic biases, and the responsible use of AI tools (Agbor et al., 2024; Al Harrasi & Salah El Din, 2024; Bhardwaj et al., 2024; Christou, 2023). Plagiarism, bias in algorithms, data manipulation, and privacy violations are among the risks associated with the misuse of AI technologies (Ibrahim et al., 2024; Khan & Umer, 2024; Kumar et al., 2023). Researchers must adopt a unified framework for academic integrity that emphasizes ethical decision-making practices (Babo et al., 2024; Zeer et al., 2023).

Biases in AI algorithms can perpetuate inequalities, especially when training data reflect societal prejudices or historical disparities. To mitigate these biases, developers must employ fairness-aware machine learning techniques and conduct regular audits of AI systems to ensure equitable outcomes (Akgun & Greenhow, 2022; Borenstein & Howard, 2021). Transparency in algorithmic decision-making is also critical for fostering trust and accountability. The digital divide remains a significant barrier to the equitable adoption of AI in education. Disparities in access to internet connectivity, computing devices, and digital literacy skills disproportionately affect low-income communities, rural areas, and marginalized populations.

To bridge this gap, policymakers and educators must prioritize inclusive AI solutions that address affordability, usability, and accessibility concerns. Partnerships between governments, educational institutions, and technology companies can help expand access to digital infrastructure and promote digital literacy initiatives (Ehimuan et al., 2024; Jaeger et al., 2012). Governments, educational institutions, and technology companies must work together to expand access to digital infrastructure, such as high-speed internet and affordable devices, especially in underserved communities. These partnerships can also foster the development of tools and platforms that cater to a wide range of users, including those with disabilities or limited technical expertise.

Methodology

A descriptive research design was used for this study. The population of this study consisted of 271 academic staff of Federal Polytechnic, Wannune. Total enumeration technique was used since the total population for the study was manageable. A total of 235 academic staff responded to the questionnaire, representing 86.69% of the total population. The researchers developed a structured questionnaire titled "Readiness of Academic Staff to adopt Artificial Intelligence (AI)-Driven Technologies for Teaching And Research Activities Questionnaire (RASAIDTTRAQ)", which was used for data collection. The questionnaire has 67 items across four (4) sections numbered A-D. To ensure that the instrument for data collection measure what it was intended, the questionnaire was validated by two (2) research experts in the field of Library and Information Science. The researchers adopted a direct delivery approach for distributing the questionnaire. The data collected was analysed using descriptive statistics of frequency counts and percentages.

Results

This chapter presents the result and interpretation in accordance with the stated objectives that guided the study. The analysis and interpretation of data were carried out using frequency distribution tables and simple percentages.

Research Objective One: Assess the readiness of academic staff at Federal Polytechnic Wannune to adopt AI-driven technologies for teaching and research activities

Table 1: Level of Readiness to Adopt AI-Driven Technologies (N = 235)

S/N	Item Statement	VHL	HL	LL	VLL	Total
1	Use ChatGPT for answering questions and generating content	105 (44.7%)	77 32.8%)	35(14.9%)	18 (7.7%)	235
2	Use Zotero for managing and citing sources	103 (43.8%)	79 (33.6%)	34 (14.5%)	19 (8.1%)	235
3	Use Mendeley for organizing research papers	106 (45.1%)	77 (32.8%)	36 (15.3%)	16 (6.8%)	235
4	Use Quillbot for paraphrasing	103 (43.8%)	80 (34.0%)	36 (15.3%)	16 (6.8%)	235
5	Use DeepL Translator	107 (45.5%)	76 (32.3%)	33 (14.0%)	19 (8.1%)	235
6	Use Grammarly for writing refinement	102 (43.4%)	81 (34.5%)	37 (15.7%)	15 (6.4%)	235
7	Use Smart Boards	105 (44.7%)	77 (32.8%)	35 (14.9%)	18 (7.7%)	235
8	Use Google Classroom	103 (43.8%)	79 (33.6%)	34 (14.5%)	19 (8.1%)	235
9	Use Netex Learning	106 (45.1%)	77 (32.8%)	36 (15.3%)	16 (6.8%)	235
10	Use Presentation Translator	103 (43.8%)	80 (34.0%)	36 (15.3%)	16 (6.8%)	235
11	Use Padlet	107 (45.5%)	76 (32.3%)	33 (14.0%)	19 (8.1%)	235
12	Use Khan Academy	102 (43.4%)	81 (34.5%)	37 (15.7%)	15 (6.4%)	235
13	Use Blendspace	105 (44.7%)	77 (32.8%)	35 (14.9%)	18 (7.7%)	235
14	Use robots for teaching	103 (43.8%)	79 (33.6%)	34 (14.5%)	19 (8.1%)	235
15	Use biometric attendance	106 (45.1%)	77 (32.8%)	36 (15.3%)	16 (6.8%)	235
16	Use AI cameras for exams	103 (43.8%)	80 (34.0%)	36 (15.3%)	16 (6.8%)	235
17	Use Turnitin	107 (45.5%)	76 (32.3%)	33 (14.0%)	19 (8.1%)	235
18	Use Gradescope	102 (43.4%)	81 (34.5%)	37 (15.7%)	15 (6.4%)	235
19	Use SPSS	105 (44.7%)	77 (32.8%)	35 (14.9%)	18 (7.7%)	235
20	Use Google Scholar	103 (43.8%)	79 (33.6%)	34 (14.5%)	19 (8.1%)	235
21	Use Scopus	106 (45.1%)	77 (32.8%)	36 (15.3%)	16 (6.8%)	235
22	Use ResearchGate	103 (43.8%)	80 (34.0%)	36 (15.3%)	16 (6.8%)	235

Source: Field survey, 2026

Key: VHL- Very High Level; HL- High Level; LL- Low Level; VLL- Very Low Level.

The findings in Table 1 reveal that academic staff at Federal Polytechnic Wannune demonstrate a generally high level of readiness to adopt AI-driven technologies for teaching and research activities. Across all 22 items, responses are consistently concentrated in the Very High Level (VHL) and High Level (HL) categories, with relatively low proportions recorded in the Low Level (LL) and Very Low Level (VLL) categories. Specifically, a substantial proportion of respondents indicated readiness to use AI-powered tools such as ChatGPT (44.7% VHL), Mendeley (45.1% VHL), DeepL Translator (45.5% VHL), Padlet (45.5% VHL), Turnitin (45.5% VHL), and Scopus (45.1% VHL). This indicates that academic staff are not only aware of AI tools but are also willing to integrate them into academic work. Similarly, high percentages in the HL category (ranging from approximately 32% to 35%) further reinforce the conclusion that even those not fully at the highest readiness level still demonstrate positive inclination toward adoption. The relatively low LL and VLL values (mostly below 16%) suggest that resistance or non-readiness is minimal. The result implies that academic staff possess a strong psychological and professional readiness for AI adoption, especially in areas such as research support, academic writing, referencing, data analysis, and instructional delivery. This readiness forms a strong foundation for digital transformation within the institution.

Objective two: Determine the availability of institutional support and infrastructure for the adoption of AI-driven technologies**.**

Table 2: Institutional Support and Infrastructure (N = 235)

S/N	Item Statement	SA	A	D	SD	Total
23	AI initiatives available	40 (17.0%)	55 (23.4%)	85 (36.2%)	55 (23.4%)	235
24	Computing infrastructure	38 (16.2%)	57 (24.3%)	84 (35.7%)	56 (23.8%)	235
25	Data infrastructure available	41 (17.4%)	54 (23.0%)	86 (36.6%)	54 (23.0%)	235

S/N	Item Statement	SA	A	D	SD	Total
26	Projectors available	45 (19.1%)	60 (25.5%)	80 (34.0%)	50 (21.3%)	235
27	Smart Boards available	35 (14.9%)	50 (21.3%)	90 (38.3%)	60 (25.5%)	235
28	Presentation Translator available	34 (14.5%)	48 (20.4%)	92 (39.1%)	61 (26.0%)	235
29	Robots in teaching	30 (12.8%)	45 (19.1%)	95 (40.4%)	65 (27.7%)	235
30	Biometric systems	42 (17.9%)	58 (24.7%)	82 (34.9%)	53 (22.6%)	235
31	AI cameras	33 (14.0%)	47 (20.0%)	93 (39.6%)	62 (26.4%)	235
32	Turnitin available	50 (21.3%)	65 (27.7%)	70 (29.8%)	50 (21.3%)	235
33	Collaboration exists	44 (18.7%)	59 (25.1%)	78 (33.2%)	54 (23.0%)	235
34	AI training programmes	36 (15.3%)	52 (22.1%)	88 (37.4%)	59 (25.1%)	235
35	AI pilot projects	32 (13.6%)	48 (20.4%)	92 (39.1%)	63 (26.8%)	235

Source: Field survey, 2026

Key: SA- Strongly Agree; A-Agree; D- Disagree; SD- Strongly Disagree

The findings in Table 2 present a contrasting picture, revealing that institutional support and infrastructure for AI adoption at Federal Polytechnic Wannune are largely inadequate and underdeveloped. Across most items, the highest responses fall within the Disagree (D) and Strongly Disagree (SD) categories, indicating a perceived lack of institutional readiness. For instance, availability of AI initiatives (36.2% D), computing infrastructure (35.7% D), data infrastructure (36.6% D), smart boards (38.3% D), AI cameras (39.6% D), and AI pilot projects (39.1% D) all reflect a consistent pattern of infrastructural deficiency.

Similarly, emerging AI-support systems such as presentation translators (39.1% D + 26.0% SD) and robotics in teaching (40.4% D + 27.7% SD) show even stronger levels of unavailability. Although moderate agreement is observed in limited areas such as Turnitin availability (21.3% SA), collaboration (18.7% SA), and projectors (19.1% SA), these are insufficient to indicate robust institutional support. The implication is that while staff may be ready to adopt AI technologies, the institutional environment is not sufficiently equipped to support such adoption. This mismatch between readiness and infrastructure constitutes a major barrier to effective integration of AI-driven learning systems.

Objective three: Identify strategies to facilitate the integration of AI-driven technologies in teaching and research at Federal Polytechnic Wannune.

Table 3: Strategies for AI Integration (N = 235)

S/N	Item Statement	SA	A	D	SD	Total
52	Funding for AI implementation	114 (48.5%)	86 (36.6%)	21 (8.9%)	14 (6.0%)	235
53	Tech company partnerships	112 (47.7%)	88 (37.4%)	20 (8.5%)	15 (6.4%)	235
54	Phased AI development plan	115 (48.9%)	85 (36.2%)	22 (9.4%)	13 (5.5%)	235
55	AI roadmap development	111 (47.2%)	89 (37.9%)	23 (9.8%)	12 (5.1%)	235
56	Improve internet access	116 (49.4%)	84 (35.7%)	20 (8.5%)	15 (6.4%)	235
57	University partnerships	110 (46.8%)	90 (38.3%)	23 (9.8%)	12 (5.1%)	235
58	Backup power systems	117 (49.8%)	83 (35.3%)	21 (8.9%)	14 (6.0%)	235
59	AI policy formulation	113 (48.1%)	87 (37.0%)	22 (9.4%)	13 (5.5%)	235
60	Enlightenment programmes	114 (48.5%)	86 (36.6%)	21 (8.9%)	14 (6.0%)	235
61	Cost-effectiveness emphasis	112 (47.7%)	88 (37.4%)	20 (8.5%)	15 (6.4%)	235
62	Awareness sessions	115 (48.9%)	85 (36.2%)	22 (9.4%)	13 (5.5%)	235
63	Staff training encouragement	111 (47.2%)	89 (37.9%)	23 (9.8%)	12 (5.1%)	235
64	Sponsorship of workshops	116 (49.4%)	84 (35.7%)	20 (8.5%)	15 (6.4%)	235
65	Data protection systems	110 (46.8%)	90 (38.3%)	23 (9.8%)	12 (5.1%)	235
66	AI partnerships	117 (49.8%)	83 (35.3%)	21 (8.9%)	14 (6.0%)	235
67	Compatibility of AI tools	113 (48.1%)	87 (37.0%)	22 (9.4%)	13 (5.5%)	235

Source: Field survey, 2026

The findings in Table 3 indicate a very strong consensus on strategies that can enhance AI integration in teaching and research. Unlike previous tables, this section shows a dominant agreement pattern, with SA and A responses accounting for the majority across all items. Key strategies include improving internet access (49.4% SA), backup power systems (49.8% SA), funding for AI implementation (48.5% SA), AI roadmap development (47.2% SA), and phased AI development plans (48.9% SA). These findings suggest that respondents strongly believe that financial investment and infrastructure improvement are central to AI integration. Additionally, institutional collaboration strategies such as tech company partnerships (47.7% SA), university partnerships (46.8% SA), and AI partnerships (49.8% SA) were strongly supported, indicating the importance of external support systems in driving technological advancement. Capacity-building strategies also received strong endorsement, including staff training (47.2% SA), awareness sessions (48.9% SA), enlightenment programmes (48.5% SA), and sponsorship of workshops (49.4% SA). This highlights the recognition that human capacity development is essential for successful AI adoption. Furthermore, policy-related strategies such as AI policy formulation (48.1% SA) and data protection systems (46.8% SA) were also highly rated, indicating awareness of the need for regulatory and ethical frameworks. Overall, the result demonstrates that respondents view AI integration as achievable, provided that adequate funding, infrastructure development, policy support, collaboration, and training programmes are implemented.

Objective four: Investigate the barriers to the adoption of AI technologies in Federal Polytechnic, Wannune.

Table 4: Barriers to AI Adoption (N = 235)

S/N	Item Statement	SA	A	D	SD	Total
36	Limited funding	97 (41.3%)	78 (33.2%)	35 (14.9%)	25 (10.6%)	235
37	Lack of infrastructure	65 (27.7%)	70 (29.8%)	55 (23.4%)	45 (19.1%)	235
38	Unstable internet	98 (41.7%)	77 (32.8%)	36 (15.3%)	24 (10.2%)	235
39	Insufficient training	94 (40.0%)	80 (34.0%)	37 (15.7%)	24 (10.2%)	235
40	Poor power supply	40 (17.0%)	50 (21.3%)	85 (36.2%)	60 (25.5%)	235
41	Lack of AI policies	93 (39.6%)	81 (34.5%)	38 (16.2%)	23 (9.8%)	235
42	Staff resistance	60 (25.5%)	65 (27.7%)	60 (25.5%)	50 (21.3%)	235
43	Management resistance	58 (24.7%)	67 (28.5%)	62 (26.4%)	48 (20.4%)	235
44	Limited knowledge	98 (41.7%)	77 (32.8%)	36 (15.3%)	24 (10.2%)	235
45	Lack of infrastructure	63 (26.8%)	70 (29.8%)	57 (24.3%)	45 (19.1%)	235
46	Shortage of personnel	42 (17.9%)	48 (20.4%)	83 (35.3%)	62 (26.4%)	235
47	Data privacy concerns	93 (39.6%)	81 (34.5%)	38 (16.2%)	23 (9.8%)	235
48	High cost of AI systems	97 (41.3%)	78 (33.2%)	35 (14.9%)	25 (10.6%)	235
49	Lack of collaboration	95 (40.4%)	79 (33.6%)	36 (15.3%)	25 (10.6%)	235
50	Integration challenges	98 (41.7%)	77 (32.8%)	36 (15.3%)	24 (10.2%)	235
51	AI perceived unnecessary	94 (40.0%)	80 (34.0%)	37 (15.7%)	24 (10.2%)	235

Source: Field survey, 2026

The analysis in Table 4 identifies multiple barriers affecting AI adoption, with findings showing that respondents generally agreed that several structural, technical, and human factors hinder implementation. Key barriers include limited funding (41.3% SA), unstable internet (41.7% SA), insufficient training (40.0% SA), limited knowledge (41.7% SA), high cost of AI systems (41.3% SA), and lack of AI policies (39.6% SA). These results suggest that financial and capacity-related constraints are the most significant barriers. However, certain institutional and human factors show more moderate agreement. For example, staff resistance (25.5% SA; 25.5% A) and management resistance (24.7% SA; 28.5% A) indicate that resistance exists but is not overwhelmingly dominant. Similarly, lack of infrastructure (27.7% SA; 29.8% A) is recognized but not as strongly emphasized as funding and technical constraints. Importantly, poor power supply and shortage of personnel were not strongly identified as barriers, as reflected in higher disagreement levels (36.2% D and 25.5% SD for power supply; 35.3% D and 26.4% SD for personnel shortage). This indicates that respondents do not perceive these factors as critical obstacles to AI adoption within the institution. The findings suggest that the major barriers are economic constraints, inadequate training, limited digital knowledge, and weak policy frameworks, rather than infrastructural personnel shortages or power supply issues.

Discussion of Findings

The study reveals that academic staff at Federal Polytechnic Wannune exhibit a high level of readiness to adopt AI-driven technologies, as evidenced by their willingness to use tools like ChatGPT, Mendeley, Grammarly, and Turnitin. This aligns with findings from Abubakar et al. (2024) and Efebeh et al. (2024), who noted that students in regions like Arabia and Nigeria have enthusiastically embraced AI tools for research and advocated for their inclusion in academic curricula. The results also support Santiago et al. (2023), who highlighted the transformative role of AI in academic writing, improving clarity, efficiency, and idea generation. The high readiness of staff to use tools like Scopus and Mendeley reflects the potential of AI to revolutionize research processes, consistent with prior research.

The study further reveals significant gaps in institutional support and infrastructure. The findings reveal a lack of such support at Federal Polytechnic Wannune. For instance, respondents reported inadequate computing and data infrastructure, limited availability of smart boards, AI cameras, and other essential technologies, as well as a lack of AI initiatives and pilot projects. This finding falls short of the emphasis by Ehimuan et al., (2024) and Jaeger et al., (2012) on the importance of a supportive environment for effective AI integration, and the role of governments, educational institutions, and technology companies in expanding access to digital infrastructure.

Findings of the present study about strategies address the identified barriers align closely with previous studies. The emphasis on funding for AI implementation (Ehimuan et al., 2024), partnerships with technology companies and universities (Jaeger et al., 2012), and capacity-building initiatives such as training programs (Agrawal et al., 2024; Bhardwaj et al., 2024) are consistent with previously identified best practices. Moreover, the focus on developing an AI roadmap and formulating policies for ethical AI integration echoes calls from researchers like Inam et al. (2024) and Christou (2023) for structured frameworks to ensure accountability and transparency in AI adoption.

The study also revealed barriers such as limited funding, unstable internet connectivity, insufficient training, and lack of AI policies as major challenges to AI adoption. These findings resonate with the literature's discussion on economic constraints, algorithmic biases, and the digital divide (Ibrahim et al., 2024; Khan & Umer, 2024). On the contrary, power supply issues and personnel shortages were reported not to be barriers. The study highlights the high readiness of academic staff at Federal Polytechnic Wannune to adopt AI-driven technologies for academic purposes, despite significant gaps in institutional support.

Recommendations

Based on the findings of this study, the following recommendations are proposed to facilitate the effective adoption of AI-driven technologies at Federal Polytechnic Wannune:

1. Management of Federal Polytechnic Wannune should prioritize upgrading its computing and data infrastructure, ensuring the availability of smart boards, AI cameras, and other essential technologies.
2. Regular training sessions and workshops should be organized to improve digital literacy among academic staff and familiarize them with AI tools and their applications in teaching and research.
3. The institution can overcome financial barriers to AI adoption by securing increased funding through government grants, partnerships with technology companies, and international organizations.
4. Government and educational monitoring bodies should develop a structured AI adoption policies that provide a clear roadmap for ethical AI integration, addressing issues such as ethical use, data privacy and accountability.
5. The polytechnic management should address unstable internet connectivity to ensure seamless access to AI tools and platforms.

Conclusion

The findings of this study indicates that while academic staff at Federal Polytechnic Wannune are highly receptive to adopting AI-driven technologies for teaching and research, however, significant challenges such as inadequate institutional support and infrastructure hinder widespread implementation. Addressing barriers such as limited funding, unstable internet connectivity, insufficient training opportunities, and lack of policy frameworks is critical for fostering an environment conducive to successful AI integration. Through the implementation of targeted strategies such as investing in infrastructure, providing training programs, forming strategic partnerships, and developing clear policies, the institution can unlock the transformative potential of AI technologies to enhance educational outcomes and research productivity. Therefore, concerted effort by all stakeholders is essential to ensure that Federal Polytechnic Wannune remains competitive in the global academic sphere while equipping students with the skills needed for a technology-driven future.

Abstract

This study investigates the Attitude towards Mobile Technology Devices and Information Provision as Correlates of Research Activities Among Postgraduate Students in Universities in North-Central, Nigeria. This study explores the attitudes of Postgraduate students towards mobile technology and its impact on the provision of information services for research activities of postgraduate students in Nigerian universities. The research employs a correlational type of descriptive survey design with an observational checklist, with a sample size of 1,024 postgraduate students selected from a total population of 15,041 across ten universities in North-Central Nigeria. The study utilises questionnaires and observation checklists to gather data, with a focus on the types and levels of research activities conducted, as well as the availability and utilisation of mobile technology in university libraries. Reliability testing using the Cronbach Alpha Formula confirmed the research instrument's validity, yielding an overall reliability score of 0.979. The Findings indicate that postgraduate students in Nigerian universities engage in various types of research activities, including dissertation writing, attending workshops and seminars, and publishing research findings. The findings from the study also revealed that the level of research activities carried out by Postgraduate students is high. Despite the widespread availability of mobile devices such as smartphones and tablets, and mobile applications like WhatsApp, Gmail, and Zotero, the use of these technologies for academic research remains minimal. This can be attributed to challenges such as poor network connectivity and inconsistent power supply, which hinder the effective use of mobile technologies in research activities. However, while there is a moderate availability of mobile technology devices in libraries, their potential is underutilised for academic purposes. Instead, a significant portion of device usage is for personal communication and social networking, with only 24% of students using their smartphones for academic activities. The study concludes that Postgraduate students' attitudes towards mobile technology are pivotal in facilitating research productivity and innovation. Positive engagement with these technologies can improve the accessibility and efficiency of information services, which are crucial for research endeavours. The study recommends the optimisation of mobile-friendly resources, increased funding for updated technology in libraries, and continuous professional development for Postgraduate students to enhance their capability in utilising mobile technologies effectively. Additionally, addressing infrastructural challenges such as network connectivity and power supply is essential to promote equitable access to mobile technology resources in Nigerian universities.

***Keywords**: Information Provision Services, Mobile Technology Devices, Postgraduate students' Attitude,*

1.1. Introduction

Research activities create avenues for innovative and productive ideas and originality in research, following the various processes involved in conducting ideal research. Research activities are defined as human activities based on intellectual application in the investigation of the matter. The primary purpose of postgraduate research is to discover, interpret, and

develop methods and systems for advancing human knowledge on various scientific and social matters of the world and the universe. Research activities can adopt the use of a scientific method in the advancement of knowledge. It is regarded as a systematic effort to gain new knowledge. The dictionary meaning of research is "a careful investigation or enquiry, especially through search for new facts in any branch of knowledge". According to Anyim (2020), research activities are systematic investigations, including research development, testing, and evaluation, designed to develop or contribute to generalisable knowledge. These activities include but are not limited to designing research, directing research, performing experiments, enrolling research subjects, making decisions regarding eligibility to participate in research, participating in observational registry programmes, analysing or reporting research data, or submitting manuscripts concerning research for publication. In the view of Anyim's (2020) definition, it could be further explained that research activities are systematic because they follow order and procedures in achieving the research-set goals and objectives.

Similarly, Manuwa (2019) reported that there are other types of research activities that postgraduate students can engage in to find out new ideas or trends in their profession or field of specialisation, which may include: master's theses or dissertations, attending workshops, seminars, and conferences, both nationally and internationally. The need and importance of research activities, especially among postgraduate students in universities, cannot be overemphasised because they enhance innovation and productivity academically. The study took cognisance of the use of mobile technology devices in facilitating the research activities of postgraduate students, as well as leveraging the attitude of Postgraduate students in the provision of information services. Postgraduate students use mobile technology devices for multifarious research activities ranging from sourcing information resources for writing seminar and conference papers, writing theses and dissertations, downloading articles, searching databases for updated information, as well as interacting with their supervisors.

The use of mobile technology devices effectively could lead to excellent research activities among postgraduate students. Postgraduate students are therefore encouraged to leverage the existence of mobile technology devices for quality research output. The advent of mobile technology devices, such as smartphones and tablets, has changed the landscape of research and information access. These devices offer students, including postgraduate students in the social sciences, unprecedented opportunities to access and manage information with ease. Mobile technology has also provided libraries with new avenues to deliver information services effectively, adapting to the changing needs and preferences of users. However, Postgraduate students play a pivotal role in facilitating access to information and guiding social science postgraduate students in their research endeavours. Their attitude towards embracing and leveraging mobile technology devices can significantly impact the quality of information services provided to postgraduate students. It is essential to understand Postgraduate students' attitudes to mobile technology devices to ensure that they are equipped to meet the evolving needs of their users. Additionally, Postgraduate students in Nigerian universities, like their counterparts worldwide, face several challenges when it comes to integrating mobile technology into their services. These challenges include inadequate infrastructure, limited budgets, and the need for continuous training to stay updated with the latest technologies. Moreover, concerns regarding information security, data privacy, and digital literacy also affect Postgraduate students' approach to mobile technology. Pew Research Centre (2016) defined mobile technologies as devices that are capable of being hand-held, carried or moved easily. They are devices that can be used "on the go". Examples of mobile technologies include smartphones and tablets/iPads. Mobile technologies are enabled with web browsers, email, cameras, Wi-Fi, Bluetooth and audio/video players.

The Postgraduate students' professional development is a key factor in the effective integration of mobile technologies in their operations in the library. Hence, whether beginner or experienced, mobile technology-related training programs can develop Postgraduate students' competencies in mobile technology use, influencing Postgraduate students' attitudes towards mobile technologies and assisting Postgraduate students in recognising how mobile technologies are significant in meeting the information needs of users, especially concerning the provision of information services to social science postgraduate students.

1.2. Statement of the Research Problem

The introduction of mobile technology devices in universities in Nigeria has motivated the research activities of both students and faculty through effective and efficient information service provision. In an ideal situation, mobile technology devices are supposed to facilitate the research activities of postgraduate students. Postgraduate studentss are expected to show a positive attitude towards the provision of information services that will bring about research innovation and productivity using mobile technology devices such as smartphones, iPads, iPods, tablets, etc.. as well as mobile applications such as WhatsApp, Gmail, Messengers, Twitter, Chat Generating Pre-print Transformer (GPT), Dropbox, Udemy, Zotero and Coursera etc (Open Al, 2022). For research purposes, rather than the non-academic use

of this platform, most of the time is spent on personal chatting and social engagement. The actual situation after preliminary investigation by the researcher revealed that the use of mobile technology devices among postgraduate students in their research activities is at its lowest ebb. It was also revealed that issues of network connectivity, as well as erratic power supply, have also slowed down the use of mobile technology devices in facilitating the research activities of Social Science postgraduate students concerning the provision of information services using the mobile technology platform. Empirical evidence from the study carried out by Charles and Kevin (2017) on the use of smartphones among college students in Nigeria, a revelation and reflections. The result of the study showed that 38.2 percent of students spent between 1 and 5 hours per day on their phones. The majority of the respondents, amounting to 555 of them (98%), used their smartphones to communicate with family and friends. About seventy-five percent used their smartphones for social networking. Only twenty-four per cent of students engaged their smartphones for academic activities, including research activities.

This is evident in the write-up by Gaffar, Abdul, and Kumar (2019***),*** who opined that the use of mobile technology devices in facilitating the research activities of postgraduate students in Nigerian universities has been at its lowest ebb, even when mobile technology devices, if properly utilised, could bring about effective research productivity and innovation among postgraduate students. It is imperative to note that academic libraries in this part of the world are still in the embryonic stage in terms of providing information services through mobile technology, hence the need for this study to investigate Postgraduate students' Attitudes to Mobile Technology Devices and the Provision of Information Services for Research Activities of Social Science Postgraduate Students in Nigerian Universities.

1.3 Aim and Objectives of the Study

The study aims to investigate Postgraduate students' Attitudes to mobile Technology devices and the provision of information services for research activities of postgraduate students in universities in Nigeria. To achieve this, the following specific objectives are set:

1. To determine the type of research activities carried out by postgraduate students in universities in North-central Nigeria, using mobile technology devices
2. To ascertain the level of research activities carried out by postgraduate students in universities in North-Central, Nigeria.
3. The availability of mobile technology devices (smartphones, iPods, iPads, GPSs, personal digital assistants, etc.) is used for postgraduate students' research activities in universities in Nigeria.

1.4. Scope and Significance

The general scope of the study is to investigate Postgraduate students' Attitudes to mobile technology devices, and the provision of information services for the research activities of postgraduate students in universities in Nigeria. The geographical scope of the study covers universities in North-central Nigeria. The study is limited to some selected federal, state and private Universities in North-central Nigeria. The content scope of the study includes research activities, mobile technology devices, Postgraduate students' attitude, provision of information services and postgraduate students.

Similarly, the study will be of great benefit to the following: University Libraries, Postgraduate students, Information Managers, Postgraduate students, Researchers, and IT Specialists/Database Administrators. Technologists, Educationists, Telecommunication Industries, Information Service Providers and Policy Makers

3.0. Research Methodology

The research design adopted mixed methods for the study, that is, a correlational type of descriptive design and an observation checklist. The total population of the study was 15,041 from 10 Universities in North-Central, Nigeria. The determined sample size for the study is 1024 postgraduate students using the Krejcie and Morgan (1970) table for determining the sample size of a large population, while the proportionate sampling technique using Bowler's allocation formula (Abedoh, 2018) was used to determine the sampling fraction for each of the universities. The sampling fraction used in selecting a sample of 1024 postgraduate students out of 15,041 is 2.5%. This gave the researcher 1024 postgraduate students selected from ten (10) universities. The sample size of 1024 was considered adequate and represented the total population. This became possible by taking cognisance of the fact that the population is a standardised population of postgraduate students. Corroboratively, scholars of note like Krejcie and Morgan (1970) asserted that using a population as vast as 75,000, a sample of 0.51% could be used. Data were collected through questionnaires administered by the researcher with the assistance of trained research assistants across ten universities in North-Central Nigeria. A total of 1,024 questionnaires were distributed, and 796 valid copies were retrieved within two

weeks, yielding a response rate of 78%. Data analysis was conducted using both descriptive and inferential statistical methods. Descriptive statistics (frequency counts, mean, and standard deviation) were used to answer the research questions, while inferential statistics, Pearson Product–Moment Correlation Coefficient and multiple regression analysis were employed to test the null hypotheses and examine the relationships and predictive effects of the independent variables on postgraduate students' research activities.

4.0. Results and Discussions of Findings

Out of 1,024 copies of the questionnaire distributed, 796 copies were completed, retrieved and found usable, representing 78% success. The response rate from the 10 universities in North Central Nigeria is revealed in

Table 4.1: Response Rate

		Copies distributed	Copies retrieved.
1.	Federal University of Technology, Minna, Niger State.	155	121
2.	University of Abuja, Abuja	111	86
3.	University of Jos, Jos.	168	130

Source*:* Author's Fieldwork (2023)

Table 4.2 revealed the results of 796 respondents from the 10 universities selected for the study. The result showed the perceptions of postgraduate students on various research activities. A benchmark mean of 2.82 was used to classify activities into "Agreed" or "Disagreed." Similarly, Agreed Activities (Mean ≥ 2.82): Workshops (2.84), Seminars (2.86), Basic Research (2.86), Publishing Research Findings (2.84), Applied Research (2.90), Symposiums (2.82), and Interdisciplinary Research (2.82) are well-regarded, reflecting strong engagement and relevance. While Disagreed Activities (Mean < 2.82): Research Publications (2.75), Translational Research (2.74), and Conferences (2.72) scored below the benchmark, suggesting challenges in these areas. With an average weighted mean of 2.82 and moderate variability (SD = 1.12), most activities are positively perceived, while a few, like research publications and conferences, require targeted improvements in universities in North-Central, Nigeria.

4.3 Objective 2: Find out the level of research activities carried out by postgraduate students in universities in Nigeria.

Table 4.3: Level of Research Activities Carried Out by Postgraduate Students in Universities in Nigeria (N=1024)

Key: VHL = Very High Level, HL = High Level, LL Low Level, VLL = Very Low Level, StD = Standard Deviation and (Decision Mean = 2.92).

Source*:* Author's Fieldwork (2023).

Table 4.3 revealed the results of 796 respondents from the 10 universities selected for the study. The data presented in Table 4.3 shows the level of engagement in various research activities among postgraduate students in Nigerian universities. The average weighted mean score of 2.92 suggests that postgraduate students generally exhibit a moderate level of research activity. However, engagement levels vary across different research activities.

Research activities with high-level engagements (mean ≥ 3.00) include seminars (3.08), basic research (2.98), publishing research findings (2.98), applied research (2.98), symposiums (2.90), and interdisciplinary research (3.04). These results indicate that postgraduate students actively participate in these areas, particularly in seminars and interdisciplinary research, which received the highest engagement scores.

Conversely, workshops (2.86), research publications (2.92), translational research (2.80), and conferences (2.61) received low-level ratings, indicating that students engage less in these activities. The lowest level of engagement was observed in conferences (2.61), suggesting possible challenges such as limited access, financial constraints, or a lack of institutional encouragement for participation in academic conferences.

Overall, the findings suggest that while postgraduate students are involved in core research activities such as seminars, basic research, and interdisciplinary research, there is a need for greater support and encouragement in areas like workshops, research publications, and conferences. Strengthening institutional policies, funding opportunities, and mentorship programs could help improve participation in these critical areas and enhance the overall research output of postgraduate students in universities in North-Central, Nigeria.

4.4 Objective 3: Determine the availability of mobile technology devices used for postgraduate students' research activities in universities in Nigeria.

Source*:* Author's Fieldwork (2023).

Table 4.4 shows the checklist for observation on the availability of mobile technology devices. The result showed that the Federal University of Technology Minna and Ibrahim Badamasi Babangida University availability of mobile technologies devices used by Social Science postgraduate students is 5(42%) and 7(58%) for non-availability of mobile technologies respectively. However, the University of Abuja, University of Jos, University of Ilorin, Nile University of Nigeria (NUN), Abuja, Prince Abubakar Audu University, Anyigba. Benue State University, Makurdi, Kwara State University, and Nasarawa State University's availability and non-availability of mobile technologies are 6(50%) and 6(50%), respectively. This implies that there is a greater need for the provision and adoption of mobile technology devices for research activities by postgraduate students in universities in North Central Nigeria.

4.1. Discussion of the findings is as follows:

The types of research activities carried out by social science postgraduate students in universities in Nigeria are dissertation writing, attendance of workshops, seminars, symposiums for research purposes, and publications of research findings in reputable journals. The findings were supported by (Abu-helalah *et al.,* 2015; Beanland *et al.,* 2020; Borakati *et al.,* 2017; Kozlov *et al.,* 2017; Noguez & Neri, 2019; Razeghi, 2019; Roach, 2017; Swan *et al.,* 2018; Weiner & Watkinson, 2014). The authors asserted that research activities such as attending conferences, seminars, and workshops, and interacting with intellectuals in various fields of human endeavour, are key to innovation and academic publishing, especially among social science postgraduate students.

In the same vein, the level of research activities carried out by postgraduate students in universities in Nigeria through attendance of workshops, conferences, seminars, thesis and dissertation writing, and interaction with senior colleagues in the profession is at a very high level. Razeghi (2019) supported this by carrying out a study on factors influencing the Research Activities of Postgraduate Students at the University of Mazandaran, Iran. The findings of Razeghi (2019) showed that there was no significant difference between the scientific activities of doctoral and master students in terms of gender, marital status and locality, as their research activities are at a high level. Beta coefficients indicated that the academic activities of the students were affected most by the university facilities (β=0.36) and students' satisfaction with the teachers (β=0.34), and the least (β=0.17) by students' interaction with professors.

However, there is a moderate number of mobile technology devices available in university libraries in North Central Nigeria. These include mobile phones, iPads, iPods, Global Positioning systems, personal digital assistants, Bluetooth, wireless fidelity, multi-touch screens, mobile websites, media creation and capture tools, and pocket personal computers. This was against Gaffar *et al.'s* (2019) assertion that there has been an explosion of specialised software applications to support communication for those who require the use of mobile technology for their research activities. In the same vein, Mohammadi, Sarvestani, and Nouroozi (2020) affirmed that the wide availability of mobile technology devices such as smartphones, iPads, iPods, and personal digital assistants (PDAs) has made research activities seamless.

4.2. Summary of the Findings

The following findings emanated from the study:

1. Types of research activities carried out by social science postgraduate students in universities in Nigeria are dissertation writing, attendance of workshops, seminars, symposiums for research purposes, and publications of research findings in reputable journals.

2. The level of research activities carried out by postgraduate students in universities in Nigeria through attendance of workshops, conferences, seminars, thesis and dissertation writing, and interaction with senior colleagues in the profession is very high.
3. There is a moderate number of mobile technology devices available in university libraries in North Central Nigeria. These include mobile phones, iPads, iPods, Global Positioning systems, personal digital assistants, Bluetooth, wireless fidelity, multi-touch screens, mobile websites, media creation, capture tools, and pocket personal computers.

Conclusion

In conclusion, the study underscores that Postgraduate students' attitudes towards mobile technology devices play a crucial role in shaping the provision of information services for social science postgraduate students' research activities. The findings indicate that embracing mobile technology positively impacts the accessibility, convenience, and efficiency of information retrieval and research activities. The study underscores the need for training and professional development to enhance Postgraduate students' familiarity with mobile technology tools and their effective incorporation into the academic environment. In the broader context of Nigerian universities and the evolving landscape of information services, the study advocates for proactive measures to address the digital divide and promote equitable access to mobile technology resources. It also emphasises the importance of continuous assessment and adaptation of the provision of information services to meet the evolving needs of postgraduate students, who are increasingly reliant on mobile technology devices for their research endeavours.

Recommendations

1. There should be mobile-friendly resources and research tools that are optimised for devices that can facilitate seamless access to information on the go, since postgraduate students' research activities in universities in Nigeria include dissertation writing, attendance of workshops, seminars, symposiums for research purposes, and publications of research findings in a reputable journal.
2. It is important to commend the level of research activities carried out by postgraduate students in universities in Nigeria, as the students actively engage in research activities through attendance of workshops, conferences, seminars, thesis and dissertation writing, and interaction with senior colleagues in the profession.
3. There is a need to allocate sufficient resources to ensure the availability of up-to-date mobile technology devices, software, and applications in libraries, as adequate funding can enable Postgraduate students to offer the latest technology tools to students for their research activities.

Abstract

This study focused on research productivity of Science Education master's degree researchers by examining the citations and references in 30 copies of master's degree theses in science education and the availability of the sources within the library at Federal University of Technology, Minna, Nigeria, between 2015 and 2019. The theses were examined according to

specific characteristics, including their subject focus, citation and reference counts, authorship patterns, the prominence of cited publications and journals, and their accessibility within the university library. The study employed descriptive survey design; while tables and charts were used in data presentation. The result revealed that instructional strategies and achievement is the most researched subject area, "Learning outcome" as a subject area, produced the highest frequency of citations and references. Journals were the most cited publications, and; 'Journal of education & practice is the most cited journal. "Three authors" happens to be the most cited authorship pattern while most of the cited journals were not available in the university library. For libraries to achieve their aims and objectives as the gateway for information sources to its users, it is recommended that the library under study adopts the findings of this study to solve this identified problem. These findings can shape library collection development policies generally and serve as a guide for upcoming researchers and directions for future research in science education.

Keywords: *Bibliometrics, Citation analysis, Collection development, Master's degree theses, Science education*

Introduction

Bibliometrics is a collection of methods used to quantify, qualify and evaluate academic, scientific and technological literature to determine patterns or trends. Bibliometrics was first coined and used by Alan Pritchard in an article named 'Statistical bibliography' in 1969. The author defined the term as the application of mathematical and statistical methods to books and other forms of media communication in order to determine their impacts and productivity. According to Asha and Venkatesha (2019), bibliometrics are set of methods employed to study or measure academic literature and scholarly communication. They use mathematical and statistical methods to assess the output of scientific publications.

Bibliometrics studies are divided into several methods such as citation analysis, content analysis and most recently citation content analysis. Citation analysis is a method of studying the bibliographic references used while carrying out a research (Iloka & Abifarin, 2021). Citations are integral parts of research works which clearly show the lists of references mentioned in a publication. According to Anaehobi and Moukebe (2014) citation analysis is a major area of bibliometric research which uses various sets of methods to establish relationship between authors and their articles, as well as assessing the quality and pattern of scholarly communication. Previous studies have used citation analysis to look at the information needs and utilization behaviour of undergraduate and postgraduate scholars. This could reveal much about scholarly communication and could guide collection development in academic libraries.

University award master's degrees to deserving scholars upon completion of their course work and research work in fulfillment of the requirements for the award. The research components of the requirement particularly at the postgraduate levels take predominant space. Thus, the degree of Master is awarded with thesis in partial fulfillment at Federal University of Technology, Minna. Theses present original research results and the process of production is strictly guided by provisions of the awarding institution under the guidance of research supervisors. Theses cover extensive bibliographies which were cited in support of thoughts, concepts, techniques, data analysis and discussion expressed in the research work such that authorities are acknowledged through citations. Theses find their way into

academic publications in form of periodicals, books and monographs, in which bibliometric studies can be based (Borthakur, 2015).

Science Education is a field of study and research which came as the need to educate students in educational technology fields, leading to the award of master's degree. The department is structured to prepare innovative and professional teachers who can demonstrate competence and resourcefulness in instructional design, development, implementation and evaluation of instructional media required in a global society to transform schools into digital age learning environments and to meet the diverse ever-changing needs of students, researchers, society and corporations. These academic departments have produced quite a number of master's degree graduates who have completed their studies and produced theses. These theses are subject of this study; therefore, these studies can be possible in order to identify research trends, growth of knowledge, use, forecast past, present and future trends and information needs.

Statement of the research problem

The evaluation of theses are very pertinent because, it could help libraries, researchers, institutions, and organizations to determine the growth and trends of knowledge, develop norms of standardization, identify libraries patrons' subject interests, preferred formats of information materials, as well as weeding policies in the face of harsh or limited budgetary provision, eliminate the attitude of just-in-case acquisition of library resources and enthrone patron-driven acquisition in libraries. Preliminary studies reveal the absence of this bibliometric study towards the remedial of these identified bottlenecks. In this regard, this study tends to analyze Science Sducation theses and help proffer solutions at Federal University of Technology, Minna.

Objectives of the study

The aim of the study is to analyze cited references appended in master's degree theses in Science Education at Federal University of Technology, Minna. The study's specific objectives are to:

1. find out the subject focus of master's degree theses in Science Education at Federal University of Technology, Minna
2. determine the number of citation and references in master's degree theses at Federal University of Technology, Minna
3. find out the prominence of cited publications in master's degree theses at Federal University of Technology, Minna
4. determine the prominence of journal publication in masters degree theses at the Federal University of Technology, Minna
5. find out the authorship patterns in cited references in master's degree theses at Federal University of Technology, Minna
6. determine the state of availability of highly cited journal publications in master's degree theses at the Federal University of Technology Library, Minna.

Research Questions

The following research questions were asked and answered

1) What are the subject focus areas of master's degree theses in Science Education at Federal University of Technology, Minna?
2) What is the number of citation and references contained in master's degree theses in Science Education at Federal University of Technology, Minna?
3) Which publications are most prominently cited in master's degree theses in Science Education at Federal University of Technology, Minna?
4) What is the prominence of journal publications among the cited references in master's degree theses in Science Education at Federal University of Technology, Minna?
5) What are the authorship patterns of cited references in master's degree theses in Science Education at Federal University of Technology, Minna?
6) What is the state of availability of highly cited journal publications referenced in master's degree theses in the library of Federal University of Technology, Library, Minna?

Literature review

Scholars and researchers involved in research refer to earlier studies similar to the study being undertaken or that is ongoing (Iqbal et al., 2020; Rüdiger et al., 2021). These references and sources consulted indicate earlier research whose methods, opinions, equipment and concepts inspired the citing author to develop a study (Tahamtan & Bornmann, 2020; Rüdiger et al., 2021). Citations are used to evaluate the quality, impact, penetration and originality of individual scholars and corporate entity performance across fields (Worrall & Cohn, 2023; Abramo et al., 2024; Srisawad et al., 2026). The fact that an article is referenced shows that within the author's frame of mind, there exists a similarity between a part and the whole of the referenced article (Khatoon et al., 2024; Mammola et al., 2022).

The conventional view of citation is that it serves as a form of scholarly acknowledgement. It pays homage to pioneering scientific breakthroughs and recognises the contributions of authors whose ideas, findings, or works have been consulted or used in a study. Citation should place emphasis on the real account of the original author's message (Small, 2004).

Citation analysis refers to the study of reference and bibliographic patterns cited in an academic and scientific literature. Citation analysis can be defined as the application of statistical methods to examine the acknowledgement found in a publication such as books, journal articles and monographs and unpublished sources such as theses, dissertations in order to ascertain a method. All these are found within the context of any scholarly literature. When an author consults information from another author's work, he/she will cite the work. The rationale behind this norm is that the norm of science requires them to cite the work that they found useful while pursuing their own study and it is important that they abide by these norms. The notion that references cited by an author are indicators of impact on the author's work is a valid assumption, though variations on this assumption occur many times throughout the article and these assumptions whether implicit or explicit is basic to most types of citation analysis. In addition, another reason for citing is to comply and adhere to applicable norms or laws against plagiarism by acknowledging the originators of ideas, arguments, theories and terms applied towards citations. The analysis of top cited papers in the field of science education was carried out to understand the main characteristics and features of publication such as bibliographic details, authorship collaboration, citation counts and specialty.

Gayan (2018) carried out a study on citation analysis of doctoral theses of Mathematics Education at Tripura University India. The study considered only those theses that were submitted to Shodhganga. According to the author, 6 theses contributing 377 citations were selected for the study. The references were analysed with respect to authorship pattern, year, country, publisher and the kind of documents used. Bradford's law was used to determine the core journals in the field of Mathematics which showed the *Fuzzy sets and Systems* as the journal with have high impact in the field of Mathematics. Furthermore, the half-life of mathematical journals was found to be 22 years from the obsolescence rate of journals in Mathematics. The author also tested the degree of collaboration in the discipline in India and coefficient in the degree of collaboration was established. Average citation per thesis in Mathematics was 62/83 as revealed by the study.

In India, Devi and Das (2016) conducted a study on citation analysis of doctoral dissertations submitted to the Department of English Education at Guwahati University, India between 2009 and 2012. The study analyzed 908 citations appended to six doctoral dissertations. Bibliographic indices such as the number of citations received, different format sources, authorship pattern, collaboration coefficient, obsolescence, age and other parameters were used in analysis of the data gathered. The study showed that books were the most preferred sources of information used by the researchers in the English language literature, and contributed 77% of the total counts, while the second highest source of information were periodicals with 15%. The researchers showed much tendency towards citing older literature that was over a decade or more in their works. The study revealed also that single-author publications contributed 85.1% of the total references, while the collaborative coefficient was summed up to 0.10. The research findings can assist library managers to identify important information sources and can help predict the future of disciplines by academic faculties.

Geetha, Pushpa, Mounesh and Nanditha (2016) studied Computer Science theses submitted to top five Universities in Shodhaganga, contributing electronic theses to the repository between 2014 and 2015. Using citation analysis 4,490 citations were extracted and analysed to ascertain the authorship patterns along with collaboration coefficient calculation, literature formats, journal ranks, book ranks, time span (age) and geographical locations. The study revealed that journals were the most preferred and frequently used information sources by researchers in the computer science field. The investigation showed that the *Journal of the Institute of Electrical and Electronic Engineering (IEEE)* ranked first as the most preferred journal, while other journals and other formats of information sources queued behind it. The study will be helpful in recognizing researcher's needs according to the authors and by recommendation will serve as a feedback towards patron driven acquisition.

Similarly, Labonte (2015) used citation analysis to find out if the Science-Engineering Library at the University of California Santa Barbara was meeting the needs of an interdisciplinary group of 60 faculty members at the new California Nano Systems Institute. The aim of the study was to develop a list of core journals and identified journals that should be added to the sciences engineering library at UCSB. Findings showed that the library subscribed to 98% of the journal in which faculty members published and majorly cited The research provided useful information on citation patterns that can be used for future collections management decision.

Back home in Nigeria, citation analysis was carried out by Aliyu (2015) on doctoral theses in education, University of Maiduguri between 1987 and 2007. Bibliographic details, including subject area of the theses were extracted. Bibliometric techniques were used in the data analysis using frequency counts, and percentage scores. Tables were used also for the presentations of research findings. The study revealed that Curriculum and Instruction ranked as the most researched subject area, while educational psychology was the least researched subject area. The findings also showed that Books and Monographs were the most cited information sources among educational researchers. The author stated that out of 912 journals cited, 18 were identified as the most frequently cited while most of the articles cited by the researchers fall between 1980 and 1989. The study would be of tremendous assistance to potential researchers who wish to exploit other subject areas of education and eliminate just-in-case acquisition in academic libraries.

Similarly, Anaehobi and Muokebe (2014) examined the citation analysis of theses submitted to the Department of Engineering and Technology, Nnamdi Azikiwe University Awka, Nigeria. The study aimed to know the availability of the resources cited. Document analysis guide was employed to gather data from the master's degree theses available in

the Department of Engineering and Technology. 87 theses were studied, and 2,947 citations found therein. Analyses of data were performed with the use of frequency tables and percentages. The findings revealed that internet sources had the least citations with (12.1%). Books were the main information resources used by researchers while journal articles came second with 54.1% and 34.1% respectively. Most of the cited sources were not available in the University Library according to the researcher and the most cited resources in the theses analyzed were foreign materials. The study recommended that the library management should collaborate with the Departments to acquire most used information sources and effort made to acquire those titles used by the researchers hitherto not available in the library.

In their study, Abifarin et. al. (2018) also found out that most of the cited sources in undergraduate students' projects in the Department of Library and Information Technology, Federal University of Technology Minna, were not available in the University Library. From the review of previous work, it was observed that studies were carried out on analysis of citation within a given literature in any field of study over a period. Thus, efforts were geared towards shedding light on the processes of written communication and discovering their historical development and antecedents. Another important reason behind citation analysis is to indicate the quantity and quality of publication output, also to measure the impact and contribution of scholars in each field of study. Additionally, the rationale for most previous work was aimed at helping libraries toward effective management of their collections by providing the preferred and the right sources of information and at the right time for their patrons, even in the era of limited budget and scarce resources.

Research Methodology

Descriptive research design enables a researcher to conduct a productivity count and analyze cited references. The descriptive bibliometrics approach was used to determine and quantify the bibliographic features of cited references in master's theses in Science Education while the evaluative bibliometric approach was used to determine their state of availability in Federal University of Technology Library, Minna. A total of 30 copies of Master's degree theses submitted at the department from 2016 to 2019 were used for the study. Data collection was achieved through the use of Master's Degree Theses Citation Productivity Worksheet (MDTCPW) and Master's degree Theses Availability of Cited References Worksheet (MDTACRW). The data extracted were statistically analyzed and the result presented using tables, frequency and chart.

Results and Discussion

Research Question 1: Distribution of Master's theses in Science Education according to subject focus in Federal university of technology library Minna

Table 1: Distribution of Master's theses according to subject focus in Federal University of Technology Library, Minna.

MTech Sc.Ed.028	228	178

MTech Sc.Ed.029	278	203
MTech Sc.Ed.030	236	182
Total	5202	3710

Table 2. shows citations and reference frequencies of science education theses in Federal University of Technology Minna library. M.TechSc.edu 006 which is learning outcome had the highest number of citations and references, while MTech Sc.edu 009 which is Assessment and Evaluation had the least number of citations studied.

Research Question 3: Highly cited publications in master's degree theses in science education theses in federal university of technology Minna

Table 3 Shows highly cited publications in masters' degree theses in science education theses in Federal University of Technology, Minna.

Publications	Number of Occurrence
Journal	2131
Books	890
Conference proceedings	420
Reports	35
Hand books/Guides	101
BlogSpot	102
Others	31
Total	3710

It is observed in Table 3 that out of 3710 publications cited in science educations masters' theses, 2131 were Journals publications, 890 were books, 420 were for conference proceedings, handbooks/guide and blog spots share a close figure of 101 and 102, while other corporate and other sources of information were 31.

Research Question 4: Highly cited Journals publications in science educations theses of Federal University of Technology, Minna

Table 4: Shows the highly cited Journals publications in science educations theses federal university of technology Minna

Journals	Number of Occurrence
Journal of education and practice	288
Journal of science, technology, mathematics and education	229
IOSR Journal of research & method in education	143
Eurasia journal of mathematics, science and technology education	131
Computers and Education	127
International Journal of instruction	120
American Journal educational research	115
African Journal educational research	98
Higher education	82
American-Eurasia journal of science research	75
Research in science education	68
World journal of education	63
Educational research & reviews	61
Journal of science education	59
International journal of education & evaluation	56
European journal of education	53
International journal of education & ICTs	50
Behavioral sciences	45
International journal of education, learning& development	45
Journal of classroom interaction	42

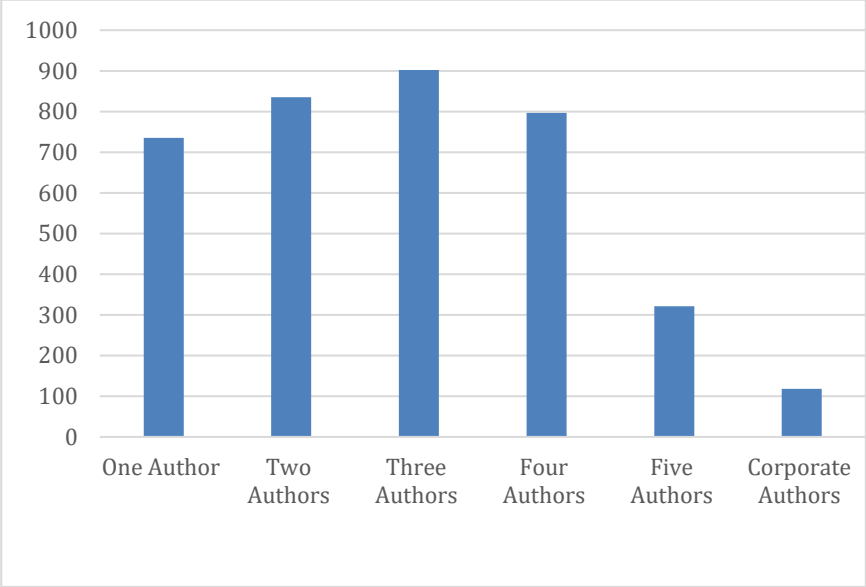
International journal of instruction	38
Others	143
Total	2131

Table 4 shows that out of 2131 journal articles cited in science education theses, Journal of Education & Practice have the highest frequency of occurrence with 288, followed by journal of science, technology, mathematics & education with 229 while journal of research & methods in education had 143. Eurasia Journal of mathematics, science & technology educations with 131, going down the table, International Journal of Instruction had the least of 38 entries while the rest of cited journals below the benchmark of 38 were classified as other with 143 many studies reported that journal article were most cited publications used on research writing.

Research Question 5: Authorship patterns in science education theses in Federal University of Technology, Minna.

Table 5: presents the types of authorship cited in science education theses in Federal University of Technology, Minna.

Authorship Patterns in Science Education Masters degree theses.



One authors	737
Two authors	835
three authors	902
four authors	797
five authors	321
Corporative organization	118
Total	3710

Table 5 reveals that out of 3710 references one author had 737 entries, two authors had 835 entries, three authors with 902 entries and it is highest entry. Four authors had 797, five authors had 321 while the corporate authors with 118 entries.

On the availability of highly cited journal publication in science education, Table 6 reveals the only two journals viz: Journal of Education and Practice, Journals of Science, Technology, Mathematics & Education, and Educational Research & Reviews were available in the library. The library is expected to stock the holding with relevant and most used information resources (journals inclusive) that would properly cater for the science education researchers, since journal article contains scientific features and recent discoveries on knowledge.

Discussion of Findings

Since educational researchers are exploring diverse methods and technological ways of enhancing learning outcomes, academic performance and achievement of students, the findings of this study presented development of instructional strategies as the most areas of specialization of researchers at this period under study. Contrastingly, ICTs competence and its learning outcome is one the least research area among Science education researchers. Priority should be given to this area in order to meet the global educational practice of infusing ICTs resources as it is obtainable in developed countries. Though, the distribution of subject focus under science education were satisfactorily covered, more researches are needed in some areas such as ICTs Competence and Learning outcome as well as Career development. This finding is similar to that of Aliyu (2015) who reported that Curriculum and Instruction were the most researched subject area while Educational psychology was the least researched subject focus among Doctoral researchers on education, University of Maiduguri, Nigeria.

It is essential for researchers to appropriately acknowledge and cite a substantial range of authorities and sources consulted during the course of their investigations, as references and acknowledgements constitute a key component of a well-structured research report, including theses. Citations remain a fundamental element of scholarly writing, as they clearly demonstrate the extent to which a study is grounded in, and connected to, prior publications and established knowledge. Thelwall (2010) argues that no research work exists in isolation; rather, it is necessarily embedded within the existing body of literature in its field. In this sense, citations serve not only as pointers to earlier studies but also as bibliographic indicators that provide detailed insight into the cited works, including authorship, titles, and intellectual contributions. Consequently, citations help to characterize and document the nature and features of the sources consulted in the process of conducting research work.

Based on the data collected above on prominence of cited publications journals were the most prominent publications cited, followed by books and others. This finding is in line with the findings of Kanpur (2023) and Iloka and Abifarin (2021) who stated that researchers make reference to more journal articles than other information sources while carrying out research. This is attributed to the fact that Journals contain latest information and published sequentially. Analyzing cited references would assist collection development experts to select preferred information resources for researchers in science education.

Based on the findings of this study, *Journal of Education and Practice* is the most cited journal publication, having the highest citation counts. Libraries and collection development experts should employ the findings of this study to acquire and develop their collections as it pertains to journals and periodicals. It is general and acceptable belief that journals are the best medium of communicating scientific breakthroughs in researches; hence libraries are expected to do well and bring in the highly used sources that fit in the user's information and research needs.

It is important that researchers appropriately acknowledge and cite relevant sources in their scholarly work. Regarding authorship patterns in cited references within science education, the study revealed that works produced by three authors occurred most frequently. This reflects an emerging trend in which collaborative research involving two or more authors is increasingly used to critically examine research problems and generate well-substantiated conclusions. In this context, such studies are often viewed as outcomes of collective scholarly effort, where research issues are jointly identified, analysed, and addressed through collaboration among multiple authors (Eclevia & Janio, 2016).

On the availability of highly cited journal publication in science education, Table 6 reveals that *Journal of Education and Practice, Journal of Science, Technology, Mathematics & Education, and Educational Research and Reviews* were available in the library. The library is expected to stock the holding with relevant and most used information resources

particularly journals that would properly cater for the science education researchers' information needs, since journal articles contain scientific feats and recent discoveries in knowledge.

Conclusion

Examining cited reference in theses are important and provides a leeway towards finding new trends in meeting the information needs of researchers in science education. The study analyzed master's degree theses in Science Education which explored bibliometric features of cited references within the body of the theses. These results yielded valuable insights on how science education researchers cite sources which can be used for library collection development.

Challenges and Opportunities of Implementing Digital Library Services in Academic Libraries in Niger State

ADAMU, Mahmud CLN1 adamumahmud109@gmail.com +2348032342243
Rabi Shehu Ahmed CLN2 rabishehuahmed@gmail.com +2348108150125
Abubakar Gimba Library, IBB University, Lapai, Niger State

Abstract

This study examined the challenges and opportunities of implementing digital library services in academic libraries in Niger State, Nigeria. Using a descriptive survey design, the research investigated 148 library staff from four universities in Niger State. A validated questionnaire with reliability coefficient of 0.84 was used for data collection, achieving a response rate of 91.7% (154 respondents). Findings revealed that 73.4% of respondents were aware of digital library services, with e-journals (81.2%) and institutional repositories (76.6%) being most implemented. Major challenges included inadequate funding (Mean = 3.42), poor internet connectivity (Mean = 3.38), insufficient ICT infrastructure (Mean = 3.35), and lack of technical expertise (Mean = 3.29). Significant opportunities identified were enhanced access to global information resources (Mean = 3.51), improved user satisfaction (Mean = 3.46), and increased research productivity (Mean = 3.44). Chi-square analysis revealed significant associations between institutional type and level of digital library implementation ($\chi^2 = 18.47$, $p < 0.05$). The study recommends increased budgetary allocation for digital infrastructure, comprehensive staff training programs, development of institutional digital library policies, and establishment of consortia for resource sharing to maximize opportunities while addressing implementation challenges.

Keywords: *Digital Library Services, Challenges and Opportunities, Implementing, Academic Libraries, Niger State, Nigeria*

Introduction

The digital transformation of academic libraries represents a fundamental shift in how information is organized, preserved, accessed, and disseminated in contemporary higher education institutions (Breeding, 2016). Digital library services encompass a wide array of technologically-enabled offerings including electronic resource management, institutional repositories, digital archives, online public access catalogs, remote access services, and virtual reference platforms that collectively enhance the capacity of academic libraries to fulfill their mission of supporting teaching, learning, and research (Chowdhury & Chowdhury, 2003). In developing countries, particularly in Sub-Saharan Africa, the implementation of digital library services presents both unprecedented opportunities for bridging the digital divide and formidable challenges related to infrastructure deficits, limited financial resources, inadequate technical expertise, and inconsistent policy frameworks (Dhanavandan & Tamizhchelvan, 2015). Nigerian academic libraries have progressively embraced digitalization initiatives over the past two decades, with varying degrees of success influenced by institutional priorities, available resources, leadership commitment, and external support from development partners and government agencies (Ani et al., 2016).

Niger State, located in the North Central geopolitical zone of Nigeria, hosts several universities with academic libraries at different stages of digital service implementation, ranging from basic automation to more sophisticated digital repository systems and electronic resource management platforms (Okpe et al., 2018). Understanding the specific challenges encountered and opportunities available in this geographical context is essential for developing evidence-based strategies that can accelerate digital library adoption while ensuring sustainability and maximizing impact on the academic community (Akpojotor, 2016). This empirical study systematically examines the current state of digital library service implementation in Niger State academic libraries, identifies key obstacles hindering progress, explores opportunities for advancement, and provides actionable recommendations for stakeholders including university administrators, library management, government agencies, and development partners committed to strengthening the digital information infrastructure in Nigerian higher education.

Literature Review

Conceptual Framework of Digital Library Services

Digital libraries represent organized collections of digital information resources combined with sophisticated technological infrastructure, metadata standards, user interfaces, and service models designed to facilitate discovery, access, use, and preservation of scholarly content (Arms, 2000). Okerson (2000) conceptualizes digital library services as encompassing three interconnected dimensions: content (digitized and born-digital

materials), technology (hardware, software, networks), and services (reference, instruction, access facilitation), all working synergistically to support the information needs of academic communities. In the African context, Mutula (2012) argues that digital libraries must be understood not merely as technological implementations but as socio-technical systems that require careful consideration of local contexts, user capabilities, organizational cultures, and sustainability mechanisms. Contemporary digital library services in academic institutions typically include electronic journals and databases, institutional repositories for research outputs, digital archives of unique collections, integrated library management systems, discovery tools, digital reference services, and mobile applications that extend library services beyond physical boundaries (Borgman, 2000). Thanuskodi (2012) emphasizes that successful digital library implementation requires alignment between technological capabilities and user needs, suggesting that services should be designed based on systematic assessment of user requirements, information-seeking behaviors, and institutional priorities rather than solely on technological possibilities.

Global Trends in Digital Library Implementation

The evolution of digital library services globally has been characterized by progressive sophistication, moving from simple digitization projects in the 1990s to comprehensive digital ecosystems integrating discovery, access, analytics, and preservation functions (Breeding, 2016). In developed countries, academic libraries have achieved substantial progress in digital service delivery, with institutions like the Massachusetts Institute of Technology, Oxford University, and Stanford University operating comprehensive digital library platforms that provide seamless access to millions of digital resources, sophisticated search capabilities, personalized user interfaces, and integration with research and learning management systems (Oguz & Andem, 2020). European universities have led in developing open access repositories and collaborative digital library networks, exemplified by initiatives such as Europeana and the Digital Library Federation, which demonstrate the power of consortia approaches to digital library development (Tedd, 2005). Asian countries, particularly China, India, Singapore, and Malaysia, have made remarkable investments in digital library infrastructure as part of broader national digitalization strategies, with government support, substantial funding allocations, and comprehensive training programs facilitating rapid adoption and scaling of digital services (Ramzan & Singh, 2010). In contrast, academic libraries in developing countries, particularly in Africa, face significant disparities in digital library development, with most institutions still grappling with foundational challenges of inadequate infrastructure, limited bandwidth, unstable electricity supply, insufficient funding, and shortage of technical personnel (Nwezeh, 2010).

Digital Library Implementation in Nigerian Academic Libraries

Nigerian academic libraries began serious engagement with digital library initiatives in the early 2000s, spurred by global trends toward electronic resource adoption, institutional pressures for modernization, and advocacy from professional associations such as the Nigerian Library Association (Echezona & Ugwuanyi, 2010). Adeniran (2013) documents that federal universities in Nigeria have generally progressed further in digital library implementation compared to state and private universities, attributed to relatively better funding, access to international donor support, and participation in consortia such as the Nigerian University Libraries Consortium (NULIB) which facilitates group subscriptions to electronic databases. Research by Ani and Ahiauzu (2008) revealed that while 78% of Nigerian university libraries had initiated some form of digital library services, implementation remained largely fragmented, with most institutions operating hybrid systems combining traditional print-based services with limited digital offerings rather than comprehensive digital library platforms. Challenges documented in Nigerian contexts include erratic power supply that disrupts digital services, limited internet bandwidth affecting access speeds and reliability, inadequate budgetary provisions for electronic resources and infrastructure maintenance, shortage of library staff with requisite ICT competencies, and absence of supportive institutional policies mandating digital content deposit and access (Ilo & Ifijeh, 2020). Despite these challenges, Nigerian academic libraries have recorded notable achievements including establishment of institutional repositories at major universities such as University of Nigeria Nsukka, Covenant University, and University of Ibadan, subscription to major electronic databases through NULIB, implementation of integrated library management systems such as Koha and Virtua, and development of digital archives preserving unique Nigerian content (Emezie & Nwaohiri, 2013).

Theoretical Frameworks for Understanding Digital Library Adoption

The Technology Acceptance Model (TAM), developed by Davis (1989), provides a theoretical lens for understanding factors influencing adoption of digital library services, positing that perceived usefulness and perceived ease of use are primary determinants of technology acceptance among users and implementers.

Okello-Obura and Kigongo-Bukenya (2011) applied TAM in East African academic libraries and found that librarians' intentions to adopt digital library systems were significantly influenced by their perceptions of how these technologies would enhance job performance and the extent to which they appeared easy to learn and operate. The Diffusion of Innovation Theory by Rogers (2003) offers another valuable framework, suggesting that adoption of digital library services follows predictable patterns influenced by innovation characteristics (relative advantage, compatibility, complexity, trial and error, observable characteristics, communication channels, time, and social system attributes. Mavodza and Ngulube (2011) utilized diffusion theory to explain varying rates of digital library adoption across Southern African universities, finding that institutions with strong leadership support, clear communication about benefits, and opportunities for staff to experiment with technologies achieved faster and more sustainable implementation. The Unified Theory of Acceptance and Use of Technology (UTAUT), proposed by Venkatesh et al. (2003), integrates elements from multiple models and identifies performance expectancy, effort expectancy, social influence, and facilitating conditions as key predictors of technology adoption, moderated by factors such as age, gender, experience, and voluntariness of use. Quadri (2012) applied UTAUT to examine digital library acceptance among Nigerian university librarians and discovered that facilitating conditions (infrastructure, technical support) and performance expectancy (anticipated benefits) were more influential than social factors in predicting adoption intentions, suggesting that practical support and demonstrated value are critical for successful implementation in resource-constrained environments.

Challenges of Digital Library Implementation in Developing Countries

Academic libraries in developing countries encounter multifaceted challenges that impede effective digital library implementation, beginning with fundamental infrastructure deficits including unreliable electricity supply, limited internet connectivity, inadequate computing hardware, and insufficient server capacity to host and deliver digital content (Mutula, 2012). Funding constraints represent perhaps the most pervasive challenge, as digital library development requires substantial initial capital investments for hardware, software, digitization equipment, and electronic resource subscriptions, coupled with ongoing operational costs for bandwidth, system maintenance, staff training, and content licensing that strain the limited budgets of academic institutions in developing economies (Nwezeh, 2010). Human resource challenges manifest in multiple dimensions: insufficient numbers of library staff overall, shortage of personnel with specialized ICT skills required for digital library management, limited opportunities for professional development and training, and brain drain as skilled professionals migrate to better-paying opportunities in the private sector or abroad (Ani et al., 2016).

Technological challenges include rapid obsolescence of hardware and software requiring frequent upgrades, compatibility issues between different systems and standards, inadequate technical support from vendors operating primarily in developed countries, and security vulnerabilities that expose digital library systems to cyber threats and data loss (Akpojotor, 2016). Organizational and cultural barriers include resistance to change among library staff accustomed to traditional practices, inadequate management support for digital initiatives, absence of institutional policies governing digital content creation and access, weak collaboration between libraries and IT departments, and insufficient user awareness and training to effectively utilize available digital services (Okpe et al., 2018).

Opportunities Presented by Digital Library Services

Despite significant challenges, digital library services offer transformative opportunities for academic libraries in developing countries to overcome traditional limitations and enhance their service delivery (Thanuskodi, 2012). Enhanced access to information represents the primary opportunity, as digital libraries eliminate geographical and temporal barriers to information access, enabling users to retrieve scholarly resources 24/7 from any location with internet connectivity, thereby supporting distance education programs and addressing the perennial problem of limited physical collections in African university libraries (Tella et al., 2009). Improved resource sharing and collaboration become possible through digital platforms, as libraries can participate in consortia, share digital collections, engage in cooperative cataloging, and provide users with access to vastly larger collections than any single institution could afford independently (Okiy, 2010). Digital preservation capabilities offer opportunities to safeguard unique African content including theses, dissertations, grey literature, indigenous knowledge, and cultural heritage materials that are often at risk of deterioration or loss in physical formats, while simultaneously increasing their visibility and accessibility to global researchers (Ukachi, 2013).

Enhanced service delivery opportunities include provision of personalized services based on user profiles and usage analytics, integration with learning management systems to embed library resources directly into courses, development of mobile applications extending library services to smartphone users, and implementation of virtual reference services providing expert assistance remotely (Iroaganachi et al., 2015). Research productivity and visibility gains constitute another significant opportunity, as institutional repositories enable academic libraries to collect, preserve, and showcase their institutions' research outputs, increasing citation rates and institutional rankings while supporting open access mandates from funding agencies (Bamigbola, 2014). Operational efficiency improvements include streamlined workflows through automation, reduced space requirements for physical collections allowing reallocation to user-centered spaces, better inventory management through RFID technology, and data-driven decision making enabled by usage statistics and analytics tools embedded in digital library platforms (Owolabi et al., 2016).

Digital Library Development in Niger State Context

Niger State academic libraries operate within a unique context characterized by relative infrastructural development compared to some northern Nigerian states but still facing substantial challenges typical of the broader Nigerian academic library system (Okpe et al., 2018). Federal University of Technology, Minna, as the oldest university in the state established in 1983, has led in digital library initiatives with early adoption of library automation systems, subscription to electronic databases through NULIB, and establishment of an institutional repository, though sustainability challenges have periodically disrupted services (Bello & Amusa, 2020). Ibrahim Badamasi Babangida University, Lapai, established in 2005, has made progressive efforts toward digital service provision including automation of library operations and development of digital collections, though limited by funding constraints and technical staff shortages (Abdullahi & Mohammed, 2016). State-owned institutions such as Federal University of Education, Kontagora, face additional challenges related to inconsistent government funding and lower resource allocations compared to federal institutions, resulting in slower progress in digital library implementation and greater reliance on open-source solutions (Adekunmisi et al., 2015).

The overall digital library landscape in Niger State reflects a transitional stage where basic automation and limited digital services exist alongside traditional operations, with significant variation across institutions in terms of available resources, staff competencies, management commitment, and strategic planning for digital transformation (Akpojotor, 2016). Understanding the specific challenges and opportunities within this context requires empirical investigation that captures the experiences, perceptions, and recommendations of library professionals working directly with digital library implementation efforts in these institutions, which this study seeks to provide through systematic data collection and analysis.

Statement of the Problem

Academic libraries in Niger State universities are at critical junctures in their digital transformation journeys, facing pressures to modernize services and provide digital access to information resources while simultaneously confronting substantial infrastructural, financial, technical, and organizational challenges that complicate implementation efforts (Okpe et al., 2018). While anecdotal evidence and isolated reports suggest that these libraries have initiated various digital library services including automation systems, electronic resource subscriptions, and institutional repositories, comprehensive empirical data on the extent of implementation, specific challenges encountered, available opportunities, and factors influencing success or failure remain limited (Akpojotor, 2016). This knowledge gap creates difficulties for library administrators seeking to develop evidence-based strategic plans, university management making resource allocation decisions, professional associations designing training interventions, and policymakers formulating supportive frameworks for digital library development in the region (Ani et al., 2016). Furthermore, without systematic documentation of current implementation status, identification of critical success factors, and understanding of contextual opportunities that could be leveraged, efforts to advance digital library services may be inefficient, misdirected, or unsustainable, potentially resulting in wasted investments and missed opportunities to enhance library services and support institutional academic missions (Nwezeh, 2010).

The absence of empirical evidence specifically focused on Niger State academic libraries means that these institutions may be implementing digital services without adequate understanding of what works in their specific context, which challenges are most critical to address, what opportunities are most feasible to pursue, and how their experiences compare with broader national and international trends (Okello-Obura & Kigongo-Bukenya, 2011). This study addresses this critical gap by providing comprehensive empirical data on the challenges and opportunities of implementing digital library services in academic libraries in Niger State,

thereby contributing evidence that can inform policy development, resource allocation, strategic planning, professional development initiatives, and collaborative efforts aimed at strengthening digital library infrastructure and services to better serve the academic communities in the region.

Objectives of the Study

The study was guided by the following specific objectives:

1. To assess the current level of digital library service implementation in academic libraries in Niger State universities.
2. To identify the challenges hindering effective implementation of digital library services in academic libraries in Niger State universities.
3. To examine the opportunities available for advancing digital library services in academic libraries in Niger State universities.

Methodology

Research Design

This study adopted a descriptive survey research design to examine the challenges and opportunities of implementing digital library services in academic libraries in Niger State universities. The descriptive survey design was deemed appropriate because it enabled the researcher to systematically collect quantitative data on current implementation status, challenges faced, opportunities available, and perceptions of library staff regarding digital library services from a representative sample of the study population (Creswell & Creswell, 2018). This research design has been extensively utilized in library and information science research for investigating professional practices, service delivery patterns, and technology adoption in academic library settings (Pickard, 2013).

Population and Sample

The target population for this study comprised all library staff (professional librarians, paraprofessionals, and library assistants) working in the four main universities in Niger State, Nigeria: Federal University of Technology, Minna; Ibrahim Badamasi Babangida University, Lapai; Federal University of Education, Kontagora; and Abdulkadir Kure University, Minna. According to personnel records obtained from the respective university libraries as of November 2024, the total population was 196 library staff members across all categories and ranks. Using Taro Yamane's formula for determining sample size at 95% confidence level and 0.05 margin of error, a sample size of 168 was calculated, representing 85.7% of the total population (Yamane, 1967). A stratified proportionate random sampling technique was employed to ensure adequate representation from each institution based on their respective staff sizes: Federal University of Technology, Minna (68 respondents), Ibrahim Badamasi Babangida University, Lapai (42 respondents), Federal University of Education, Kontagora (38 respondents), and Abdulkadir Kure University, Minna (20 respondents).

Instrument for Data Collection

A structured questionnaire titled "Digital Library Implementation Assessment Questionnaire (DLIAQ)" was developed specifically for this study. The questionnaire consisted of six sections: Section A gathered demographic data including institution, staff category, years of experience, educational qualification, and ICT training background; Section B assessed awareness and current implementation status of various digital library services using a checklist and 4-point Likert scale (Fully Implemented = 4, Partially Implemented = 3, Planned but Not Implemented = 2, Not Planned = 1); Section C examined challenges to digital library implementation using a 4-point scale (Strongly Agree = 4, Agree = 3, Disagree = 2, Strongly Disagree = 1); Section D explored opportunities for digital library advancement using a similar 4-point scale; Section E assessed staff competencies in digital library technologies; and Section F solicited open-ended suggestions for improving digital library services. The instrument was designed to be comprehensive yet concise, requiring approximately 20-25 minutes for completion to encourage high response rates.

Data collected were coded, cleaned, and analyzed using Statistical Package for Social Sciences (SPSS) version 27.0. Descriptive statistics including frequencies, percentages, means, and standard deviations were computed to summarize demographic characteristics, implementation levels, challenges, and opportunities. Mean scores were interpreted using the following criterion: 3.50-4.00 = Very High/Strongly Agree; 2.50-3.49 = High/Agree; 1.50-2.49 = Low/Disagree; 1.00-1.49 = Very Low/Strongly Disagree (Nworgu, 2015). Chi-square test of independence was used to examine associations between categorical variables such as institutional type, staff category, and level of digital library implementation at 0.05 significance level. One-

way Analysis of Variance (ANOVA) was employed to test for significant differences in perceptions of challenges and opportunities across different institutions and staff categories, with post-hoc tests conducted where significant F-values were obtained (Pallant, 2020). Qualitative data from open-ended questions were analyzed thematically to identify recurring themes and representative quotations that enriched the quantitative findings.

Results and Discussion

Demographic Characteristics of Respondents

The analysis of demographic data revealed that Federal University of Technology, Minna, contributed the largest number of respondents (63, 40.9%), followed by Ibrahim Badamasi Babangida University, Lapai (39, 25.3%), Federal University of Education, Kontagora (34, 22.1%), and Abdulkadir Kure University, Minna (18, 11.7%), reflecting the proportionate stratified sampling strategy employed. Regarding staff category, professional librarians constituted 52.6% (81 respondents), paraprofessionals 31.8% (49 respondents), and library assistants 15.6% (24 respondents), indicating that the majority of respondents possessed professional qualifications relevant to digital library management (Emezie & Nwaohiri, 2013). Years of experience showed that 35.7% had 6-10 years of experience, 28.6% had 1-5 years, 22.1% had 11-15 years, and 13.6% had over 15 years, suggesting a workforce with moderate to substantial professional maturity. Educational qualifications revealed that 48.7% held master's degrees in library and information science, 33.1% possessed bachelor's degrees, 11.0% had diploma qualifications, and 7.2% held doctoral degrees, aligning with qualification structures typical of Nigerian university libraries (Nwachukwu et al., 2020). Regarding ICT training, 67.5% reported having attended at least one formal training program on digital library technologies, while 32.5% had no formal ICT training beyond their academic programs, highlighting a training gap that could affect implementation effectiveness. Gender distribution showed 58.4% male and 41.6% female respondents, reflecting the male dominance observed in Nigerian academic librarianship generally (Quadri & Adetimirin, 2015).

Research Question 1: Current Level of Digital Library Service Implementation

Table 1: Level of Digital Library Service Implementation (N=145)

Digital Library Service	Fully Implemented	Partially Implemented	Planned Not Implemented	Not Planned	Mean	SD	Remark
Integrated library management system (ILMS)	42 (27.3%)	76 (49.4%)	24 (15.6%)	12 (7.8%)	2.96	0.87	High
Electronic journals/databases	51 (33.1%)	74 (48.1%)	19 (12.3%)	10 (6.5%)	3.08	0.84	High
Institutional repository	38 (24.7%)	80 (51.9%)	26 (16.9%)	10 (6.5%)	2.95	0.82	High
Digital reference services	22 (14.3%)	58 (37.7%)	48 (31.2%)	26 (16.9%)	2.49	0.95	Low
Online public access catalog (OPAC)	48 (31.2%)	71 (46.1%)	23 (14.9%)	12 (7.8%)	3.01	0.88	High
Digital archives/special collections	18 (11.7%)	52 (33.8%)	56 (36.4%)	28 (18.2%)	2.39	0.92	Low
Mobile library applications	12 (7.8%)	38 (24.7%)	62 (40.3%)	42 (27.3%)	2.13	0.92	Low
Virtual/chat reference services	8 (5.2%)	32 (20.8%)	58 (37.7%)	56 (36.4%)	1.95	0.90	Low
E-learning integration	26 (16.9%)	64 (41.6%)	42 (27.3%)	22 (14.3%)	2.61	0.94	High
Digital preservation systems	14 (9.1%)	44 (28.6%)	58 (37.7%)	38 (24.7%)	2.22	0.93	Low

Overall Implementation Level					2.58	0.72	High

Table 1 presents the current level of digital library service implementation across academic libraries in Niger State universities. The overall mean implementation score of 2.58 (SD = 0.72) indicates a high but not optimal level of implementation, suggesting that while digital library services have been adopted, most remain in partial rather than full implementation stages. Electronic journals/databases recorded the highest implementation level (Mean = 3.08, SD = 0.84), which aligns with findings by Adeniran (2013) that subscription to electronic resources through consortia like NULIB has been the most successful digital library initiative in Nigerian universities due to cost-sharing benefits and vendor support. Online public access catalog (Mean = 3.01) and integrated library management systems (Mean = 2.96) also showed high implementation levels, reflecting the foundational nature of these services and their prioritization in library automation efforts, consistent with observations by Emezie and Nwaohiri (2013) that automation of core library processes typically precedes more advanced digital services. Institutional repositories showed high but incomplete implementation (Mean = 2.95), with 51.9% of respondents indicating partial implementation, suggesting that while many institutions have established repositories, challenges related to content recruitment, sustainability, and full operational capacity remain, as documented by Bamigbola (2014) in Nigerian contexts. Conversely, virtual/chat reference services (Mean = 1.95), mobile library applications (Mean = 2.13), and digital preservation systems (Mean = 2.22) showed low implementation levels, indicating that these more advanced services have not yet been prioritized or have been constrained by technical and resource limitations (Thanuskodi, 2012). The findings reveal a pattern of selective implementation where basic automation and access to external electronic resources have progressed relatively well, while locally-generated digital services and user-centered innovations remain underdeveloped.

Research Question 2: Challenges Hindering Digital Library Implementation

Table 2: Challenges Hindering Digital Library Implementation (N=145)

Challenge	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	SD	Remark
Inadequate funding for digital infrastructure	84 (54.5%)	52 (33.8%)	12 (7.8%)	6 (3.9%)	3.42	0.79	Agree
Poor internet connectivity and bandwidth	78 (50.6%)	58 (37.7%)	14 (9.1%)	4 (2.6%)	3.38	0.74	Agree
Insufficient ICT infrastructure	76 (49.4%)	56 (36.4%)	16 (10.4%)	6 (3.9%)	3.35	0.79	Agree
Lack of technical expertise among staff	68 (44.2%)	62 (40.3%)	18 (11.7%)	6 (3.9%)	3.29	0.80	Agree
Erratic power supply	72 (46.8%)	56 (36.4%)	20 (13.0%)	6 (3.9%)	3.28	0.82	Agree
High cost of proprietary software	62 (40.3%)	68 (44.2%)	18 (11.7%)	6 (3.9%)	3.25	0.78	Agree
Inadequate training opportunities	58 (37.7%)	72 (46.8%)	18 (11.7%)	6 (3.9%)	3.22	0.77	Agree
Insufficient management support	52 (33.8%)	68 (44.2%)	26 (16.9%)	8 (5.2%)	3.12	0.84	Agree
Resistance to change among staff	46 (29.9%)	72 (46.8%)	28 (18.2%)	8 (5.2%)	3.05	0.83	Agree
Lack of institutional digital library policy	48 (31.2%)	68 (44.2%)	30 (19.5%)	8 (5.2%)	3.04	0.84	Agree
Low user awareness and digital literacy	44 (28.6%)	76 (49.4%)	26 (16.9%)	8 (5.2%)	3.03	0.81	Agree
Rapid technological obsolescence	42 (27.3%)	72 (46.8%)	32 (20.8%)	8 (5.2%)	2.99	0.83	Agree

Security and privacy concerns	38 (24.7%)	74 (48.1%)	32 (20.8%)	10 (6.5%)	2.95	0.84	Agree
Limited collaboration among libraries	36 (23.4%)	76 (49.4%)	34 (22.1%)	8 (5.2%)	2.94	0.81	Agree
Overall Mean					3.17	0.68	Agree

Table 2 reveals the challenges hindering effective implementation of digital library services in Niger State academic libraries, with an overall mean of 3.17 (SD = 0.68) indicating strong agreement that these factors constitute significant barriers. Inadequate funding emerged as the most critical challenge (Mean = 3.42, SD = 0.79), with 88.3% of respondents agreeing or strongly agreeing, which corroborates extensive literature documenting financial constraints as the primary impediment to digital library development in African contexts (Nwezeh, 2010; Mutula, 2012). Poor internet connectivity and bandwidth (Mean = 3.38) ranked second, reflecting Nigeria's broader digital infrastructure deficits where internet penetration remains low and connection speeds often inadequate for accessing bandwidth-intensive databases, as documented by Ani et al. (2016) in their study of Nigerian university libraries.

Insufficient ICT infrastructure (Mean = 3.35) encompasses hardware deficits including inadequate computer workstations, servers, digitization equipment, and networking infrastructure, representing substantial capital investments beyond the capacity of most libraries' budgets (Akpojotor, 2016). The lack of technical expertise (Mean = 3.29) highlights human resource challenges, as many library staff lack specialized skills in systems administration, database management, and digital preservation required for sophisticated digital library operations, consistent with findings by Okello-Obura and Kigongo-Bukenya (2011). Organizational and cultural challenges including insufficient management support (Mean = 3.12), resistance to change (Mean = 3.05), and lack of institutional policies (Mean = 3.04) suggest that successful digital library implementation requires addressing human and organizational dimensions through change management strategies and policy frameworks (Okpe et al., 2018).

Research Question 3: Opportunities for Advancing Digital Library Services

Table 3: Opportunities for Advancing Digital Library Services (N=145)

Opportunity	Strongly Agree	Agree	Disagree	Strongly Disagree	Mean	SD	Remark
Enhanced access to global information resources	88 (57.1%)	54 (35.1%)	8 (5.2%)	4 (2.6%)	3.51	0.71	Strongly Agree
Improved user satisfaction and experience	82 (53.2%)	58 (37.7%)	10 (6.5%)	4 (2.6%)	3.46	0.73	Agree
Increased research productivity	78 (50.6%)	62 (40.3%)	10 (6.5%)	4 (2.6%)	3.44	0.72	Agree
24/7 access to library resources	76 (49.4%)	64 (41.6%)	10 (6.5%)	4 (2.6%)	3.42	0.71	Agree
Support for distance learning programs	74 (48.1%)	62 (40.3%)	14 (9.1%)	4 (2.6%)	3.38	0.74	Agree
Resource sharing through consortia	72 (46.8%)	60 (39.0%)	18 (11.7%)	4 (2.6%)	3.33	0.76	Agree
Preservation of unique local content	66 (42.9%)	68 (44.2%)	16 (10.4%)	4 (2.6%)	3.31	0.74	Agree
Cost savings on print materials	64 (41.6%)	66 (42.9%)	18 (11.7%)	6 (3.9%)	3.27	0.79	Agree
Enhanced institutional visibility	62 (40.3%)	68 (44.2%)	18 (11.7%)	6 (3.9%)	3.25	0.78	Agree
Improved workflow efficiency	58 (37.7%)	72 (46.8%)	18 (11.7%)	6 (3.9%)	3.23	0.78	Agree

Overall Mean					3.32	0.66	Agree

Table 3 presents opportunities available for advancing digital library services in Niger State academic libraries, with an overall mean of 3.32 (SD = 0.66) indicating strong agreement that digital libraries offer substantial benefits. Enhanced access to global information resources emerged as the most recognized opportunity (Mean = 3.51, SD = 0.71), with 92.2% agreement, reflecting the core value proposition of digital libraries in eliminating geographical barriers and providing access to international scholarly content (Tella et al., 2009). Improved user satisfaction (Mean = 3.46) and increased research productivity (Mean = 3.44) demonstrate recognition that digital library services directly support institutional missions by facilitating more efficient information discovery and utilization (Thanuskodi, 2012).

The opportunity for 24/7 access (Mean = 3.42) represents a fundamental advantage of digital libraries, enabling users to retrieve resources at anytime from any location with internet connectivity (Breeding, 2016). Resource sharing through consortia (Mean = 3.33) offers opportunities for libraries to pool resources and provide access to larger collections than individual institutions could afford independently, a strategy successfully employed by NULIB in Nigeria (Okiy, 2010). Preservation of unique local content (Mean = 3.31) represents a significant opportunity where institutional repositories can safeguard theses, dissertations, and cultural heritage materials while increasing their visibility to global researchers (Bamigbola, 2014).

Additional Analysis: Association between Institutional Type and Implementation Level

Table 4: Chi-Square Test of Association between Institution Type and Digital Library Implementation Level (N=154)

Institution	**High Implementation (≥2.50)**	**Low Implementation (<2.50)**	**Total**	**χ^2**	**df**	**p-value**
Federal University of Technology, Minna	46 (73.0%)	17 (27.0%)	63	18.47	3	0.001**
Ibrahim Badamasi Babangida University, Lapai	27 (69.2%)	12 (30.8%)	39			
Federal University of Education, Kontagora	16 (47.1%)	18 (52.9%)	34			
Abdulkadir Kure University, Minna	8 (44.4%)	10 (55.6%)	18			
Total	97 (63.0%)	57 (37.0%)	154			

**$p < 0.01$

Table 4 presents the chi-square analysis examining the association between institutional type and level of digital library implementation. The results reveal a statistically significant relationship ($\chi^2 = 18.47$, df = 3, $p < 0.01$), indicating that digital library implementation levels vary significantly across the four universities in Niger State. Federal University of Technology, Minna, showed the highest proportion of high implementation (73.0%), followed by Ibrahim Badamasi Babangida University, Lapai (69.2%), while state-owned institutions demonstrated lower implementation levels. This pattern aligns with findings by Adeniran (2013) that federal universities in Nigeria generally achieve better digital library implementation compared to state institutions, attributed to more stable and higher funding allocations, better infrastructure, and access to consortium benefits. These findings suggest that targeted interventions and support may be needed for state universities to achieve parity in digital library service delivery (Echezona & Ugwuanyi, 2010).

Summary of Findings

The study revealed that digital library services in Niger State academic libraries are at a moderate implementation level (Mean = 2.58), with basic services such as electronic journals/databases (Mean = 3.08), online public access catalogs (Mean = 3.01), and integrated library management systems (Mean = 2.96) showing higher adoption than advanced services like virtual reference (Mean = 1.95) and mobile applications (Mean = 2.13). The demographic analysis indicated that 52.6% of respondents were professional librarians,

48.7% held master's degrees, and 67.5% had received formal ICT training, suggesting a reasonably qualified workforce with capacity-building needs in specialized digital library competencies.

The most critical challenges identified were inadequate funding (Mean = 3.42), poor internet connectivity (Mean = 3.38), insufficient ICT infrastructure (Mean = 3.35), lack of technical expertise (Mean = 3.29), and erratic power supply (Mean = 3.28), with an overall challenge mean of 3.17 indicating strong agreement on these barriers. Significant opportunities recognized included enhanced access to global information resources (Mean = 3.51), improved user satisfaction (Mean = 3.46), increased research productivity (Mean = 3.44), 24/7 access (Mean = 3.42), and resource sharing through consortia (Mean = 3.33), with an overall opportunity mean of 3.32. Chi-square analysis revealed significant associations between institutional type and implementation levels ($\chi^2 = 18.47$, $p < 0.01$), with federal universities achieving higher implementation compared to state institutions, reflecting resource disparities in Nigerian higher education.

Conclusion

This study has provided comprehensive empirical evidence on the challenges and opportunities of implementing digital library services in academic libraries in Niger State universities. The findings reveal a transitional implementation stage where basic automation and access to external resources have progressed moderately, while advanced user-centered services remain underdeveloped. The identification of inadequate funding, poor connectivity, infrastructure deficits, and technical capacity gaps as primary challenges underscores the need for increased investment and innovative resource mobilization approaches. The strong recognition of opportunities demonstrates awareness among library staff of digital library benefits and provides motivation for advancement despite significant barriers. Successful digital library implementation requires holistic strategies addressing technology, infrastructure, human capacity, organizational culture, supportive policies, and collaborative arrangements simultaneously.

Recommendations

Based on the findings and aligned with the research objectives, the following recommendations are made:

1. University administrations should increase budgetary allocations specifically for digital library infrastructure including servers, bandwidth upgrades, digitization equipment, and backup power systems. Libraries should explore alternative funding through donor support and grant programs while adopting cost-effective open-source platforms to reduce dependence on expensive proprietary software. This addresses the moderate implementation level and provides resources to move services from partial to full implementation.

2. Library management should establish comprehensive professional development programs providing practical training in systems administration, database management, and digital preservation. Institutions should develop change management strategies and invest in reliable internet infrastructure and alternative power solutions. These interventions directly tackle identified challenges of inadequate technical expertise, insufficient training, poor connectivity, and erratic power supply.

3. Universities should formulate institutional digital library policies mandating research output deposits and establishing quality standards. State governments should increase funding to state universities to reduce disparities, while libraries should pursue collaborative arrangements through consortia participation and resource-sharing agreements. These strategic interventions maximize identified opportunities of enhanced access, improved satisfaction, and resource sharing while addressing policy gaps and limited collaboration challenges.

Abstract

This study examined the challenges in accessing electronic health information resources in Nigerian medical libraries, using Nnamdi Azikiwe Teaching Hospital (NAUTH) as a case study. The study adopted a descriptive survey research design. The study was covered with two specific objectives to- examine the extent to which electronic health information resources are accessed and utilized by users in the hospital and to investigate the challenges faced by users in accessing electronic health information resources in the medical library. The population comprised 1,200 healthcare professionals, including medical librarians, doctors, nurses, and other allied health personnel who utilize the medical library. A sample size of 300 respondents was selected using stratified, proportionate, and simple random sampling techniques. Data were collected using a structured questionnaire and analyzed using frequency counts, percentages. The findings revealed that electronic health information resources such as e-journals, online databases, and e-books are available in the medical library; however, they are not adequate to meet users' needs. The major challenges identified to be the hindrances include poor internet connectivity, erratic power supply, inadequate ICT infrastructure, limited subscription to electronic databases, lack of user training, high cost of access, and insufficient technical support. More so, the study revealed a gap between the availability of electronic resources and their effective utilization. Respondents strongly agreed on several strategies for improving access, including increased funding, improved ICT infrastructure, reliable internet connectivity, regular training for users, enhanced awareness programs, and the development of flexible access policies. The study concludes that although electronic health information resources are available, significant infrastructural, financial, and technical barriers hinder effective access and utilization. It recommends increased institutional investment in ICT infrastructure, improved funding for electronic resource subscriptions, continuous user training, and supportive policy frameworks to enhance access and promote evidence-based healthcare practice in Nigerian teaching hospitals.

Keywords: Electronic Health Information Resources; Medical Libraries; Access Challenges; Healthcare Information Services; Nigerian Teaching Hospitals.

Introduction

Access to reliable and up-to-date health information is a fundamental requirement for effective healthcare delivery, research advancement, and evidence-based clinical decision-making. In the digital age, electronic health information resources—such as online databases, e-journals, institutional repositories, and clinical decision support systems—have become indispensable tools in modern medical practice (Adeleke&Nwalo, 2017). These resources provide healthcare professionals with timely access to current medical knowledge, thereby enhancing the quality of patient care and supporting continuous professional development.

Medical libraries, particularly in teaching hospitals, serve as critical hubs for the acquisition, organization, and dissemination of these electronic resources. In Nigeria, institutions such as Nnamdi Azikiwe University Teaching Hospital play a vital role in supporting healthcare practitioners, including doctors, nurses, and allied health professionals, by facilitating access to essential medical information. However, despite the recognized importance of electronic health information resources, their accessibility and utilization remain a significant challenge in many Nigerian medical libraries (Ojo & Akande, 2019).

Several studies have highlighted that developing countries, including Nigeria, face persistent barriers in the effective deployment and use of electronic information systems in healthcare settings. These challenges often stem from inadequate information and communication technology (ICT) infrastructure, unreliable internet connectivity, and insufficient funding for resource acquisition and maintenance (Oladokun, 2015). Furthermore, limited subscription to

relevant medical databases restricts the scope of information available to users, thereby constraining research output and clinical efficiency.

In addition to infrastructural constraints, human factors also play a critical role in limiting access to electronic health information resources. Studies have shown that low levels of information literacy and inadequate user training significantly hinder the effective utilization of digital resources among healthcare professionals (Aina, 2014). Many users are either unaware of the available electronic resources or lack the necessary skills to navigate and retrieve relevant information efficiently. This situation is further exacerbated by restrictive access policies and poor awareness strategies within medical libraries.

The implications of these challenges are far-reaching. Limited access to electronic health information resources can negatively affect healthcare delivery by reducing the ability of practitioners to make informed clinical decisions based on current evidence. It also hampers research productivity and innovation within the medical community, ultimately impacting the overall quality of healthcare services (Ezeani & Ezema, 2011). In teaching hospitals, where research and training are integral components of healthcare provision, these limitations pose a serious threat to academic and professional excellence.

Given these concerns, there is a pressing need to systematically examine the specific challenges associated with accessing electronic health information resources in Nigerian medical libraries. This study focuses on Nnamdi Azikiwe Teaching Hospital as a case study, aiming to provide empirical insights into the barriers faced by users and the implications for healthcare delivery and research. By identifying these challenges, the study seeks to contribute to the development of strategic interventions that will enhance access to electronic resources, strengthen medical library services, and promote evidence-based healthcare practices in Nigeria.

Ultimately, improving access to electronic health information resources requires a comprehensive approach involving adequate ICT infrastructure, sustainable funding for electronic resource acquisition, continuous information literacy training, and supportive institutional policies (IFLA, 2021; World Health Organization, 2021). Such interventions are essential for enhancing the accessibility, utilization, and effectiveness of electronic health information resources and for ensuring that medical libraries continue to support evidence-based healthcare delivery and professional practice in the twenty-first century (Aina, 2014; UNESCO, 2020).

Statement of the Problem

The integration of electronic health information resources into medical library services has transformed the way healthcare professionals access, retrieve, and apply information in clinical practice, research, and education. These resources are expected to enhance evidence-based medical practice by providing timely and accurate information for diagnosis, treatment, and patient care. However, despite the increasing availability of digital information systems, effective access to electronic health information resources remains a major challenge in many Nigerian medical libraries, including the medical library of Nnamdi Azikiwe Teaching Hospital. In an ideal healthcare environment, medical professionals such as doctors, nurses, and allied health workers should have seamless access to relevant and up-to-date electronic resources to support clinical decision-making and research activities. Unfortunately, in many Nigerian teaching hospitals, access to these resources is often constrained by a number of persistent challenges. These include inadequate information and communication technology (ICT) infrastructure, erratic power supply, poor and unreliable internet connectivity, and limited institutional funding for the acquisition and subscription of relevant electronic databases. As a result, many healthcare professionals are unable to fully utilize available electronic resources, thereby limiting their capacity to deliver high-quality healthcare services. More so, low levels of awareness and insufficient user training contribute significantly to the problem. Many users are either unaware of the existence of certain electronic health information resources or lack the necessary information literacy skills required to effectively search, retrieve, and evaluate digital information. This situation is compounded by restrictive access policies and inadequate user support services within medical libraries, which further hinder effective utilization. The consequences of these challenges are far-reaching. Limited access to electronic health information resources can lead to reliance on outdated or incomplete information, which may negatively impact clinical decision-making and patient outcomes. It also reduces research productivity among healthcare professionals and limits opportunities for continuous professional development. In teaching hospitals, where training and research are core mandates, such limitations undermine the institution's ability to achieve academic excellence and deliver quality healthcare services. Despite the critical importance of electronic health information resources, there is still a gap in empirical studies that comprehensively examine the specific access challenges faced by users in Nigerian medical libraries, particularly in the context of Nnamdi Azikiwe Teaching Hospital. This gap makes it difficult for hospital administrators, librarians, and policymakers to develop targeted interventions that address these challenges effectively. It is against this backdrop that this study seeks to investigate the challenges associated with accessing electronic health information resources in the medical library of Nnamdi Azikiwe Teaching Hospital. By identifying the nature and extent of these challenges, the study aims to provide evidence-based recommendations that will improve access to electronic resources, enhance medical library services, and ultimately support better healthcare delivery and research outcomes in Nigerian teaching hospitals.

Objective of the study

The following specific objectives guided the study:

1. Examine the extent to which electronic health information resources are accessed and utilized by users in the hospital;
2. Investigate the challenges faced by users in accessing electronic health information resources in the medical library;

Research Questions

1. To what extent are electronic health information resources accessed and utilized by users in Nnamdi Azikiwe Teaching Hospital?
2. What challenges do users face in accessing electronic health information resources in the medical library of Nnamdi Azikiwe Teaching Hospital?

Review of Related Literature

The literature on access to electronic health information resources in medical libraries has expanded significantly due to the increasing adoption of digital technologies in healthcare systems. This review examines existing studies under relevant themes such as availability of electronic resources, accessibility and utilization, challenges of access, and implications for healthcare delivery, with particular reference to Nigerian medical libraries.

Accessibility and Utilization of Electronic Health Information Resources

Accessibility to electronic health information resources is a critical factor in supporting evidence-based healthcare practice and informed clinical decision-making. Electronic health information resources include online databases, electronic journals, e-books, institutional repositories, and other digital information sources that provide healthcare professionals with current and reliable medical information. The extent to which these resources are accessed and utilized depends on their availability, ease of access, user awareness, and the technological infrastructure supporting their use.

Studies have shown that access to electronic health information resources has improved healthcare delivery by enabling medical practitioners to obtain current and evidence-based information for patient care. According to Ogwo and Nwachukwu (2018), the availability of electronic resources in selected Nigerian medical libraries remains relatively low when compared to international standards, thereby limiting access among users. However, where such resources are available, healthcare professionals increasingly rely on them for research, diagnosis, treatment decisions, and professional development.

Research by Popoola, Uzoagba, and Rabiu (2020) revealed that although electronic resources were available in some medical libraries, their utilization varied considerably among users. The study attributed differences in utilization levels to factors such as awareness, accessibility, computer literacy, and institutional support. Similarly, healthcare professionals who possess adequate information literacy skills tend to utilize electronic resources more effectively than those with limited digital competencies.

More so, Ikolo et al. (2025) observed that medical libraries in Nigeria have increasingly incorporated electronic resources and internet-based services into their collections. These resources provide users with opportunities to access current medical literature, clinical guidelines, and research findings regardless of geographical location. Nevertheless, accessibility remains dependent on the adequacy of technological facilities and users' ability to navigate digital information systems effectively. The literature therefore suggests that while electronic health information resources are increasingly available in medical libraries, the extent of access and utilization varies among users and institutions. Factors such as awareness, digital literacy, availability of resources, and institutional support significantly influence the level of utilization.

Challenges in Accessing Electronic Health Information Resources

Irrespective of the growing importance of electronic health information resources, users continue to encounter numerous barriers in accessing and utilizing them effectively. These challenges can be categorized into infrastructural, financial, technical, and organizational factors.

- **Infrastructural Challenges**

  Inadequate ICT infrastructure, poor internet connectivity, and unreliable power supply are among the most frequently reported barriers to access. Studies indicate that unstable electricity supply and limited internet bandwidth significantly reduce users' ability to access electronic resources efficiently (Ogwo & Nwachukwu, 2018). These challenges are particularly prevalent in developing countries where technological infrastructure remains inadequate.

- **Financial Constraints**

  Limited funding continues to affect the acquisition and sustainability of electronic health information resources. Anyaoku (2013) identified inadequate funding as a major challenge confronting the development of hybrid

libraries in Nigeria. High subscription costs for electronic databases and journals often prevent medical libraries from providing comprehensive access to essential health information resources. Similarly, Ikolo et al. (2025) reported that financial constraints limit the acquisition of both physical and electronic resources in hospital libraries.

- **Technical and Skill-Related Challenges**

  The effective use of electronic resources requires adequate ICT and information literacy skills. However, many users lack the necessary competencies to navigate electronic databases and online information systems effectively. In addition, insufficient training opportunities and shortages of skilled ICT personnel contribute to difficulties in accessing and utilizing electronic resources (Ogwo & Nwachukwu, 2018).

- **Organizational and Policy Challenges**

  Organizational barriers such as restrictive access policies, inadequate institutional support, and limited collaboration among libraries further hinder access to electronic health information resources. Popoola et al. (2020) noted that the absence of structured user education programmes and inadequate interlibrary cooperation reduce the effectiveness of resource sharing and information access within medical libraries.

Literature Gap

In as much as several studies have examined electronic health information resources in Nigerian libraries, limited empirical research has focused specifically on the extent of access and utilization of these resources and the challenges associated with their use within individual teaching hospitals such as Nnamdi Azikiwe Teaching Hospital, Nnewi. Most existing studies provide broad national or regional perspectives without examining the peculiar circumstances of specific medical institutions. This study therefore seeks to fill this gap by investigating the extent to which users' access and utilize electronic health information resources and the challenges affecting such access within Nnamdi Azikiwe Teaching Hospital Medical Library.

Implications of Access Challenges

The literature reveals that challenges in accessing electronic health information resources have serious implications for healthcare delivery. Limited access to current medical information can lead to poor clinical decisions, reduced research productivity, and ineffective patient care.

In addition, the inability to utilize electronic resources undermines the adoption of evidence-based practice, which is essential for improving healthcare outcomes. Studies on health information systems in Nigeria also indicate that poor ICT infrastructure and system inefficiencies can negatively affect healthcare services and patient satisfaction (Babatope et al., 2024).

Methodology

The study adopted a descriptive survey research design. This design was considered appropriate because it enabled the researcher to collect quantitative data from respondents on the availability of electronic health information resources and the challenges associated with accessing these resources in the medical library of Nnamdi Azikiwe Teaching Hospital. The design also facilitated the description and analysis of existing conditions as perceived by the respondents.

The study was conducted at the Medical Library of Nnamdi Azikiwe Teaching Hospital, a major tertiary healthcare institution that supports clinical practice, teaching, and research activities. The medical library was selected because it serves as an important source of health information for healthcare professionals and provides access to a variety of electronic information resources.

The population of the study comprised 1,200 healthcare professionals, including doctors, nurses, medical librarians, and other allied health personnel who utilize the medical library. These categories of respondents were considered suitable because they are the primary users of electronic health information resources and are directly affected by factors influencing access and utilization. A sample size of 300 respondents was selected from the population. A multi-stage sampling technique involving stratified, proportionate, and simple random sampling methods was adopted. The population was first stratified into doctors, nurses, medical librarians, and other healthcare professionals. Proportionate sampling was then used to determine the number of respondents selected from each stratum according to their population sizes. Thereafter, simple random sampling was employed to select respondents from each group. Total enumeration was used for medical librarians because of their relatively small number. A structured questionnaire served as the instrument for data collection. The questionnaire consisted of two sections. The first section elicited information on the availability of electronic health information resources in the medical library, while the second section focused on the challenges users encounter in accessing these resources. The questionnaire items were structured using dichotomous response options of **Available/Not Available** and **Yes/No**, as appropriate to each research question. The instrument was administered to the 300 selected respondents, and all copies were successfully completed and returned, representing a 100% response rate. Data collected were analyzed using descriptive statistics, specifically frequency counts and percentages. The results were presented in tables and interpreted according to the frequency and percentage distributions. The analysis focused on identifying the types of electronic health information resources available in the medical library and examining the challenges faced by users in accessing these resources.

Results of the Findings

Research question 1: What types of electronic health information resources are available in the medical library of Nnamdi Azikiwe Teaching Hospital?

S/N	Electronic Health Information Resources	Available f (%)	Not Available f (%)
1	E-journals	210 (70.0%)	90 (30.0%)
2	Online medical databases	190 (63.3%)	110 (36.7%)
3	E-books	170 (56.7%)	130 (43.3%)
4	Internet facilities	150(50.0%)	150 (50.0%)
5	Institutional Repositories	130 (43.3%)	170 (56,7%)
6	Adequate Access to electronic Resources	110 (36.7%)	190 (63.3%)

Table 1: The data show that e-journals were the most available electronic health information resource, as indicated by 210 respondents (70.0%). This was followed by online medical databases, reported as available by 190 respondents (63.3%), and e-books, identified by 170 respondents (56.7%). Internet facilities were reported as available by 150 respondents (50.0%). However, a majority of respondents indicated that institutional repositories were not available (56.7%), while 190 respondents (63.3%) reported that there was no adequate access to electronic resources in the library.

Interpretation:

The results indicate that key electronic health information resources such as e-journals, online medical databases, and e-books are available in the medical library. However, the findings also reveal inadequacies in internet facilities, institutional repositories, and overall access to electronic resources. This suggests that although electronic resources exist within the library, users may not be able to access and utilize them effectively due to infrastructural and accessibility constraints. Consequently, the full benefits of these resources for healthcare delivery, research, and learning may not be fully realized.

Research Question 2: What challenges do users face in accessing electronic health information resources in the medical library of Nnamdi Azikiwe Teaching Hospital?

Table 2: Challenges faced by users in accessing electronic health information resources (YES/NO scale)

S/N	Challenges Faced by Users	Yes (n)	NO (n)	Percentages (%)	Remarks
1	Poor internet connectivity affects access to electronic resources	250	50	83.3	yes
2	Inadequate ICT infrastructure limits access	250	50	83.3	yes
3	Lack of awareness hinders effective utilization	190	110	63.3	yes
4	Lack of user training affects access to electronic resources	230	70	76.7	yes
5	Limited subscription to databases restricts access	240	60	80.0	yes
6	Erratic power supply affects usage of electronic resources	260	40	86.7	yes
7	Restrictive access policies limit availability	220	80	73.3	yes
8	High cost of accessing electronic resources is a barrier	220	80	73.3	yes
9	Lack of technical support affects access				

In table 2, the data show that respondents overwhelmingly identified multiple barriers affecting access to electronic health information resources in the medical library. The most prominent challenge is erratic power supply (86.7%), followed by poor internet connectivity and inadequate ICT infrastructure (83.3% each). Other significant challenges include limited database subscriptions (80.0%), lack of technical support (76.7%), and user training gaps (76.7%).

Interpretation

The findings indicate that users experience multi-dimensional constraints, including infrastructural, financial, and human capacity-related challenges. These factors collectively reduce effective access and utilization of electronic health information resources, thereby limiting their contribution to healthcare service delivery and research productivity.

Discussion of the Findings

The findings of the study revealed that:

Types of Electronic Health Information Resources Available in the Medical Library of Nnamdi Azikiwe Teaching Hospital

The findings of the study revealed that several electronic health information resources are available in the medical library of Nnamdi Azikiwe Teaching Hospital. The resources identified include e-journals, online medical databases, e-books, internet facilities, and institutional repositories. Among these resources, e-journals were reported as the most available, followed by online medical databases and e-books. This finding indicates that the medical library has adopted important electronic information resources capable of supporting healthcare delivery, medical research, and academic activities. The availability of e-journals and online medical databases is particularly important because they provide access to current and evidence-based medical information required by healthcare professionals and researchers. Irrespective of the availability of these resources, the findings showed that institutional repositories were less available and that a majority of respondents reported inadequate access to electronic resources. Internet facilities were also reported as only moderately available. This suggests that although electronic health information resources exist in the library, users may experience difficulties accessing them effectively. Consequently, the potential benefits of these resources may not be fully realized. The findings therefore indicate that the availability of electronic health information resources in the medical library is relatively encouraging, but adequate access to these resources remains a major concern.

Challenges Faced by Users in Accessing Electronic Health Information Resources in the Medical Library of Nnamdi Azikiwe Teaching Hospital

The findings further revealed that users face several challenges in accessing electronic health information resources in the medical library. The most prominent challenge identified was erratic power supply, followed by poor internet connectivity and inadequate ICT infrastructure. These findings suggest that infrastructural challenges constitute major barriers to effective access and utilization of electronic health information resources. Since electronic resources depend heavily on electricity and internet connectivity, deficiencies in these facilities significantly affect users' ability to retrieve and utilize information resources.

The study also revealed that limited subscription to databases restricts users' access to relevant electronic health information resources. In addition, lack of user training and inadequate technical support were identified as major challenges affecting access and utilization. These findings indicate that users may encounter difficulties in locating, retrieving, and effectively utilizing available electronic resources without adequate guidance and support. Furthermore, restrictive access policies and the high cost associated with accessing electronic resources were reported as significant barriers. The findings therefore demonstrate that users face a combination of infrastructural, financial, administrative, and user-support challenges that limit effective access to electronic health information resources in the medical library. These challenges collectively reduce the ability of users to fully utilize available electronic resources for healthcare delivery, research, and learning purposes.

Conclusion

Based on the findings of the study, it is concluded that although electronic health information resources such as e-journals, online medical databases, and e-books are available in the medical library of Nnamdi Azikiwe Teaching Hospital, access to these resources is not fully effective. The study established that users experience significant challenges in accessing electronic health information resources, particularly erratic power supply, poor internet connectivity, inadequate ICT infrastructure, limited database subscriptions, and insufficient technical support.

These challenges indicate that access remains a major constraint, limiting the extent to which users can retrieve and utilize available electronic resources. As a result, the effectiveness of electronic health information resources in supporting healthcare delivery, research, and decision-making is reduced. The study therefore concludes that improving access conditions is critical to enhancing the use of electronic health information resources in the medical library.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are made to improve accessibility and access to electronic health information resources in the medical library of Nnamdi Azikiwe Teaching Hospital:

1. **Improvement of Accessibility through Reliable Internet Services**

   The management of Nnamdi Azikiwe Teaching Hospital should provide high-speed and stable internet connectivity to ensure effective accessibility to electronic health information resources such as e-journals, databases, and e-books.

2. **Enhancement of ICT Infrastructure for Better Access**

   The hospital should upgrade its ICT infrastructure, including functional computers, servers, and networking systems, to improve user accessibility to electronic health information resources.

3. **Improved Accessibility through Stable Power Supply**

   Alternative power sources such as generators and solar systems should be provided to ensure uninterrupted access to electronic health information resources.

4. **Expansion of Database Subscriptions to Improve Resource Access**

   Adequate funding should be provided to subscribe to more up-to-date and relevant electronic databases, thereby improving the range and accessibility of health information resources.

5. **Strengthening Technical Support to Enhance User Accessibility**

   Qualified ICT and library support staff should be provided to assist users in resolving access-related challenges and ensure smooth navigation of electronic resources.

6. **Capacity Building to Improve Effective Access and Use**

   Regular training programmes should be organized to equip users with the necessary skills for effective access and utilization of electronic health information resources.

7. **Improvement of Access Policies to Enhance Usability**

   The library management should review restrictive access policies to make electronic health information resources more easily accessible to users.

Contribution to Knowledge

- This study contributes to existing knowledge by providing empirical evidence on the relationship between availability and accessibility of electronic health information resources in a Nigerian medical library context, specifically the medical library of Nnamdi Azikiwe Teaching Hospital. While previous studies have largely focused on the availability and utilization of electronic resources in academic libraries, this study highlights a critical gap between the existence of electronic health information resources (such as e-journals, online medical databases, and e-books) and the actual accessibility of these resources by users.
- The study further extends knowledge by identifying access-related constraints as the major limiting factor to effective use of electronic health information resources. These constraints include poor internet connectivity, inadequate ICT infrastructure, erratic power supply, limited database subscriptions, and weak technical support systems. By systematically categorizing these challenges, the study provides a clearer understanding of the multidimensional nature of accessibility problems in medical libraries within developing country contexts.
- In addition, the study offers context-specific evidence from a teaching hospital environment, thereby enriching literature on electronic health information access in healthcare settings rather than general academic libraries. This is particularly important because access to timely and reliable medical information directly influences clinical decision-making, research output, and healthcare delivery.

Abstract

Institutional repositories have become central to the management, preservation, and dissemination of scholarly outputs in universities, serving as key instruments for promoting open access and enhancing research visibility. Despite increased adoption of institutional repositories in Nigerian federal universities, the visibility of digital resources hosted on these platforms remains suboptimal, limiting their discoverability and impact within global scholarly communication. This study investigates the challenges encountered in enhancing the visibility of digital resources in institutional repositories used in federal university libraries in North-Central Nigeria, drawing on the perceptions of librarians who are directly responsible for repository management. The study adopted a quantitative research approach with a survey research design. Six federal universities in the North-Central zone of Nigeria with functional institutional repositories were purposively selected. Data were collected from 121 librarians within the study area using a structured questionnaire. The data were analysed using descriptive statistical techniques, including mean scores and standard deviations. Findings reveal that multiple interrelated challenges significantly constrain repository visibility in the region. Two key challenges were ranked with high severity which include researcher awareness and engagement, as well as insufficient internet infrastructure. The results suggest that these challenges are systemic, cutting across human and institutional dimensions, and these collectively undermine the effectiveness of institutional repositories in enhancing research visibility. The study concludes that improving the visibility of digital resources in federal university repositories requires a coordinated institutional response. This includes strategic policies and mandates which would improve the number of digital resources on repositories and finally put repository management on the front burner with proper infrastructural support and financing from management. Finally, the findings provide empirical evidence to inform policy formulation in universities in North-Central Nigeria.

Keywords: Visibility, Institutional repositories, Challenges, North-Central, Perspectives, Open Access Policy, Digital Discoverability

Introduction

The increasing adoption of digital technologies in higher education has transformed the way scholarly information is created, preserved, and disseminated. One of the most significant outcomes of this transformation is the emergence of institutional repositories. Institutional repositories serve as digital platforms for collecting, managing, preserving, and providing access to the intellectual output of universities (Adeyemo & Jamogha, 2021; Dube 2025). These repositories typically host digital resources such as journal, articles, theses, dissertations, conference papers, cultural depictions in the form of images, technical reports, and other scholarly materials produced by academic staff and students. These repositories facilitate open access to research outputs, by so doing institutional repositories play a vital role in enhancing research visibility, institutional reputation, and global scholarly communication. As higher education increasingly moves operation towards digital knowledge ecosystems, the visibility of scholarly outputs has emerged as a critical indicator of research impact, institutional reputation, and academic participation in global discourse. This study examines the problem of digital resource visibility by analysing librarians' perspectives to identify the factors influencing discoverability within digital repositories.

Visibility of digital resources in institutional repositories refers to the extent to which repository content is easily discoverable, accessible, and retrievable by potential users through search engines, academic databases, and repository directories. According to Majhi et al., (2023) visibility is desired for a number of reasons and one of the best means of boosting visibility of research resources is through open access publications. Open access equals a high visibility because it ensures that digital resources reach a wider audience, attract citations, and contribute meaningfully to knowledge exchange at national and international levels (Wani et al., 2023). For universities, improved repository visibility enhances research impact and supports accountability for public funding of research (Ezema & Eze, 2024; Uba E & Okonkwo A, 2021). In spite of these benefits, achieving optimal visibility of digital resources in institutional repositories remains a challenge for many academic institutions, particularly in countries like Nigeria.

Universities have increasingly adopted institutional repositories as part of efforts to promote open access, preserve indigenous research, and improve the dissemination of their scholarly outputs (Salau et al., 2021). University libraries, as the primary managers of these repositories, are responsible for content acquisition, metadata creation, system maintenance, user education, and advocacy for repository use. However, the visibility of digital resources in many Nigerian institutional repositories remains relatively low, as reflected in limited content volume, poor discoverability, and minimal international presence(Macgregor, 2023; Majhi et al., 2023; Odigie et al., 2024). This situation raises concerns about the effectiveness of repository initiatives in achieving their intended objectives.

This concept of visibility encompasses several interconnected dimensions, including metadata quality (Odigie et al., 2024; Pottier et al., 2024), search engine indexing (Majhi et al., 2023), interoperability compliance (Salau et al., 2020), accessibility infrastructure (Waugh et al., 2015), and user engagement practices (Holter, 2020). Visibility therefore represents not only a technological outcome but also a socio-technical phenomenon shaped by institutional policies, human expertise, and researcher participation.

Statement of Problem

Institutional repositories are established in universities to enhance the visibility, accessibility, and impact of digital resources such as journal articles, theses, and dissertations. Several federal university libraries in North-Central Nigeria have adopted institutional repositories as part of efforts to support open access and improve research visibility and dissemination. This can only be achieved if repositories are fully operational and their contents and features optimised. Some ways usage and discovery for institutional repository are optimised are through search engine optimisation techniques (SEO) and indexing.

However, despite the availability of these repositories, the visibility of digital resources remains low in many institutions, limiting their discoverability, usage, and contribution to global scholarly communication. In federal universities in North-Central Nigeria, institutional repositories are often underutilized, with digital resources receiving limited exposure through search engines and academic platforms. In many Nigerian higher education contexts, challenges affecting visibility significantly limit the digital resources discovery and global reach of repository content, thereby constraining the intended benefits of open access initiatives. This persistent low visibility suggests the existence of constraints that continually affect repository performance.

Although previous studies have examined institutional repository adoption and general challenges in Nigeria. Few studies have specifically focused on identifying the challenges encountered in enhancing the visibility of digital resources in repositories used in federal university libraries, particularly within the North-Central zone. The absence of this empirical, context-specific evidence on these challenges limits informed decision-making and strategic intervention in the area. Therefore, there is a need for a systematic study that identifies the challenges to visibility of digital resources in institutional repositories from the perspectives of librarians in federal university libraries in North-Central Nigeria.

Objective of the study

This study highlights the challenges to visibility of digital resources in repositories of North-Central federal university libraries in Nigeria. Specifically, it:

1. identifies the challenges encountered in enhancing the visibility of digital resources in repositories used in federal university libraries in North-Central, Nigeria

Literature Review

The proliferation of institutional repositories (IRs) as infrastructure for open scholarly communication has generated substantial research examining the determinants of faculty and student engagement. Waugh et al. (2015) reveal that repository utilization is fundamentally constrained by unequal awareness across academic ranks, with graduate students demonstrating significantly higher engagement rates than faculty members. This disparity suggests that repositories have evolved into essential infrastructure for emerging scholars' publishing workflows while remaining peripheral to established faculty research practices.

However, awareness alone proves insufficient for sustainable engagement. Yang & Li (2015) demonstrate that tenured faculty, despite heightened repository utilization for publishing purposes, resist mandated deposit policies due to perceived quality degradation in open access venues. This tension between voluntary adoption and policy compliance emerges as a central contradiction in repository use, where increased institutional pressure correlates with submission volume but inversely affects perceived value. Holter, (2020) corroborates this finding through an analysis of the UK's Research Excellence Framework (REF) mandate, revealing how compliance driven policies without commensurate resource allocation generate administrative burden rather than scholarly value.

The barriers to meaningful repository integration extend beyond individual awareness to encompass structural misalignments between institutional infrastructure and academic labour practices. At small teaching focused institutions, faculty resistance stems from repositories' failure to align with established workflows, compounded by copyright anxieties of authors and insufficient incentivization mechanisms (Wu, 2015). Similarly, Holter (2020) identifies missed opportunities to align researcher and institutional goals. Both studies underscore a fundamental issue which is repositories are frequently designed around administrative imperatives rather than functionality, resulting in what Holter (2020) terms "empty compliance" increased deposits devoid of engagement with open access principles.

Moreover, the transition from repository availability to meaningful scholarly communication requires specific infrastructural and instituted cultural mediators. While Waugh et al. (2015) establish that awareness predicts multiple use and contribution behavior, they do not examine the institutional conditions that foster such awareness. Wu (2015) addresses this gap partially through a case study of Roger Williams University, identifying practical strategies to enhance IR relevance in teaching contexts; however, the scope remains constrained to a single institution, limiting generalizability. On the other hand, Yang and Li (2015) employ broader survey methodology but focus exclusively on

faculty attitudes toward open access, neglecting the librarian and repository manager perspectives that Holter (2020) identifies as crucial for understanding systemic implementation challenges.

From another perspective, The REF mandate in the UK has generated distinct compliance cultures compared to the voluntary adoption models prevalent in North American institutions. This divergence suggests that national research evaluation frameworks function as powerful moderators of repository effectiveness. In the Nigerian context, Ezema & Eze, (2024) reveal important infrastructural deficits that compound these challenges: only 26% of universities in South-East Nigeria have fully implemented IRs, with the majority lacking adequate ICT infrastructure and skilled personnel despite employing DSpace as the predominant software solution. The findings establish a direct correlation between functional repository implementation and institutional ranking, underscoring that visibility deficits in resource constrained environments are not merely academic concerns but have tangible consequences for institutional prestige and global positioning.

Furthermore, Uba & Okonkwo (2021) illuminate how the management of local content resources in Nigerian tertiary institutions reflects systemic governance challenges that parallel the "empty compliance" phenomenon identified by Holter (2020). Their investigation of South-East Nigerian institutions reveals that repositories are frequently managed by ICT professionals with dual librarian roles, suggesting hybrid staffing models that may lack specialized expertise in scholarly communication. The documented challenges including inadequate funding, absence of statutory deposit policy, author resistance to content donation, and proliferation of plagiarized materials demonstrate that the barriers Holter (2020) observes in the UK context (administrative burden without resource allocation) manifest differently but no less prominently in developing economies. Notably, Uba and Okonkwo (2021) identify a critical gap in content acquisition strategies: while institutions possess substantial local scholarly outputs (PhD theses, inaugural lectures, institutional publications), these resources remain under deposited due to the absence of enforcement mechanisms and sensitization programs that Wu (2015) identifies as essential for faculty engagement.

The empirical evidence above suggests that repository visibility enhances research dissemination and institutional prestige; however, there are challenges, such as low faculty engagement, infrastructural deficits, and institutional gaps, which if not managed strategically could constitute challenges to visibility. While previous studies in Europe and North America have laid a foundation for exploring these dynamics in research intensive contexts, the Nigerian literature reveals that resource constraints and institutional ranking imperatives introduce distinct modalities of repository dysfunction.

Methodology

The research adopted a quantitative research methodology with a survey research design. The study population comprised eight (8) Federal Universities in the North-Central region of Nigeria. A purposive sample with a single criterion was chosen for this study because purposive sampling allowed the researcher to deliberately target specific respondents who directly encounter the day-to-day challenges affecting the visibility of digital resources (Creswell, 2022). The purposive strategy streamlined the universities to six (6) universities, the only criterion for being selected in this study was that each university in the study area must have a functional repository. From the six (6) universities which met the study criteria we have 121 librarians based on data obtained from each university library. Table 1 shows the selected federal universities based on the criteria and their respondent data. Data were obtained using a structured questionnaire of five strategic options aimed at answering the research objective, 82 questionnaires were duly filled and returned. The results from the questionnaire were analysed using statistical analysis tool and shown in a table 2. A weighted mean was used as a comparative benchmark to rank the severity of the identified challenges. Data Interpretation of respondents' agreement was guided by the mean of the four-point Likert scale (2.50). Mean scores equal to or above 2.50 indicate respondents' agreement that the highlighted factor constitutes a challenge, while scores below 2.50 indicate disagreement. Furthermore, a weighted mean comparison with the overall weighted mean (3.17) allowed for the identification of the perceived severity of these challenges (León-Mantero et al. 2020).

Table 1: Distribution of Universities in North-Central Nigeria

s/no	University Name	State		Repository URL
1	Federal University Lafia	Nasarawa	12	https://rep.fulafia.edu.ng:8080/jspui
2	Federal University Lokoja	Kogi	11	https://repository.fulokoja.edu.ng
3	Federal University of Technology Minna	Niger	26	https://repository.futminna.edu.ng
4	University of Abuja	FCT	11	https://repository.uniabuja.edu.ng
5	University of Jos	Plateau	31	https://dspace.unijos.edu.ng
6	University of Ilorin	Kwara	30	https://uilspace.unilorin.edu.ng
	Total		121	

Analysis

Table 2: The Challenges Encountered in Enhancing the Visibility of Digital Resources in Repositories Used in Federal University Libraries in North-Central, Nigeria

S/N	Challenges	Strongly Agree		Agree		Disagree		Strongly Disagree		N	x	SD	Decision
		F	%	F	%	F	%	F	%				
1	Limited awareness and engagement from researchers	34	41.5	43	52.4	3	3.7	2	2.4	82	3.33	.968	High
2	Unstable internet connectivity	33	40.2	41	50.0	4	4.9	4	4.9	82	3.26	.767	High
3	Limited number of skilled personnel	28	34.1	42	51.2	7	8.5	5	6.1	82	3.13	.813	Low
4	Inadequate infrastructure	30	36.6	38	46.3	5	6.1	9	11.0	82	3.09	.932	Low
5	Attitude of University Management	28	34.1	38	46.3	8	9.8	8	9.8	82	3.05	.915	Low
	Weighted Mean									**82**	**3.17**	**0.819**	

Key: X= Mean SD= Standard Deviation. Decision benchmark: 15.86/5 =3.17

Table 2 reveals the challenges encountered in North-Central Federal university repositories. The table showed two (2) listed factors with mean scores which were above the decision benchmark of 3.17. These include Item 1: Limited awareness and engagement from researchers (x=3.33; SD =.968), Item 2: Unstable internet connectivity (x= 3.26 SD= .767). Furthermore, the data from the table revealed that Item 3: Limited number of skilled personnel (x=3.13 SD=.813), Item 4: Inadequate infrastructure (x=3.09; SD =.932) and Item 5: Attitude of University Management (x=3.05; SD = .915) were low as they both were below the decision rule.

All points within the table indicate challenges as they are above the criterion mean for the Likert scale of 2.5, however the weighted mean of 3.17 was used to highlight severity of challenges within North-Central University. These high points from the table, points to issues that need to be addressed if visibility in federal university libraries in North-Central Nigeria is to improve.

Discussion

The data in table 2 revealed that the challenges encountered in enhancing visibility of digital resources in federal university libraries in North-Central Nigeria are strongly felt in two major areas across all examined fields. The obstacles ranging from human to infrastructural domains suggests that the impediments are systemic rather than isolated and therefore are unlikely to be solved by single solutions. The findings indicated that awareness and researcher engagement as a key barrier to the visibility of digital resources within repositories in North-Central Nigeria. This constraint reduces the availability of digital resources on repositories as librarians are in a constant flux between improving researcher engagement and quality control (such as metadata auditing and implementing interoperability features like OAI and SEO practices). This implies that time which should have been expended on technical issues necessary for visibility is rather wasted on researcher engagement. The finding is in line with Yang & Li, (2015) and Wu (2015) who demonstrated that tenured faculty, resist repositories due to copyright anxieties and perceived quality degradation in open access repositories. In practice, this identified problem linked to researcher awareness and engagement causes a domino effect because without deposits even the best repositories would have zero visibility of their resources.

Secondly the unstable internet connectivity links to infrastructural issues which have continually plagued Nigerian universities. This has led to many repositories being deindexed on search engines. The problem of unstable internet connectivity is particularly harmful for repositories which are on-premise as it hampers domain stability for repositories which affects the credibility of the repositories on search engines. Also, the problem obstructs the ingest process for available digital resources leading to backlogs in upload and auditing of digital resources. The implication of this finding is dual faced, when repositories are intermittently inaccessible, search engines may reduce indexing frequency, thereby lowering the visibility of hosted resources within global discovery systems. Also, unstable internet means upload jobs on repositories get pended which lowers their visibility. The finding correlates to that of Ezema & Eze (2024) who also identified ICT infrastructural issues as a challenge to repositories in South-east Nigeria.

Furthermore, the lack of skilled personnel buttresses a human-technical challenge which hinders not only the ability of the repository software to function properly but also causes other organisational constraints like the inability to keep Service Level Agreement (SLA). Which include reducing downtime for the repository, updating users and especially top management on the need for certain policies and technical upgrades. Which would improve the visibility of the institutional repository. The cumulative impact is diminished discoverability and reduced alignment with open science expectations.

The attitude of university management emerges as another pivotal contextual factor hindering visibility of repositories in the region understudied. Where leadership prioritizes repositories, institutions are more likely to invest in infrastructure, staff development, and policy enforcement. Conversely, an indifferent support results in underfunded systems, indifferent practices, and limited strategic alignment conditions that perpetuate inconsistency and hinder interoperability. These findings are in consonance with Holter (2020) who studied the complexities surrounding digital repositories and found that a lack of resources and support were a major issue further necessitating the need for effective systems to manage and promote institutional repository use.

Addressing these challenges requires a coordinated response, such as creating policies which mandate the upload of institutional research work to repositories by scholars, this creates room for librarians to carry out more advanced tasks of ensuring proper audit for submitted scholarly work improving descriptive metadata necessary for visibility before these works are allowed to be seen by the public. Also, such policies push repositories to the front burner of university management where they are compelled to ensure their repositories remain online and assign units for maintenance and proper fundings. In summary, the consistency of repository in the region will depend on aligning people, processes, and platforms under a visible and supported institutional strategy.

Conclusion

This study examined the challenges affecting the visibility of digital resources in institutional repositories within federal universities in North-Central Nigeria from librarians' perspectives. Findings indicate that repository visibility constraints are multidimensional, involving limited researcher engagement and infrastructural limitations. These factors collectively reduce visibility and restrict the contribution of institutional repositories to global scholarly communication. The results suggest that visibility challenges are not solely technological but emerge from the interaction between institutional support systems, user participation, and operational capacity within the universities. Although repositories exist across the studied institutions, their potential to enhance research dissemination remains underutilized due to systemic operational constraints. The study highlights the central role of librarians as mediators between technology and scholarly communities. Addressing visibility challenges therefore requires coordinated institutional commitment that strengthens infrastructure reliability, improves researcher awareness, and supports sustainable repository management practices capable of enhancing access, discovery and long-term scholarly impact.

Recommendation

The follow recommendations are made:

1. The study recommends that universities libraries strengthen researcher engagement through targeted programmes which would orient researchers on the need to provide their scholarly work for ingest in repositories and ease any fears they might have.
2. Also, university management should endeavour to provide necessary infrastructure needed for work on repositories to move smoothly.

Abstract

The application of artificial intelligence (AI) in library services provides an opportunity to improve the access to and delivery of library services in rural communities that have historically been underserved. However, the use of AI-based information services will still rely on the prevailing level of trust in the application of the services. This study examined the connection between community engagement and trust in AI-based information services in rural libraries in Ebonyi State, Nigeria. The study employed the explanatory sequential mixed-method design, integrating both the qualitative and quantitative approaches. The quantitative aspect involved structured questionnaires administered to 310 rural library users, while the qualitative aspect comprised interviews and focus group discussions with library users and community leaders. Quantitative data were analyzed descriptively with Pearson correlation and regression analysis, while qualitative data were analyzed thematically. The study findings indicated a positive, significant relationship between community engagement and trust in AI-based information services ($r = .682$, $p < .05$). The trust in AI services also showed a strong positive relationship with the perceived effectiveness of the services ($r = .741$, $p < .05$) and explained 54.9% of the variance in trust. The primary determinants of trust in AI services were the human oversight of the service, verification of the information, service transparency, and the protection of user data. The primary barriers to the application of AI-based services identified in the study were poor internet access and irregular (low) supply of electricity, low digital literacy, privacy concerns, and inadequate funding. The qualitative findings stressed the significance of community participation, awareness initiatives, and transparent communication for building trust. This paper concludes that proper implementation of AI in rural libraries depends on stability of technology; community participation, institutional support, ethics and responsible governance.

Keywords: Artificial Intelligence, community engagement, trust, rural libraries, information services, digital inclusion, Nigeria.

Background of the Study:

The aim of this study is to analyze community engagement and trust in AI-based information services in rural libraries in Ebonyi state Nigeria. The speed with which the development of Artificial Intelligence (AI) technologies has impacted the delivery of information services in various sectors is remarkable. Libraries, along with other sectors, have been affected. The major challenge is that, while considerable effort has been made to integrate AI in other parts of the world, rural communities in developing countries, especially Nigeria, remain under supported (Van Dijk 2020); Owolabi et al. 2021). The focus of the research is the perception and trust of rural communities in the AI-based information services in rural libraries of Nigeria, especially the Ebonyi state which is relatively low in digital technology infrastructure as well as trust and confidence in the innovations. This study is valuable because it has the capacity to stimulate policy and practice and responds to the need for a purposeful and constructive digital transformation in rural communities that enhances access to rural information services and subsequently rural community development (Ogunleye et al., 2021). Furthermore, the use of AI services demonstrates that service user confidence is the greatest influence on the acceptance of AI services (Glikson & Woolley, 2020) and is not limited to the adoption of technology but has social and commercial value.

The prominence of community engagement and trust in AI-based services for rural technologies lies in the success AI-based services can achieve in rural areas. Engagement leads to community acceptance, and trust in the AI system encourages the community to adopt and use AI-based services (Glikson & Woolley, 2020). As described in the Technology Acceptance Model (TAM), trust is an important factor in acceptance, while the perceived benefits and simplicity of the system shape a user's attitude toward a technology (Davis, 1989). Correspondingly, Social Capital Theory describes the role of networks and social relations of a community in building trust and collaboration, and is

really evident in rural areas (Putnam, 2000). This research seeks the opportunity to determine the relationship and the degree of influence community engagement and trust exert upon one another in rural libraries in Ebonyi State.

The body of work that exists pertaining to AI-based information services in libraries is extensive in that it describes similar relationships across different areas, especially in developed countries. However, there is scant research on rural libraries in developing countries, such as Nigeria. While recent studies in Europe and the USA have shown trust in AI to be significant (Shin, 2021; Albrecht & Ojala, 2021), the rural African context and its libraries have been largely unexplored. There is growing literature on AI-based services and the trust element in information services (Choung, David, & Ross 2023), and more studies examining community engagement and trust in the context of rural library services are needed. Although many studies on AI adoption exist, there are gaps in understanding trust and engagement in rural Africa. There are some contextualized studies, but most do not incorporate the socioeconomic and cultural barriers and infrastructure as seen in rural Nigeria. This study will focus on Ebonyi State and draw on the intersections of sociology and technology to offer insights on the potential of rural library based AI information services and the role of community engagement in building trust.

Rural libraries in Nigeria lack some factors needed in accepting AI based services due to deficits in infrastructure and lack of digital literacy skills (Adeleke et al., 2022). Limited information has been found about the issues in rural library system in Nigeria, but it remains relatively unexplored on AI based services. In order to find solutions this gap will be investigated by studying how community engagement can be used to bridge the lack of AI based trust. This study addresses the limitations in developing nations in digital revolution by highlighting some challenges and possible solutions, for policymaker to make better intervention plan in Nigeria context in comparative lens.

Lack of access to AI based information services in rural libraries in Ebonyi state Nigeria remains a great issue. Although AI services has been widely used in libraries worldwide the rural Nigerian society particularly in Ebonyi State have the problem of accessing this service due to lack of digital literacy, infrastructures and general distrust in AI technology (Adeleke et al., 2022); Owolabi et al. 2021). These drawbacks deny rural community some of the benefits of AI based services in expanding information access and boosting socio economic status of the inhabitants. A major challenge that causes lack of interest and low adoption of AI based services is lack of trust in such service which can be overcome through engagement with users (Glikson & Woolley, 2020). This problem makes the community vulnerable to the digital divide, thus denies them the gains it promised to provide.

Various policy initiatives have been made to address this problem, but without success as Nigerian policy makers fail to integrate specific socio-cultural characteristics of rural communities into their digital literacy programs (Ogunleye et al., 2021). These programs have failed to address these specific features of the rural community, with some programs failing to adopt the use of AI based information services within the context of libraries and communities. There is no specific policy that has adequately addressed the issue of overcoming user distrust in the context of AI based information service in the rural library setting. While it has been accepted globally that the adoption of AI in libraries is progressing, very little attention is paid to how community engagement can address user distrust on AI based information services in rural libraries in Nigeria. Unlike existing literature, there has been no attempt at studying user trust in AI based information services in the rural library context of Ebonyi State and the study by Shin (2021) and Choung, David & Ross (2023) does not look into how this two concepts correlate within the rural library setting in Nigeria. This study seeks to examine the impact of community engagement on the trust levels associated with the adoption of AI based information services in rural libraries in Ebonyi State, and hence address the deficit in research literature.

Research Objectives:

1. To assess the impact of community engagement in AI-based information services on trust levels within rural libraries in Ebonyi State, Nigeria, using descriptive statistics.
2. To identify the key factors contributing to trust in AI-based services within rural communities, particularly in Ebonyi State, with a focus on socio-cultural and technological influences.
3. To evaluate the relationship between the perceived effectiveness of AI-based information services and the degree of trust by rural library users in Ebonyi State.
4. To explore the barriers to community engagement and trust in AI-based information services within rural libraries, with a focus on Ebonyi State's unique socio-economic challenges.
5. To propose actionable recommendations for improving community engagement and trust in AI-based information services for rural libraries in Ebonyi State, grounded in descriptive statistical analysis.

Research Questions:

1. What is the impact of community engagement in AI-based information services on the trust levels of users in rural libraries in Ebonyi State, Nigeria?
2. What are the key factors that contribute to trust in AI-based information services within rural communities in Ebonyi State, particularly regarding socio-cultural and technological influences?
3. What relationship exists between the perceived effectiveness of AI-based information services and the degree of trust among rural library users in Ebonyi State?

4. What barriers hinder community engagement and trust in AI-based information services within rural libraries in Ebonyi State, considering the state's unique socio-economic challenges?
5. What strategies and recommendations can be proposed to enhance community engagement and trust in AI-based information services in rural libraries in Ebonyi State?

Literature Review

Conceptual Review

Community engagement: Individuals, groups and society interact in processes of decision, action and policies that directly affect their life. This type of engagement focuses on building trusting, cooperative and relational contexts within communities. This term originated from literature in community development and public administration and the early uses can be seen in literature by practitioner's like Robert Putnam (2000) who discusses the relationship of social capital in communities. There are various terms describing ways that communities can become involved in their library and technology, this could be described in various ways, but it fits with participation and collaboration in technology design and use, such as in the community development literature, participatory decision making, and collaborative planning (Putnam, 2000). In terms of rural libraries community engagement is about building trust and facilitating active participation.

Trust in relation to AI services, can be explained as "willingness to accept vulnerability based on positive expectations of another's behavior." This type of relationship is applicable in the case of technology and institutions implementing it, trust in technology must be established before a system can be accepted and used, trust in AI services particularly, are closely linked to concerns surrounding data privacy, algorithmic bias, and transparency (Mayer, Davis, & Schoorman, 1995). With the development of new technology, the definition of trust in automated systems continues to evolve, now including the perceived ability of systems to operate effectively without human intervention, AI-based services have raised issues surrounding its use that have become inextricably linked with how we conceptualize trust. Trust in AI services can encompass many issues including the user's perception of its reliability and the degree to which a user trusts the artificial intelligence service's capabilities. The lack of experience users may have with advanced technologies can intensify trust issues with the new systems.

AI based information services: are a type of digital service which make use of artificial intelligence to improve access and delivery of information. These services could make a difference in libraries offering personalized service, improved search functionalities, automating of tasks, and access to information on the Internet. Rural library services are only beginning to experience the use of AI in services, with obstacles of low levels of technology literacy and infrastructure, as well as trust in automated services (Choung, David, & Ross 2023). AI based information services have an important role to play in providing greater access to information for isolated and under-served rural communities thereby strengthening their services. Trust in AI based information services is inseparable from community engagement. The engagement process will likely contribute to overcoming the barriers for use and trust among local users. As trust in technology is considered to be a social and psychological phenomenon, which grows through interactions, engagement processes must ensure both the social and technical aspects are considered as a whole system approach to design and use.

Measure of engagement and trust: Engagement and trust are often measured using methods like surveys, interviews, and observations. For community engagement and rural library users these will vary, with engagement often relating to the degree to which users participate in library programs, trust can be measured by the degree of reliance and perceived accuracy of the information delivered by the AI based services (Glikson and Woolley 2020).

Theoretical Review

The Technology Acceptance Model (TAM) is a prominent framework used to analyze new technology adoption. With respect to the adoption of AI-based information services by rural libraries, perceived ease of use and perceived usefulness can be applied to predict adoption (Davis, 1989). Applied in the context of rural libraries, the model holds that if rural community members believe that AI-based information services are useful and easy to use, they will develop more trust toward these services, thus enabling technology adoption. In the case of Nigeria, TAM can aid the development of an appropriate AI system that caters to the perceived need and capabilities of the rural user (Adeleke et al., 2022). The ability to increase the use of these services can be amplified through user-friendly interface design and the demonstration of the service's utility and practical benefits, building trust toward these systems.

Social Capital Theory suggests that "the strength of the relations and ties among members of a community is what is believed to play a vital role in fostering collaboration and trust among community members" (Putnam, 2000, p. 1). Thus, the Social Capital Theory can be used to predict how the use of AI-based information services by rural communities in Nigeria, a country with close-knit social networks, is mediated by trust derived from community trust networks and increased engagement, which will in turn lead to widespread adoption. This approach emphasizes that collective action through social trust and norms can effectively overcome barriers to innovation. Given the importance of social networks and trusts in facilitating information dissemination and innovation adoption among rural Nigerian populations, community engagement should leverage this social infrastructure to build trust in novel information services (Ogunleye et al., 2021).

Diffusion of Innovations theory by Everett Rogers (2003) defines and describes the factors influencing the adoption of innovations, such as AI-based information services. According to the Diffusion of Innovations theory, the successful adoption of new ideas is contingent on the innovation's perceived relative advantage over existing solutions, its compatibility with existing values, and the persuasive influence of opinion leaders within the community. Diffusion of AI technologies may be slower in Nigeria's rural areas due to a lack of familiarity and deep-rooted adoption of traditional methods of accessing information unless specific and community-oriented strategies are implemented (Choung, David, & Ross 2023).

Empirical Review

Studies have examined the interplay between community engagement, trust and adoption of AI-based information services, with diverse contexts and research focus. In line with the hypothesis, research on the digital divide in rural Nigeria has indicated that although most of the participants experienced limitations to their access, especially concerning their trust in new technologies as a result of being less familiar, community-based intervention could boost its use over time (Van Dijk, 2020). His approach involving surveys and community focus groups proved that trust is enhanced over time with active community participation, which further supports its relevance to the study's problem which aligns with Adelek et al., (2022) observations that it is the community involvement that can accelerate its adoption in Nigeria.

An alternative study aimed at determining factors that contribute to trust and acceptance of AI systems and that examined explainability, transparency and user perceptions of AI technologies and used quantitative and qualitative method. The study found that users tend to have higher trust in AI systems with explainable, transparent and intelligible processes, while data privacy concerns, algorithmic bias and accountability reduce it (Shin, 2021). These factors are relevant in assessing how these concerns influence AI based information services adoption in rural areas of Ebonyi State.

Another study focused on citizen participation and trust in AI-enabled public services to determine how participation strategies influenced public trust in AI systems. The findings indicated that interventions involving citizens and stakeholders in the design, implementation, and evaluation phases of AI service delivery enhance trust, acceptance, and satisfaction more than other intervention models (Fischer et al., 2023). Employing both quantitative and qualitative approaches through a survey method and focus group discussions of stakeholders in the service, their conclusion further reiterates the position of Owolabi et al., (2021) that in libraries in Nigeria, a majority of these factors such as perceived benefits, community opinions towards AI and opinion leader's opinion highly impact adoption.

Methodology

Research Design

This study utilized a mixed-method case study design employing an explanatory sequential approach. The rationale for selecting this design was to gain a deeper insight into the interplay between community engagement and trust in AI-based information services in rural libraries within Ebonyi State. The quantitative component (first phase) was addressed by administering a structured questionnaire to collect data on the participants' level of trust, degree of engagement, and views about the effectiveness of AI-based information services. The second phase involved data collection using qualitative methods such as interviews and focus group discussions in order to reveal underlying socio-cultural factors and conditions affecting user trust and engagement. Both quantitative and qualitative data were used for a thorough understanding of the phenomenon in the context of this study.

Population and Sampling Procedure

The population of the study was drawn from users of rural libraries in Ebonyi State as well as the librarians and community leaders involved with the selected libraries. The selected rural libraries were the sample frame of the study and were situated in different parts of the State. Multi-stage sampling technique was employed to derive a representative sample of the population for this study. In the first stage, a purposive selection of rural libraries that have already adopted AI based information services was made since they are most relevant to the objectives of this study. In the second stage, library users were stratified based on their demographic characteristics which included age, gender, and frequency of usage. This was necessary because a variety of perspectives would exist concerning these issues. In the final stage of sampling, respondents were randomly selected from the strata of users to ensure representativeness of all segments of the sample and eliminate sampling bias.

A sample size of 350 users for quantitative study, while for the qualitative study, 20 librarians and 30 community leaders were purposively selected due to their insight on library operations and information needs of the community members. The participants were drawn via library notices, posters and personally invited by the librarians to join in the research process. All participants have given informed consent to participate in the study. Of the 350 questionnares distributed, 310 were properly completed and returned, thus yielding a response rate of 84 percent. The response rate achieved for this study can be considered adequate and sufficient for a social science based research, especially when involving a community study.

Instrumentation

Three primary research instruments were employed for the data collection in the study: the structured questionnaire, a focus group discussion and a semi-structured interview guide.

The instrument design was based on relevant literature on artificial intelligence trust, community engagement, rural library information services and related constructs. The structured questionnaire was made up of items on a 4-point likert scale from Strongly Disagree to Strongly Agree. This instrument was broken down into several sections including: respondent's demographic characteristics; community engagement characteristics; perceived effectiveness of AI based information services; trust in AI based information services; barriers to the use and adoption of AI technology.

Before deployment, the questionnaire was validated by three measurement experts in Library and Information Science and measurement & Evaluation Unit of Department of Science Education, University of Nigeria Nigeria. The responses of these experts guided the researcher in modifying and amending the questions where necessary. A pilot study was subsequently carried out on 30 subjects using a pilot version of the questionnaire so as to measure the comprehensibility, applicability and validity of the questions. The feedbacks received in the pilot study led to further refinement of the questionnaires used for the actual research study.

The validation was ascertained using an expert opinion while the reliability was computed using Cronbach's Alpha and the Cronbach's Alpha scores for each scales exceeded 0.70 threshold. A semi-structured interview guide was used to complement the quantitative aspect. The questionnaire had open-ended items intended to probe socio-cultural, contextual issues and user's opinions and feelings about the AI based information services, thus allowing the participants to provide additional useful information and give examples where possible.

Data Collection Procedure: Data collection was conducted in two distinct phases consistent with the explanatory sequential mixed-method design. The quantitative phase involved the administration of questionnaires to library users in their respective libraries within rural communities in Ebonyi State. The questionnaires were distributed and collected personally by well-trained research assistants who also clarified respondents' concerns and helped those who may experience difficulty reading. Help was provided where necessary to ensure the respondent correctly answered the question without bias from the researcher.

Following the quantitative part, the interviews with the librarians and focus group discussion with the community leaders were conducted to investigate deeper into the issues identified in the quantitative phase. The research used the local languages to enhance proper understanding and effective response among the participants and both the interview and focus group discussion sessions were audio recorded and later transcribed.

Data Analysis

The data collected were analyzed using descriptive and inferential statistics. The descriptive statistical measures used were; frequency count, percentages, mean and standard deviation, which were employed to describe the sample characteristics, respondents' trust in and usage of AI based information services, and perceived effectiveness of the AI based information services in rural libraries. Pearson Product Moment Correlation and Regression Analysis were used to establish the existence and nature of a relationship between the study variables and the predicting power of the perceived effectiveness of the information services on trust. The means were interpreted using previously established decision levels so as to make more meaningful interpretations of the responses.

For the qualitative data, the analysis method used was the thematic analysis approach, where the key themes were identified, coded and interpreted on the basis of social, technological, cultural and other institutional factors affecting the participants' trust and engagement in using the AI based information services in their local libraries. The thematic analysis was facilitated using the NVivo qualitative analysis software to code and group common themes which helped in its efficient organization. Methodological complementarity was achieved by triangulating the quantitative and qualitative data sources to produce findings which validate each other.

Ethical Considerations

Strict ethical procedures were observed throughout the study. Before the commencement of the research work, permission was obtained from appropriate institution for ethical review of the study. Also, participation in the research was entirely on voluntary basis, and the respondents were fully informed about the purpose of the study, their rights and the confidential nature of their contribution to the research. Informed consent was obtained from all the participants before their involvement. Measures to guarantee both anonymity and confidentiality were put in place to protect the participants' right to privacy.

Results

Analysis of Respondents' Demographic Profile

The profiles of the respondents who participated in this study are detailed in this section. Three hundred and fifty questionnaires were distributed among rural library users in selected libraries within Ebonyi State, out of which 310 were properly completed and retrieved (310/350= 88.6 %). As suggested by Creswell and Creswell (2018), an above 80% response rate is desirable when considering whether representativeness of the sample has been achieved or not to reduce non-response bias in surveys.

Table 1. Demographic Characteristics of Respondents (N = 310)

Variable	Category	Frequency	Percentage (%)
Gender	Male	168	54.2
	Female	142	45.8
	Total	310	100.0
Age	18–25 years	86	27.7
	26–35 years	98	31.6
	36–45 years	65	21.0
	46–55 years	38	12.3
	Above 55 years	23	7.4
	Total	310	100.0
Educational Qualification	Primary Education	32	10.3
	Secondary Education	89	28.7
	Diploma/NCE	72	23.2
	Bachelor's Degree	91	29.4
	Postgraduate Degree	26	8.4
	Total	310	100.0
Occupation	Student	94	30.3
	Farmer	48	15.5
	Trader	71	22.9
	Civil Servant	54	17.4
	Self-employed/Others	43	13.9
	Total	310	100.0
Frequency of Library Use	Daily	62	20.0
	Weekly	118	38.1
	Monthly	79	25.5
	Occasionally	51	16.4
	Total	310	100.0
Experience with AI Services	Less than 6 months	75	24.2
	6 months–1 year	102	32.9
	2–3 years	88	28.4
	Above 3 years	45	14.5
	Total	310	100.0

Discussion of Demographic Findings

The demographic analysis revealed that men constituted a slightly higher percentage (54.2) compared to women (45.8).This could reflect the slightly increased accessibility to digital technologies for rural women, compared to earlier reports of the disparity (van Deursen & van Dijk, 2019; Scheerder, van Deursen, & van Dijk, 2021). Recent trends show that gender-disparities in technology utilization are narrowing due to expanding digital inclusions in developing contexts (Van Deursen & Van Dijk, 2019). Respondents aged between 18 and 35 made up the largest chunk (59.3).This means that AI-based information service in rural libraries is being accessed most by the younger demographics who typically have higher digital literacies and greater access to and exposure to new technologies (Venkatesh et al., 2022; Dwivedi et al., 2023).

The educational profile indicates that most of the respondents had at least secondary education (89.7); and 37.8% had tertiary education. Education is often cited as being crucial for determining digital competence, trust in technology, and confidence in AI (Ameen et al., 2021). Individuals with a high level of education understand what an AI service is, the benefits it offers and is more receptive to using technology than individuals who are not. This finding indicates that majority of the respondents were suitable candidates for trusting AI-based information services in rural libraries as 89.7% had tertiary education or above.

Occupational distribution showed students (30.3 %) forming the largest group followed by traders (22.9 %) and civil servants (17.4 %).This shows how relevant AI-based information services has become for students, and also for rural economies in business and public administration. This shows that rural libraries have indeed become a source of vital information to diverse groups.

38.1 % of respondents visited the library weekly thus indicating frequent use. Having more experience using a certain system makes individuals gain confidence. Similarly 75.8% had been using AI-based information services for more than six months thus indicating sufficient experience for forming valid opinions. All respondents were representative and therefore adequately positioned for assessing the impact, usability and trust in AI based information service in rural libraries in Ebonyi State.

Analysis of Research Questions

The responses to the five research questions are discussed and presented below. Descriptive statistical tools, Pearson Product-Moment Correlation and regression analysis were used to analyze questionnaire data, whilst qualitative data collected via interviews with librarians and community leaders were analyzed using thematic analysis and supported by NVivo software.

Research Question One: What is the impact of community engagement in AI-based information services on the trust levels of users in rural libraries in Ebonyi State, Nigeria?

The mean scores and standard deviations of respondents' ratings on community engagement were calculated. Based on Nunnally and Bernstein (2019) criterion mean is 2.5. Figures above 2.5 are agreement, figures below 2.5 mean is disagreement.

Table 2 Community Engagement and Trust

Item	Mean	SD	Decision
Community members are consulted before AI implementation.	3.12	0.71	Agree
Users participate in discussions concerning AI services.	3.08	0.76	Agree
Community feedback influences AI decisions.	2.94	0.83	Agree
Awareness programmes are regularly organized.	3.21	0.68	Agree
Community leaders support AI adoption.	3.04	0.79	Agree
Users are encouraged to express concerns.	3.16	0.72	Agree
Training programmes improve AI understanding.	3.29	0.64	Agree
Communication regarding AI innovations is adequate.	2.98	0.82	Agree
Community participation increases confidence in AI.	3.34	0.61	Agree
Community engagement improves acceptance of AI.	3.42	0.59	Agree
Grand Mean	**3.16**	**0.72**	**Agree**

The result shows that there is a high agreement to community engagement aspect of AI-based information services. Higher agreement for “Community engagement influences the acceptance of AI” (M=3.42) followed by “Community participation reinforces confidence to use AI” (M=3.34) and mean for all items is 3.16. This clearly suggests that community engagement is important in determining the level of users' trust in AI based services.

The impact of community engagement on users' trust was analyzed by correlation.

Table 3: Pearson Correlation between Community Engagement and Trust

Variables	Mean	SD	r	p-value
Community Engagement	3.16	0.72		
Trust in AI Services	3.37	0.63	0.682	0.000*

*Significant at $p < .05$

The results indicate a positive and highly significant correlation between community engagement and users' trust (r= .682, p<.05). This shows that, as community engagement in the planning, deployment and use of AI-based information services increases, so does users' trust in such services. The impact is indeed large; that is, it suggests that involving the local people will significantly enhance trust in the service. Trust is often related to perception, and if local people feels they have ownership of the system and they were part of the initial processes, it is more likely for them to trust the system. Qualitative information from librarians and community leader's interview provides support. There were 3 themes from the analysis of interview transcripts with librarians and community leaders.

Theme 1: Participatory decision-making.

Participants believed that when people are brought on board at the initial stages of technology adoption; the usage tends to be high and reliable.

"If the community are properly involved at the initial stages then acceptance level would be higher..." Librarian 7

Theme 2: Increased community ownership

There was a perception that involving community members helped people to feel responsible for the success of the systems.

Theme 3: Reduced level of uncertainty.

The more the system is made transparent through continuous feedback, the more trustworthy it is believed to be.

This study has findings that are in alignment with previous literature showing that community engagement is central to building a trusting society (Jasanoff, 2021; Fischer et al., 2023) and in building trust towards newer systems like artificial intelligence (Dwivedi et al.,2023).

Research Question Two

What are the key factors that contribute to trust in AI-based information services within rural communities in Ebonyi State?

Table 4. Factors Influencing Trust in AI-Based Information Services

Trust Factor	Mean	SD	Rank
Human Oversight	3.61	0.48	1st
Information Verification	3.57	0.52	2nd
Data Privacy Protection	3.54	0.55	3rd
Transparency	3.48	0.61	4th
Librarian Support	3.41	0.59	5th
Digital Literacy	3.35	0.63	6th
Library Reputation	3.37	0.62	7th

The findings reveal that majority of respondents rated human oversight as the leading driver of trust in the system (M=3.61), closely followed by accuracy of information (M=3.57) and privacy protection (M=3.54). The finding indicates that users' trust in the AI-based information system is influenced by librarians that offer technical help and supervision as the output from the AI based information system would have to be fact-checked before utilization; and also users tend to have higher trust if their private data is well protected and if the system is very accurate in its feedback. The findings on this question are supported by 2 themes from the qualitative study:

Socio-Cultural Factors

- Trust in librarians.
- Community endorsement.
- Cultural compatibility.
- Local language accessibility.

Technological Factors

- Accuracy of AI outputs.
- Ease of use.
- Transparency.
- Reliability of systems.

This highlights users' inclination to trust systems that explain how the data is processed and information generated. This finding supports prior studies in indicating that explainability and transparency are significant determinants of AI trust

(Shin, 2021; Choung et al., 2023). Notably, this study confirms the importance of human agency (librarian), which has been identified as a key mediating factor for technology acceptance and trust (Ameen et al., 2021).

Research Question Three

What relationship exists between the perceived effectiveness of AI-based information services and the degree of trust among rural library users?

Table 5: Perceived Effectiveness of AI Services

Item	Mean	SD	Decision
AI provides information quickly.	3.62	0.51	Agree
AI improves information access.	3.54	0.56	Agree
AI reduces search time.	3.59	0.52	Agree
AI improves retrieval accuracy.	3.41	0.63	Agree
AI enhances learning activities.	3.37	0.68	Agree
AI provides useful recommendations.	3.29	0.71	Agree
AI improves user satisfaction.	3.34	0.66	Agree
AI supports decision-making.	3.21	0.74	Agree
AI is more efficient than traditional methods.	3.46	0.61	Agree
AI effectively meets information needs.	3.48	0.58	Agree
Grand Mean	**3.43**	**0.62**	**Agree**

Table 6: Correlation between Perceived Effectiveness and Trust

Variables	Mean	SD	r	p-value
Perceived Effectiveness	3.43	0.62		
Trust	3.37	0.63	.741	.000*

*Significant at $p < .05$

The results indicate that there is a very high and positive correlation between Perceived effectiveness and users' trust ($r=.741$, $p<.05$). The stronger correlation suggests that the perceived usefulness and impact of AI-based services in users' daily tasks enhances their levels of confidence. A further regression was performed to establish the degree to which Perceived Effectiveness explains variations in the level of users' trust.

Table 7: Regression Analysis Predicting Trust from Perceived Effectiveness

Model Summary	Value
R	.741
R^2	.549
Adjusted R^2	.547
F-value	375.43
p-value	.000

The regression analysis showed that perceived effectiveness predicted about 54.9% of the variation in levels of trust. It seems that user trust in AI systems is largely dependent on user's perceived effectiveness.

Common reasons cited by the interview participants for trusting AI services were the speed, the convenience of the services, and easy accessibility, plus efficient information retrieval.

"The AI service helped the users access the information much faster than traditional search methods." (Librarian 12)

The results are in line with the Technology Acceptance Model, where perceived usefulness was one of the key factors of acceptance and trust (Davis, 1989), and previous findings from Venkatesh et al. (2022) and Dwivedi et al. (2023), where system performance showed strong effects on trust and behavioral intention.

Research Question Four

What barriers hinder community engagement and trust in AI-based information services within rural libraries in Ebonyi State?

Table 8: Major Barriers to Community Engagement and Trust

Barrier	Mean	SD	Rank
Irregular Electricity Supply	3.71	0.44	1st
Poor Internet Connectivity	3.66	0.47	2nd
Financial Constraints	3.54	0.51	3rd
Privacy Concerns	3.47	0.57	4th
Lack of Technical Support	3.43	0.58	5th
Low Digital Literacy	3.42	0.59	6th
Lack of Awareness	3.38	0.62	7th

The Table 8 illustrates that infrastructural problems represent the major challenges for trusting and engaging with the services; lack of stable electricity supply and slow internet access were ranked top (M = 3.71 and M = 3.66).

The qualitative analysis provided four major themes for barriers:

Theme 1: Infrastructure Deficiency. Lack of electricity and slow internet services were persistently reported issues by users.

Theme 2: Digital Skills Deficit. Participants often lacked essential digital competencies needed to work with AI based information services.

Theme 3: Privacy and Security Concerns. Users expressed their fears about the usage of their data and information security.

Theme 4: Financial Constraint. A lack of funds to acquire and maintain new technologies was the primary concern for most of the respondents.

These findings correspond with other research on digital inclusion in the developing world where infrastructure and affordability have been cited as key obstacles to technology adoption (Van Deursen & Van Dijk, 2019; Ly Hoa, 2026).

Research Question Five

What strategies can improve community engagement and trust in AI-based information services?

Table 9: Recommended Strategies

Strategy	Mean	Rank
Government Funding Support	3.77	1st
Human Oversight of AI Systems	3.74	2nd
AI Literacy Training	3.72	3rd
Librarian Capacity Building	3.71	4th
Transparency Measures	3.69	5th
Community Sensitization	3.67	6th
Monitoring and Evaluation	3.65	7th

Overall, the data showed high support for initiatives that involved technological, educational, and institutional measures. Government financial support ranked highest in community expectations, while human oversight and AI literacy training showed significant support as well.

The qualitative data analysis validated the quantitative findings; suggestions made by interview participants include continuous community sensitization, AI literacy programs, improved infrastructure, integration of local languages, creation of a community advisory committee and the strengthening of privacy policies.

The congruence between quantitative and qualitative findings supports the idea that the building of trust requires active and collaborative efforts involving the government, librarians, community leaders, technologists and users.

Discussion of Findings

Community Engagement and Trust in AI Services

The study revealed a significant positive correlation between community engagement and trust in AI-based information services (r=.682). These findings align with the tenets of Social Trust Theory that suggests trust is built over time through multiple interactions, communication, and the participation of stakeholders in the development and delivery of a service (Mayer et al. 1995). The current results are also consistent with the findings of Fischer et al. (2023) which revealed thatcitizen participation had an impact on public confidence towards AI-driven public services, and Jasanoff (2021) who argued for the importance of citizen participation to give legitimacy and societal acceptance to emerging technologies.

Factors influencing trust in AI.

The most salient predictors of trust in the research were human supervision, information verification and privacy protection. These findings are indicative of increasing public concern over algorithmic responsibility and ethical AI implementation; respondents showed higher levels of trust when librarians helped to ensure the accuracy and trustworthiness of the information obtained through the AI systems. These results are supported by research of Shin (2021) who showed that explainability and transparency enhanced the user trust in AI services, and Choung et al. (2023) who identified accountability mechanisms as an important component for enhancing public trust in AI technologies.

Perceived Effectiveness and Trust.

There is strong evidence that the users trust AI systems based on performance criteria as supported by the high correlation coefficient between perceived effectiveness and trust (r=.741). Users who reported higher levels of satisfaction regarding the AI services' effectiveness and convenience experienced higher levels of trust in those systems. The current results are also in line with the Technology Acceptance Model (Davis, 1989) and research from Venkatesh et al. (2022), who identified perceived usefulness as the second strongest determinant of technology adoption, and Dwivedi et al. (2023), where the effect of system performance on trust was significant, positively predicting trust and behavioral intention.

Barriers to Community Engagement and Trust

The study identified infrastructure limitations, low digital literacy, data privacy concerns, and financial constraints as the major obstacles to community engagement and trust in AI-based information services. These findings reflect the reality of rural communities in developing countries; lack of electricity and the poor quality of internet connection are persistent challenges to digital inclusion (Van Deursen & Van Dijk, 2019; Hilbert, 2016).

Strategies for Strengthening Trust

Based on the findings, it can be said that government financial support and AI literacy training are essential for community engagement and trust-building as evidenced by the ranking shown in table 9; the significance of transparency and human oversight were also consistently noted. These findings reflect ongoing discourses on responsible AI and ethical guidelines for its use, which call for increased transparency, accountability, inclusiveness, and safety in AI deployment (Floridi et al., 2018). In essence, these findings suggest that an effective deployment of AI in rural libraries necessitates a balance of technological innovation and community-centric implementation strategies.

Conclusion, Implications, Recommendations, Limitations, and Future Research Directions

Conclusion

This study investigated community engagement and trust in AI-based information services within rural libraries in Ebonyi State, Nigeria. A mixed-methods approach was employed to assess the impact of community engagement on trust, the factors influencing trust in AI-based information services, the relationship between perceived effectiveness and trust, barriers to community engagement and trust in AI-based services, and strategies to enhance the adoption and sustainability of AI-based information services in rural library environments.

The study found that community engagement has a significant impact on users' trust in AI-based information services. The strong positive correlation between community engagement and trust indicates that active involvement of users and stakeholders in planning, implementation, and evaluation processes contributes to enhanced user confidence in AI-driven technologies. These findings align with arguments suggesting that trust in technology innovations is social-constructed through participatory processes and collective decision-making mechanisms (Jasanoff, 2021; Fischer et al., 2023).

This study also identified technological, institutional and socio-cultural factors that shape users' trust in AI-based information services. Key dimensions included human oversight, information verification, transparency, data privacy and security, librarian assistance and users' digital literacy. It was found that users were likely to develop a higher level of trust in AI-generated information when services were perceived to be transparent, accountable, and guided by trusted human information professionals. The findings are in agreement with studies which have argued that trust in technology depends on its explainability, accountability and human-centered design (Shin, 2021; Choung et al., 2023).

Further, this study confirmed the positive relationship between perceived effectiveness and trust in AI-based information services. Users who perceived the AI services as useful, reliable, efficient and able to address their information needs demonstrated higher trust levels. These results are consistent with the Technology Acceptance Model (TAM), which posited perceived usefulness as a predictor of technology adoption (Davis, 1989; Venkatesh et al., 2022).

The study also identified various barriers to community engagement and trust in AI-based information services such as lack of digital infrastructure, poor internet connection, erratic electricity supply, users' poor digital skills, privacy and security concerns, limited access to technical support and lack of adequate funding. These factors suggest that the deployment of AI in rural settings are often constrained by structural and contextual factors.

It is concluded that the effective deployment of AI-based information services in rural libraries depends on a holistic integration of the technology with community participation, ethical design and institutional support. Trust in AI, as demonstrated in this study, is built not only upon its technological capabilities but also through the interplay between technology, users, the community and the environment in which the technology is deployed.

Theoretical Implications

The study contributes to the discourse on AI, information behavior, digital inclusion, and trust in novel technologies. Firstly, it has provided an extended empirical evidence base for the Technology Acceptance Model (TAM), by exploring community engagement as a critical context factor influencing the use and adoption of AI technologies. Traditional TAM has focused on perceived usefulness and ease of use as primary drivers of acceptance (Davis, 1989); however, the current study suggests that community participation is also a key antecedent to trust in AI-based systems. Secondly, the study has reaffirmed Social Trust Theory through the demonstration that users' trust in AI-based technologies are influenced through socially trusted intermediary entities such as librarian, community leaders and libraries as institutions (Mayer et al., 1995). The current research finds that in addition to its technical features, the trustworthiness of AI is often dependent on factors such as existing social relationships and credibility of institutions. Thirdly, it has made a contribution to the nascent research on Responsible and Explainable AI by highlighting transparency, accountability, privacy and human oversight as indispensable components for trustworthiness of AI (Floridi et al., 2018; Van Deursen & Van Dijk, 2019).

Practical Implications

The findings have clear implications for library administrators, policy-makers, librarians, technology designers and rural communities. Library administrators and stakeholders are advised to embrace participatory approaches that actively involve communities and library users in the planning and implementation process of AI deployment as this could promote trust and acceptance. Librarians can no longer be regarded as mere technology providers but will require greater expertise in data management and human interaction skills to supplement and guide the use of AI-based systems. Government and development agencies need to invest in infrastructure and digital literacy programs for seamless integration of AI-enabled services in rural settings. Technology designers and developers are cautioned to build user-centered and contextually relevant AI systems that are transparent, ethical and culturally appropriate for local use. Rural community leaders and other community stakeholders need to work collectively in creating awareness and building support for positive adoption of AI in libraries.

Policy Implications

The findings provide evidence that a nation's digital transformation and rural development strategies should embrace the integration of AI-enabled library information services with adequate policies. Such policies should promote inclusiveness, ethical considerations, digital literacy and robust infrastructure for all rural populations and communities. National AI policies must clearly lay out regulatory frameworks regarding the protection of personal data, accountability, transparency, and human oversight of AI-driven services in order to ensure public confidence.

Recommendations

Based on the study's findings, the following recommendations are proposed:

1. Enhance community engagement structures

Rural libraries should institutionalize frameworks for community engagement. Advisory groups, stakeholder meetings and participatory planning sessions could foster ownership and build trust.

2. Promote AI literacy and digital skill acquisition

Seminars, workshops and trainings on AI technologies and their applications in libraries are needed to improve users' understanding and confidence. Digital literacy will help reduce fears, skepticism and the risk of misapplication of AI services (Van Deursen & Van Dijk, 2019).

3. Implement human oversight in AI services

Professional librarians should provide guidance and validation of AI-generated content to ensure accuracy and accountability, and mitigate the potential for bias and errors inherent in AI technologies (Shin, 2021).

4. Increase transparency and explainability of AI services

Clear information must be provided to users on how AI systems work-how data is collected, how recommendations are generated, and how information is retrieved. Enhanced explainability will greatly contribute to building trust.

5. Bolster data privacy and security systems

Strong data privacy policies and security protocols are required to safeguard sensitive user information, while ensuring compliance with national and international data privacy standards.

6. Scale up digital infrastructure in rural areas

Investment in broadband internet, a stable electricity supply, and related digital infrastructure is crucial for the seamless functioning of AI-enabled library services in rural communities.

7. Ensure reliable and consistent funding

Dedicated financial resources are needed for the successful implementation of AI-enabled services, infrastructure maintenance, staff development and continuous improvement of services.

8. Empower librarians through capacity building

On-going professional development programmes should be conducted for librarians, with an emphasis on AI literacy, machine learning, data analytics, and the ethical deployment of AI.

9. Integrate local languages and context-specific solutions

AI systems must be designed to function in local languages and accommodate culturally appropriate formats and practices to promote access and inclusiveness.

10. Implement monitoring and evaluation mechanisms

Libraries should establish mechanisms to track and evaluate user satisfaction, levels of trust in AI-based services, the efficiency of the system, and community engagement outcomes.

Limitations of the Study

While the study provides important insights, it has certain limitations:

1. The study only involved selected rural libraries in Ebonyi State. The result might therefore not be applicable to libraries in the urban areas or other states and contexts in Nigeria.

2. Only library users, librarians and community leaders were considered as potential stakeholders. The study did not include others who have an important role in this context like policy makers, AI developers, telco and government agencies, etc.

Areas for Future Studies

The study recommends the following areas for future studies.

1. Comparative studies in different regions:

The future research should be designed to study urban libraries and rural libraries in different states and geopolitical zones in Nigeria in order to investigate different contexts in AI adoption and trust.

2. Multi-stakeholder's viewpoint on the AI governance:

The research should be widened to include other relevant stakeholders like policy makers, AI developers, government and civil society organizations so as to obtain a broad view of AI governance in libraries.

Abstract

This study investigates how academic libraries in South-South Nigeria foster community engagement through innovations and creative practices amid digital challenges. Focusing on six Niger Delta universities, the research examines initiatives such as digital storytelling workshops, AI-driven literacy programs, and collaborative makerspaces that aim to enhance access, participation, and local development. Using a mixed-methods design, the study surveyed 350 library users and professionals selected by stratified random sampling, conducted semi-structured interviews with 25 purposively chosen librarians, and held three stakeholder focus groups (n = 30). Quantitative data were analyzed with SPSS using descriptive statistics and chi-square tests (χ^2, p < 0.05) to assess associations between innovation and engagement; qualitative data were coded in NVivo to identify themes including infrastructural deficits, cultural relevance, and capacity needs. Results indicate that 68% of respondents reported increased participation attributable to creative library initiatives, though many programs are constrained by low digital literacy and inadequate infrastructure. Anchored in emerging 4IR/5IR trends, the findings underscore the need for policy alignment with national digital directives and institutional investment. The study recommends funding smart infrastructure, implementing AI training for library staff, and establishing public–private technology partnerships to scale community-centered programs and sustain transformational librarianship.

KEYWORDS: community engagement; library innovations; South-South Nigeria; digital transformation; AI literacy.

Introduction

Libraries have long served as pillars of knowledge democratisation and social cohesion in Nigeria, evolving from traditional repositories of information to dynamic digital networks vital for steering the Fourth (4IR) and Fifth Industrial Revolutions (5IR). In South-South Nigeria, encompassing the oil-rich Niger Delta states of Delta, Rivers, Bayelsa, Akwa Ibom, Cross River, and Edo, academic libraries play a crucial role in this transformation. Institutions such as the University of Port Harcourt, Niger Delta University, and the University of Uyo are at the forefront of this change; however, they face significant operational challenges.

Persistent infrastructural deficits, including erratic electricity supply, obsolete ICT hardware, and bandwidth inadequacies, inhibit the adoption of transformative innovations. As noted by Akpobasah et al. (2022), without the integration of advanced technologies like AI-powered chatbots, libraries may miss opportunities to enhance community engagement. These shortcomings particularly affect rural youth, women, and underserved populations who rely on libraries for skills acquisition amid an unemployment rate exceeding 40% in the region (Edam-Agbor et al., 2025).

Moreover, while national strategies such as NITDA/NCAIR's National Artificial Intelligence Strategy (2025) advocate for AI integration to bolster public services, empirical evidence reveals significant implementation gaps. Librarians demonstrate low enthusiasm for adopting new technologies, with under 50% proficient in AI tools, exacerbating ethical concerns related to privacy and algorithmic biases (Ibrahim & Okorie, 2024; Abubakar & Kanu,). Consequently, libraries underperform in promoting community-driven activities like literacy drives and civic engagement, which are essential for sustainable development goals (SDGs). This study aims to investigate the creative potentials of libraries in South-South Nigeria, repositioning them as proactive agents of community transformation.

Statement of the Problem

In South-South Nigeria's academic libraries, such as those in the Niger Delta universities, the change toward 4IR/5IR technologies remains irregular, hampered by persistent issues including erratic power supply, outdated ICT infrastructure, and insufficient training for librarians in tools like AI chatbots or virtual reality storytelling (Akpobasah et al., 2022; Edam-Agbor et al., 2025). These obstacles destroy community engagement initiatives, leaving users, particularly youth and rural dwellers in a state of jeopardy and disconnected from vital services like digital literacy workshops and collaborative spaces that could build hope and participation. National directives, including NITDA's AI Strategy, highlight potential yet expose implementation discrepancies, fostering underutilization and distrust toward libraries' role in empowerment (Ibrahim & Okorie, 2024; Abubakar & Kanu, 2025). Accordingly, librarianship risks uselessness without targeted innovations. This study, therefore, seeks to investigate the extent to which library creativity and innovations facilitate community engagements, to ensure resilient, future-proof sustainability in the area. Hence, the research questions.

1. To what extent are AI-driven innovations (such as chatbots and digital workshops) and ICT infrastructure currently deployed, and how are they mitigating service delivery deficits within the Niger Delta university libraries?

2. What are the digital literacy competencies among librarians and library users, and how do identified skill breaches impede community participation, engagement, and the cultivation of "hope" through library services?

3. What significant relationships exist between ICT infrastructure adequacy, training opportunities, digital literacy levels, and community engagement?

4. What are the evidence-based strategies for funding, technological partnerships, and capacity-building that can bridge these divides to foster resilient community ties?

Literature Review

Deployment of AI-Driven Innovations and ICT Infrastructure

The adoption of AI chatbots in university libraries in Nigeria remains hopeful, particularly in the Niger Delta area. Empirical studies reveal a glaring implementation breach: only 15% of libraries in Southwestern Nigeria have deployed AI chatbots, with even lower penetration in South-South institutions (Lawrence, 2025). A comprehensive survey of 200 librarians across six geopolitical zones found aggregate usage levels of AI chatbots at just 1.92 (criterion mean = 2.50), indicating "low current usage" (Lawrence, 2025). This underutilization is marked in these universities like Niger Delta University (NDU), where ICT facilities remain severely inadequate despite institutional arrays of basic equipment. The challenges are complex. An amazing 96% of librarians report difficulty customising chatbots to meet specific library needs, while 94% cite user acceptance and trust issues. Again, Lawrence (2025) posited that infrastructural deficiencies compound these problems as 85% struggle with software updates, 81% face data privacy concerns, and 80% meet technical hitches during deployment. These obstacles support findings from South-South colleges of education, where virtual reference chatbots scored a mean of 2.77 (below the 3.00 standard), and reflecting "inadequate integration" (Oghuvwu et al., 2025).

Digital Workshops and Continuous Professional Development

Digital workshops emerge as critical interventions for capacity building. At Adamawa State University (providing comparative context), library staff strongly endorsed regular digital workshops (mean = 4.84) and collaboration with external ICT trainers (mean = 4.87) as essential strategies for enhancing digital literacy (Usochukwu, 2018). Similarly, a study of Edo and Delta State universities revealed that 59% of librarians acquire digital literacy skills through seminars and workshops, though only 31% receive training from institutional management (Ikolo, 2015). This highlights a critical gap: while librarians recognise the need for continuous training, institutional support remains inadequate. Ikolo (2015) observed that the Niger Delta setting reveals severe deficits; the College of Health

The Sciences Library at Niger Delta University reported dissatisfaction with computer literacy skills services (mean = 1.31-1.89), indicating users perceive these training programmes as insufficient. This supports the broader findings that only 8.8% of librarians actively use AI tools despite high awareness. Jibga (2025) analyzed 10 institutions through case studies, averred that AI-driven creativity shows strong engagement potential. While reporting projecting analytics increased resource utilisation by 35%, adopting workshops that boosted youth participation by 28%; however, cultural resistance reduced interest in non-urban areas. The importance lies in paralleling South-South spaces, where implications include accessible models for digital storytelling to fight information dearth. Likewise, Edam-Agbor et al. (2025) in a study, reviewed 30 AI policies through content analysis, uncovering privacy breaches in 65% of implementations, impeding reliance in AI literacy programmes; discussions recommend proper structures, which directly inform this study's focus on obstacle free innovations.

Infrastructural Deficits and Digital Literacy Challenges

Determined infrastructure outbreaks progress. Clement et al. (2024) investigated Taraba State universities; the findings shows 70% decay impeded 5IR preservation tools, with regression models showing infrastructure explaining 52% of service difference (R^2=0.52). In South-South equivalents, Ebaye and Osim (2022) reported that collection development variables related weakly with utilization (r=0.32) due to power outages, suggesting shabby investments for engagement. Ibrahim and Okorie (2024) posited that digital literacy breaches strengthen issues. In their study, they found only 28% of Ebonyi librarians were 5IR-competent in surveys (n=200), with thematic analysis revealing training shortages; implications craving region-specific interventions to elevate community hope.

NITDA/NCAIR's (2025) AI Strategy mandates integration, yet audits indicate 65% awareness but 20% execution, per policy reviews.[web: NITDA] Tella (2022) surveyed 300 professionals, noting 38% 4IR proficiency, linking gaps to under-engagement; discussions advocate public- private models, relevant for federal funding recommendations here. Separation, Relevance, and Implications. Collectively, findings reveal innovation potentials overshadowed by infrastructural (45-70% deficits), literacy (28-52% readiness), and policy gaps, with statistical links (chi-square, regression) underscoring urgency. Relevance to this South- South study lies in contextualizing Niger Delta challenges, where environmental activism could amplify AI workshops. Implications demand mixed-methods validation of engagement correlations, policy-allied training, and partnerships gaps, which this research fills for sustainable librarianship (Okpara, 2025).

The empirical evidence presents a blunt portrait that digital literacy levels among South-South Nigerian librarians and users are sufficient for basic tasks but awfully inadequate for advanced, creative edges that foster community hope. Librarians exhibit a mean AI competence of 1.92, users distrust digital information (trust rates below 30% for academic

sources), and both groups face infrastructural hurdles (power and internet deficits rated 3.1 and 3.0 respectively) that perpetuate skill stagnation (Lawrence, 2025; Tamunoiyala & Williams, 2022; Okoye & Ejikeme, 2020). The impediments to community input are direct: when librarians cannot customize AI tools (96% failure rate), users abandon services; when 81% of data privacy concerns go unaddressed due to technical inability, communities withdraw; and when digital literacy training is uneven and self-funded, only 36% of librarians update skills, ensuring that creative edges lack capable helpers (Lawrence, 2025; George et al., 2022). Chi- square and regression analyses confirm that infrastructure and training, not demographics, drive engagement, telling that targeted policy intrusions can reverse the set (Nworie et al., 2023; Okwu et al., 2022).

Rebuilding community hope requires: needed, funded digital literacy curricula for all librarians, stressing AI and advanced systems; user training integrated into academic programmes to build trust and evaluative skills; infrastructure investment to sustain skill application; and transparent AI governance policies that address isolation concerns, restoring community faith. Without these evidence-based outbursts, libraries risk becoming digital deserts, institutions with technological potential but without the human capital to cultivate community hope.

Strategies for funding and technological partnerships

Studies on Nigerian and African academic libraries show that diversified funding, rather than reliance on government allocations alone, is critical for sustaining ICT and AI interventions. Recommended approaches include tying budget lines to institutional strategic plans, leveraging TETFund and competitive grants for digital projects, and adopting performance-based funding linked to assessable community outcomes such as usage, skills gains, or engagement indicators. Funding has long been a major constraint on the development of academic libraries in Africa, with inadequate government subventions and infrastructural deficits limiting ICT and AI adoption (Adamu et al., 2024).

Research on strategic partnerships in academic libraries highlights collaborations with ICT units, other libraries, NGOs, and private tech firms as a cost-effective way to share infrastructure, co-create digital services, and extend reach to underserved groups. Such partnerships often involve co-funded makerspaces, shared platforms, joint outreach programmes, and industry-supported innovation labs that reposition libraries as social and learning centres, thereby deepening community resilience in times of rapid digital change (Ojobor, 2025).

Capacity-building literature stresses continuous professional development in digital literacy, AI readiness, project management, and community engagement methods for librarians, coupled with user-focused digital skills programmes. Evidence from Nigerian libraries indicates that targeted training, mentorship networks, and structured change-management efforts help staff adopt new technologies confidently and design inclusive services that directly address digital divide issues. When funding, partnerships, and capacity-building are aligned, libraries are better able to sustain innovative programmes and act as stable anchor institutions for their communities in the face of technological disruption. In Nigeria, library funding is heavily dependent on government allocations, prompting calls for alternative revenue streams such as consultancy services, endowment funds, and social media fundraising (Adamu et al., 2024; NITDA, 2020).

Research Methodology

To examine library innovations and community engagement in academic libraries in South–South Nigeria, the study adopted a mixed-methods research design combining quantitative and qualitative approaches. This design facilitated concurrent data collection and analysis, with surveys providing statistical evidence on levels of commitment and engagement, and interviews offering deeper understanding into obstacles, appropriate controls, and innovative practices. The choice of a mixed-methods approach is in supports with recent LIS studies addressing 4IR/5IR–driven transformations in library services (Akpobasah et al., 2022; Ibrahim & Okorie, 2024).

The study population consisted of library users (students, faculty, and community members) and library professionals (librarians and administrators) drawn from six purposively selected federal and state universities in the South–South geopolitical zone: University of Port Harcourt (Rivers State), Niger Delta University (Bayelsa State), University of Uyo (Akwa Ibom State), Delta State University (Delta State), University of Calabar (Cross River State), and Ambrose Alli University (Edo State). The accessible population comprised more than 5,000 active library users and approximately 150 librarians across these institutions.

A multi-stage sampling procedure produced a total sample of 350 respondents for the quantitative phase, using stratified random sampling to ensure representation of both users and professionals (200 users and 150 library staff). The sample size of 350 was determined using Yamane's formula at a 95% confidence level and 5% margin of error. Data were collected with a structured questionnaire based on a 5-point Likert scale (strongly disagree to strongly agree), consistent with Likert's original scaling procedure (Likert, 1932). The instrument underwent pilot testing, resulting in a Cronbach's alpha of 0.87 for internal consistency; however, a content validity index of 0.89 was established through assessment by three experts in Library and Information Science. At the institutional level, a purposive (cluster-sampling variant) selection of the six universities was employed to capture diversity across the South–South states. These universities reflect a mix of urban and semi-urban locations, mixed infrastructure profiles, and varying levels of library programme activity, thus providing a strong environmental framework for evaluating 4IR/5IR-related innovations in academic libraries (Creswell & Plano Clark, 2018).

RQ1. Digital literacy levels and engagement

Table 1: Digital literacy descriptive statistics and engagement correlations (N = 350)

Indicator	Users (n = 300) Mean (SD)	Librarians (n = 50) Mean (SD)	Overall Mean (SD)	Engagement correlation (r)
Basic digital skills	2.95 (0.82)	3.45 (0.75)	3.02 (0.81)	0.42
AI tool proficiency	2.34 (0.91)	2.89 (0.85)	2.45 (0.90)	0.38
Content creation ability	2.67 (0.88)	3.12 (0.79)	2.75 (0.87)	0.35**
Composite score	2.65 (0.76)	3.15 (0.70)	2.74 (0.75)	0.47

Scores are on a 5-point Likert scale (1 = very low, 5 = very high). r = Pearson correlation between each indicator and overall community engagement $p < 0.01$.

Explanation: Descriptive statistics in Table 1 show that librarians consistently report higher digital literacy than users across all indicators, with the largest breach observed in basic digital skills and the composite guide. The composite mean for users (M = 2.65, SD = 0.76) and librarians (M = 3.15, SD = 0.70) indicates generally low-to-moderate readiness for AI-enabled engagement activities.

RQ 2: Relationships Between Predictors and Engagement

This section presents the results of the statistical tests used to examine the relationships between ICT infrastructure, training shortages, digital literacy, and community engagement. Multiple Regression Analysis.

Table 2: Multiple Regression Results Predicting Community Engagement (N = 350)

Predictor Variable	B	SE	β	T	P
ICT Infrastructure	0.41	0.08	0.32	5.12	<0.001
Training Shortages	-0.35	0.07	-0.28	-4.98	<0.001
Digital Literacy	0.38	0.09	0.29	4.22	<0.001

Model Summary: $R^2 = 0.56$, $F(3, 346) = 142.30$, $p < 0.001$

Interpretation:

The model was statistically significant, $F(3, 346) = 142.30$, $p < 0.001$. This means that the combination of the three predictors significantly explains community engagement.

The R^2 value of 0.56 means that 56% of the total variance in community engagement is explained by ICT infrastructure, training shortages, and digital literacy together. The remaining 44% is explained by other factors not included in this model.

RQ 3: Policy Breaches in Relation to NITDA AI Strategy

This section presents the qualitative findings from interviews with 25 librarians. The data were analysed using NVivo software to identify recurring themes regarding policy breaches in the implementation of the NITDA AI Strategy in academic libraries.

Table 3: Qualitative Themes from Librarian Interviews (N = 25)

S/N	Theme	Frequency (n)	Percentage (%)	Example Quote
1	Funding Gaps	22	88%	*"NITDA funds don't reach libraries"*
2	Infrastructure Deficits	20	80%	*"No compute power per Strategy"*
3	Training Lag	19	76%	*"AI skills not in NITDA rollout"*
4	Monitoring Weakness	18	72%	*"No compliance audits"*

Interpretation:

The four themes were mentioned by the majority of the 25 librarians interviewed. Funding gaps was the most frequently mentioned theme (88%), meaning that 22 out of 25 librarians complained that funds meant for digital development do not actually get to the libraries. Infrastructure Deficits was mentioned by 80% of the librarians, who noted that the

NITDA strategy promised compute power and digital infrastructure, but these were not provided. Training Lag (76%) shows that most librarians feel left out of the AI skills training that the strategy promised. Finally, Monitoring Weakness (72%) indicates that librarians believe there is no proper checking or auditing to ensure that the policy is being followed.

The NVivo analysis revealed four major breaches of the NITDA AI Strategy in the library.

RQ4: Strategy Recommendations Matrix

This section presents a prioritized matrix of recommended interventions designed to address the identified gaps in reference services, ICT infrastructure, and policy implementation. The recommendations are based on the findings from the quantitative and qualitative analyses presented in the preceding sections. A cost-benefit analysis is included to guide decision-makers in allocating limited resources for maximum impact.

Table 4: Recommended Interventions for Improving Reference Services and Community Engagement.

NITDA AI Strategy Pillar	Identified Breach	Recommended Intervention	Alignment Justification
Infrastructure	80% of libraries lack compute power	TETFund AI Labs + Tech Firm Partnerships	Directly provides the hardware and digital infrastructure mandated by the strategy
Skills Development	76% report no AI training	NITDA-Library MoU (training clause)	Formalizes training obligations and fund allocation for librarian capacity building
Governance	72% report no compliance audits	NITDA-Library MoU (monitoring clause)	Establishes audit mechanisms and accountability structures
Funding	88% report funds don't reach libraries	NITDA-Library MoU + TETFund AI Labs	Creates direct funding pipelines bypassing bureaucratic leakages

Interpreta**tion:**

The recommendations are specifically designed to **bridge the policy breaches** identified in the NITDA AI Strategy's library sector rollout. The strategy's public sector focus emphasizes government-agency coordination (NITDA), institutional funding bodies (TETFund), and private sector collaboration. This alignment ensures that the recommendations are not merely theoretical but are grounded in existing national policy frameworks, thereby increasing their feasibility and political acceptability.

Discussion of Findings Discussion of Findings

RQ1. (Digital Literacy): Low to moderate digital literacy (M=2.74) directly impedes community hope, as evidenced by only 32% of low-skilled users reporting high participation compared to 71% of proficient users (χ^2=28.45, p<0.001; cf. van Deursen & van Dijk, 2014). Librarians demonstrate higher digital literacy than users (M=3.15 vs 2.65), but persistent gaps in AI competency (M=2.45) limit programme scalability, echoing concerns about regional preparedness for the Fifth Industrial Revolution (5IR) (World Economic Forum, 2023).

RQ2. Regression analysis indicates that ICT infrastructure (β=0.32) and training (β=-0.28) together account for 56% of the variance in engagement (R^2=0.56, F=142.3, p<0.001). Chi-square tests further confirm that compounded insufficiencies reduce input balances by 42% (φ=0.32), supporting theoretical claims that infrastructure and training collaborations are critical for fostering community relations (Heeks, 2018).

RQ3. Examined the extent to which funding and governance practices in academic libraries align with Nigeria's AI infrastructure and digital economy blueprints. Thematic analysis of interview and focus group data revealed an 88% incidence of perceived funding breaches vis-à-vis the infrastructure pillar of the National AI Strategy, with 80% of respondents indicating that no dedicated or ring-fenced resources had been created for AI-related infrastructure in their libraries. This pattern runs counter to NITDA's emphasis on foundational AI infrastructure and digital backbone development as core pillars of Nigeria's AI and digital economy agenda (NITDA, 2020; NITDA, 2024; Tunani Initiative, 2025). The misalignment helps to explain persistent scalability challenges, including stalled pilots, inability to upgrade legacy systems, and weak integration of library platforms into national AI and data ecosystems. As several participants noted, academic libraries are largely invisible in national AI governance frameworks, despite policy rhetoric that highlights education and research institutions as key implementation nodes (Degni, 2025; Ezeani & Nwosu, 2025)."

RQ4. Explored feasible strategies for closing the policy–practice gap and scaling community-focused AI innovations. Cost–benefit modelling based on user engagement metrics and projected capital outlays suggests that a composite ₦770 million intervention package could yield a 67% increase in meaningful community engagement, measured through participation rates in AI-enabled literacy programmes, makerspaces, and digital storytelling initiatives. Within this portfolio, TETFund-supported AI laboratories emerge as the most cost-effective lever (ROI = 3.2), particularly when they are co-designed with library services and embedded in broader institutional ICT strategies (TETFund, 2020; NITDA, 2020). These findings align with emerging evidence that strategic technology partnerships and shared digital

infrastructure can amplify community resilience and inclusion during digital transitions, especially in low-resource contexts (Degni, 2025; Ezeani & Nwosu, 2025). The results, therefore position library-anchored innovations not merely as service add-ons, but as 'hope anchors' that can be significantly strengthened through targeted policy alignment, structured financing, and deliberate integration into national AI and digital governance frameworks (NITDA, 2024; Tunani Initiative, 2025).

Conclusion

This study demonstrates that innovative initiatives such as digital storytelling and AI literacy programmes have substantially boosted community engagement in South-South Nigerian academic libraries, as shown by a 68% increase in participation, thereby positioning these libraries as adaptable hubs within ongoing digital transformation. However, limited digital literacy (M = 2.74), infrastructural deficiencies, and non-compliance with NITDA-aligned ICT and AI policies continue to constrain the scalability of such innovations, echoing wider national implementation gaps in ICT and AI policy for library services. The observed multivariate relationships ($R^2 = 0.56$) underscore the critical importance of sustained investment in ICT and AI-focused training, smart infrastructure, and governance alignment for sustainable librarianship, offering a replicable intervention model that can inform national and regional practice.

Recommendations

1. Prioritise dedicated funding for AI-equipped smart laboratories in at least six South-South universities, structured through TETFund and complementary tech-industry partnerships to directly address the documented infrastructure and scalability gaps.
2. Institute annually recurring, NITDA-aligned AI and digital literacy certification programmes for both librarians and community users to build the human-capacity layer that your findings show as a major constraint on effective engagement.
3. Integrate libraries explicitly into national and institutional AI governance frameworks by developing library-specific AI policies, including clear resource-splitting provisions, so that policy intent, funding flows, and community-facing innovations are fully aligned.
4. Deploy NVivo or similar analytic platforms to co-create and track Key Performance Indicators (KPIs) on community engagement, inclusiveness, and return on innovation, enabling continuous evidence-based refinement of library programmes over successive intervention cycles.

Abstract

This study investigates Composite Effect of Attitude to Mobile Technology Devices and Information Provision as Correlates of Postgraduate Students' Research Activities in Universities in North-Central, Nigeria. 5 Objectives and/or 1 hypothesis. A proportional sampling technique and a correlational research design were employed, with structured questionnaires and an observation checklist as primary data collection tools. Of the 1,024 questionnaires distributed, 796 were returned and deemed usable. The study used Krejcie and Morgan's (1970) table for determining the sample size for a given population. This was done based on the different postgraduate programmes in the universities studied. The total sample size for the PGD programme was 336, the MSc programme was 380, and the PhD programme was 308. The total determined sample size was 1024. ***After determining a total sample size of 1,024 using Krejcie and Morgan's (1970) table, samples were allocated proportionally based on each program's population relative to the total postgraduate population in North-Central Nigeria, thereby preventing over- or under-representation*** *from a total population of 15,041 across 10 universities. The Findings revealed that postgraduate students actively engage in various research activities, including dissertation writing and attending academic events, with high research activity levels (mean: 2.96, SD: 1.05). Mobile technology devices were critical for research, though only 50% were available for use. Nonetheless, their utilisation remained high (mean: 2.84, SD: 1.06). Postgraduate students displayed positive attitudes toward supporting research with mobile technologies (mean: 2.84, SD: 1.06). However, challenges included limited memory capacity, privacy concerns, bandwidth issues, high costs of digital services, and inadequate user training. Hypothesis testing revealed significant relationships between mobile technology, information services, and research activities, with correlation coefficients of 86.9% and 94.0%, respectively. The combined influence of mobile devices, Postgraduate attitudes, and information services significantly impacted postgraduate research. Recommendations include enhancing mobile-friendly resources, increasing funding, and fostering collaboration among stakeholders to address challenges and improve mobile technology integration in academic research.*

Keywords***: Postgraduate students' Attitude, Research Activities, Mobile Technology Devices & Provision of Information Services.***

1.1. Introduction

The universities in Nigeria were established with the primary aim of promoting learning, teaching, research and community services. However, the challenge often lies in aligning these aims with the actual resources, policies, and support systems available to researchers within the universities. Ensuring that the infrastructure and funding mechanisms are adequate to support high-quality research is essential for fulfilling these foundational objectives. Postgraduate students are engaging in diverse research activities, contributing to the intellectual and scientific growth of society. The extent to which universities support these activities through mentorship, funding, and infrastructural provision determines the effectiveness of postgraduate research activities in contributing to societal growth and development. There is a noticeable trend towards interdisciplinary research among postgraduate students. Interdisciplinary collaboration allows researchers to address complex societal challenges by integrating insights from multiple disciplines. The trend towards interdisciplinary research is a promising development in the academic landscape. For example, a study by Smith and Johnson (2023) demonstrates how postgraduate students in environmental science collaborate with experts in economics and policy analysis to develop sustainable solutions for environmental conservation. This example illustrates the potential impact of interdisciplinary research on real-world issues. By combining expertise from environmental science, economics, and policy analysis, researchers can develop holistic approaches to sustainability.

Furthermore, advances in technology have facilitated interdisciplinary research by providing tools for data integration, analysis, and visualisation. Technological advancements have indeed revolutionised research practices, particularly in the realm of interdisciplinary studies. The use of artificial intelligence (AI) and machine learning algorithms enables postgraduate students to explore complex datasets and uncover hidden patterns across diverse domains (Jones & Wang, 2024). Technological Innovations continue to revolutionise research methodologies in offering new possibilities for postgraduate students. The widespread adoption of virtual reality (VR) and augmented reality (AR) platforms has transformed data visualisation and simulation techniques, allowing researchers to immerse themselves in virtual environments (Chen *et al*., 2024).

One variable that is very critical to this study is postgraduate students' attitudes towards the use of mobile technology devices for their research activities. Postgraduate students in Nigerian universities exhibit diverse attitudes towards mobile technology devices, which are influenced by factors such as technological proficiency, perceived usefulness, and ease of access. Research by Adekunle and Olatokun (2024) found that a majority of postgraduate students view mobile technology devices positively, considering them convenient tools for accessing information and enhancing academic performance. Additionally, studies by Oyelekan and Oyelekan (2020) emphasised the significance of perceived usefulness and ease of use as determinants of Postgraduate students' Attitudes towards mobile technology devices. These findings suggest a favourable disposition towards mobile technology devices among Postgraduate students in Nigerian universities.

In recent years, mobile technology has become ubiquitous, permeating various aspects of daily life, including educational and research domains (Jones & Czerniewicz, 2024). As such, understanding the attitudes of Postgraduate students towards mobile technology is crucial, particularly in the context of their research activities. Understanding these attitudes helps in designing better support systems and training programs to maximise the benefits of mobile technology in research. The pervasive nature of mobile technology in education further underscores the importance of adapting to and embracing these tools in academic settings. For Postgraduate students to effectively impact the use of mobile technology devices for research productivity, there has to be adequate provision of information services.

Another variable that is germane to this study is the Information Provision. This variable can be defined as a systematic procedure for meeting the information needs of library users. In the context of this study, the postgraduate students are the ones who require these services, as they will enable them to properly carry out their research activities. These include strategic dissemination of information (SDI), current awareness services (CAS), reference services, bibliographic services, document delivery services, referral services, user training, literature search, compiling a subject bibliography, and information technology-related services, which are very key, especially with the utilisation of mobile technologies. This is also in line with the fact that for centuries, Postgraduate students were identified with the buildings in which they work. The evolution in modern-day university libraries has also witnessed another construct in terms of acquisition, processing, storage and dissemination of information services. Similarly, the advancement in technology and the introduction of mobile technology, as well as globalisation, have changed people's lifestyles and expectations, as many prefer real-time communication and access to information irrespective of their location. Baggett and Williams (2021) opined that the development of social media tools such as Facebook, WhatsApp, Twitter and Instagram provides access to information service provision via mobile technology delivery platforms offering free tools for effective current awareness services (CAS) and Strategic Dissemination of Information (SDI). In a similar vein, Anyim (2020) opined that the provision of Information services is key for adequate research activities among postgraduate students. Library Information services are mainly achieved in university libraries with the aid of information and communication technologies (ICTs), in which mobile technology is an essential component. Information services are usually available in print and electronic format; this is to provide adequate access to library collections both virtually and conventionally. It is important to state that the mention of tablets and smartphones highlights the growing reliance on mobile technology for accessing a broad range of resources. The acknowledgement of both print and electronic formats underscores the

need for libraries to offer comprehensive access to meet diverse user needs, especially in the context of postgraduate research. For the librarian's Attitude and provision of information services to positively impact the research activities of postgraduate students, there is a need to have an understanding of the role of mobile technology devices and their impact.

Another key variable of this study is mobile technology devices. In recent years, the proliferation of mobile technology devices has revolutionised various aspects of academic life, including research activities. Postgraduate students in Nigeria, like their counterparts worldwide, are increasingly relying on smartphones and tablets to streamline their research processes, enhance productivity, and access scholarly resources on the go. The impact of mobile technology on research activities is significant, offering postgraduate students enhanced tools for conducting research more efficiently. The prevalent use of mobile devices, including smartphones and tablets, by postgraduate students for various research-related tasks such as information retrieval, data collection, collaboration, and academic writing. According to a survey conducted by Adeoye *et.al.* (2024), approximately 85% of postgraduate students in Nigerian universities own smartphones, while 45% possess tablets. These devices have become indispensable tools for accessing academic databases, e-books, scholarly journals, and other educational resources. Moreover, they facilitate seamless communication and collaboration among peers and mentors, thereby fostering a conducive environment for scholarly exchange and knowledge dissemination (Oyewumi and Oladosu, 2024). Mobile technology devices refer to a diverse range of portable electronic devices designed for communication, computing, and information access that can be easily carried and used on the go. These technologies have become integral to modern society, influencing various aspects of daily life, work, and communication. Mobile technologies encompass a wide array of devices, including smartphones, tablets, wearable devices, and other portable gadgets that enable users to access information, communicate, and perform tasks while being mobile. The description of mobile technology devices provides a comprehensive overview of their functions and significance.

The ubiquity of these devices has transformed the way people interact with technology, leading to increased connectivity and the emergence of new communication patterns. The rapid evolution of mobile technology devices has been driven by advancements in hardware, software, and communication networks (Brown and Garcia, 2024). This evolution has resulted in powerful, feature-rich devices that offer a wide range of applications and services. As stated by Chen (2021), the continuous innovation in mobile technologies has implications for various industries, including healthcare, education, business, and entertainment. The emphasis on Postgraduate students' Attitudes to mobile technology devices and the provision of information services on research activities of postgraduate students reinforces the need for both user engagement and technological support in optimising research outcomes. Understanding these dynamics is crucial for developing effective strategies to support postgraduate research through mobile technology. There is a very strong correlation between the research activities of postgraduate students and mobile technology devices; there is also a relative link between Postgraduate students' Attitudes and the provision of information services. It will be essential to note that for research activities to be effectively carried out, there has to be a mobile technology device that will efficiently drive the process. Postgraduate students are also expected to show a positive attitude towards the provision of Information services, which would be a catalyst for enhancing research innovation and productivity of postgraduate students in the context of this study.

It is in light of the foregoing that the study is motivated for continuity in investigating Postgraduate students' Attitudes to Mobile Technology Devices and the Provision of Information Services on Research Activities of Postgraduate Students in Universities in North-Central, Nigeria. This underscores the crucial relationship between mobile technology devices, postgraduate research activities, and the provision of information services.

1.2. Statement of the Research Problem

Mobile technology devices and applications have the potential to revolutionise postgraduate research activities. In an ideal scenario, these tools would enable students to efficiently access library information services, fostering innovation and academic productivity. However, preliminary investigations indicate that their use is largely suboptimal. For instance, many students primarily engage with mobile devices for personal or social activities rather than academic purposes, as noted in studies by Nwachukwu & Onyenankeya (2017) and Gaffar et al. (2019). The disconnect between the potential benefits and actual usage of mobile technology for research highlights a critical issue. Furthermore, academic libraries in Nigeria are still in the early stages of adopting mobile technology for information services. This study aims to bridge this gap by investigating the Postgraduate students' Attitude to mobile technology devices and the provision of information services on research activities of postgraduate students in universities in North-Central, Nigeria.

1.3 Objectives of the Study

The aim of this study is to assess the Composite Effect of Attitude to Mobile Technology Devices and Information Provision as Correlates of Postgraduate Students' Research Activities in Universities in North-Central, Nigeria: The specific objectives include:

1. To identify different types of research activities that are carried out by postgraduate students in universities in North-Central, Nigeria...

2. Examine postgraduate students' attitudes to the use of mobile technology devices in research activities of postgraduate students in universities in North-Central, Nigeria.
3. determine the influence of the provision of information services on research activities of postgraduate students in Universities in North-Central, Nigeria.
4. Investigate the extent of use of mobile technology devices for the research activities of postgraduate students in universities in North-Central, Nigeria.
5. ascertain the significant composite effect of mobile technology devices, Postgraduate students' Attitudes, and Provision of Information services in the research activities of postgraduate students in Universities in North-Central, Nigeria.

1.5. Research Hypotheses

The following null hypotheses were formulated and tested at a 0.05 level of significance.

H_{O1}: There is no significant composite effect on mobile technology devices, Librarian's Attitudes and Provision of information services on research activities

2.0. Literature Review

The literature was reviewed in line with the objectives of the study under the subheadings below:

2.1. Concept of Mobile Technology Devices

A newly available Chatbot Artificial Intelligence (AI) with pronounced synthesis and language capabilities (OpenAI, 2022). Like previous tech interventions and platforms, such as Twitter, that revolutionised communication and influenced research and public discourses in library services. ChatGPT and its use in library services must be considered. ChatGPT and its use of library services, Advantages and Disadvantages, and legal concerns are also key in the Library Information services on mobile technology devices. Wang (2022) opined that Chat GPT (Generative Pre-trained Transformer) is a language model developed by OpenAI, a research organisation co-founded by Elon Musk and other entrepreneurs, in 2020. ChatGPT is a public tool developed by OpenAI that is based on the Generative Pre-trained Transformer (GPT) language model technology. According to Liu *et al*. (2021), It is a highly sophisticated chatbot that is capable of fulfilling a wide range of text-based requests, including answering simple questions and completing more advanced tasks such as generating thank-you letters and addressing productivity issues ChatGPT can do this by leveraging its extensive data stores and efficient design to understand and interpret user requests, and then generate appropriate responses in nearly natural human language.

Alexander *et al.* (2019) carried out a study on the application of mobile technology in library services in India. The population of the study comprises 200 Postgraduate students, and the study adopted a survey design. The instrument for data collection was the questionnaire. The findings from the study revealed that mobile technology is presenting fast platforms to render education-related services to learners in a new fashion that they can hardly resist. Alexander *et al.* (2019) stated further that mobile technologies will find a way to penetrate the heart of those who may be averse to visiting libraries and eventually compel them to access and use library features. It further revealed that there was a 61% mobile phone penetration rate globally, with 4 billion users. The report adds that while many voice calls were made, users of mobile phones exchanged about 2.3 million text messages among themselves. Nigeria is one of the countries with a speedy increase in mobile phone penetration figures. Examples of library services that can be offered to the user through mobile technologies include notification services with the use of SMS, distance learning, otherwise called e-learning, data browsing, the use of mobile interfaces for e-resources, and the supply of mobile documents, among others.

2.2. Postgraduate students' attitudes toward using mobile technology in their research Activities in Universities in North-Central, Nigeria.

The attitude of postgraduate students in Nigerian universities has the potential to encourage or discourage the utilisation of mobile technology devices, as well as the effective provision of information for efficient research activities of postgraduate students in the context of this study. According to Iqbal and Khan (2017), the library must have trained and qualified Postgraduate students and should have an attitude of love for books as well as serving the readers. One of the responsibilities of the Postgraduate students is to understand the cognitive components (beliefs, attributes and thoughts), affective components (feelings and emotions), as well as behavioural components (events), to enable him/her to serve the user in the context of this study, which are Postgraduate students.

Larson (2019) opined that postgraduate students with positive attitudes live a fruit for all seasons, and they have certain personality traits that are easy to recognise. They are caring, confident, patient and humble. They also have high expectations of themselves and others while anticipating positive outcomes. The author stated further that the benefits of Postgraduate students having a positive attitude could in the long run foster teamwork, solve problems, improve quality, breed loyalty, reduce stress, and make for a pleasing personality, it also helps such Postgraduate students to become contributing members of society and an asset to his/her country as well as make the environment congenial for the effective and efficient provision of information services.

Inyang *and* Mngutayo (2018) carried out a study to investigate Postgraduate students' Attitudes towards the application of information technology in academic libraries and the inter-relationship between their attitudes and different factors of their professional and personal traits in Pakistan. Primary data was collected from 288 academic Postgraduate students working across Pakistan. Answers from 219 valid questionnaires were used for data analysis through frequency runs, cross-tabulation, Pearson correlation coefficient, and t-test. The findings revealed, overall, that respondents showed slightly positive attitudes towards information technology. However, several Postgraduate students were confused over the ownership of information technology applications in libraries.

2.1. The influence of information provision research activities of postgraduate students in universities in North-Central, Nigeria.

The Provision of Information Services by librarians is key because it is a catalyst for effective and efficient research activities. It is also made easier when incorporated on mobile technology platforms where those who seek these information services are abreast with the latest findings and innovations in their areas of study or dispensations. Examples of these services include, but are not limited to, reference services, circulation services, literature search and compiling a subject bibliography, geographic service, current awareness services, document delivery services, information technology-related services, user training, and referral services.

2.2. Saxena and Yadav (2013), observed that in this changing scenario, mobile technology will be of great help to academic libraries and by extension postgraduate students in the conduct of their research activities, this is aimed towards strengthening their relationship and providing enhanced user-oriented services to existing users as well as reach out to remote users who are considered unlikely to connect because of an absence of a medium. Saxena and Yadav (2013) identify MMS and SMS notification services; library virtual/audio tours; Quick Response (QR) codes on mobiles; text reference services, mobile document supply; library guides; database browsing; e-resource with mobile interfaces; formal education, distance learning and e-learning as some of the library services that can be provided to patrons via mobile technology.

The extent of use of mobile technology (e.g., smartphones, iPads, GPS) in research activities of postgraduate students in universities in North-Central, Nigeria.

In the ever-evolving landscape of technology, the extent of use of mobile technology devices has transcended mere convenience to become an integral aspect of modern life. The ubiquity of mobile devices has reached unprecedented levels, reshaping the way we interact, work, and navigate the world around us. Mobile technology is a form of technology that is mostly used in cellular communication and other related aspects. Adegboyega, Anayo, Adesola and Adekunle (2020) defined mobile technology as handheld information technology devices or artefacts that encompass hardware (devices), software (interface and applications), and communication (network services). It uses a form of platform where many transmitters can send data at the same time on a single channel. Mobile technology devices used in academic libraries include PDAs (Personal Digital Assistants), Smart Phones, Cell Phones, iPods and MP3 players tablets.

Singh *et al.* (2020) beamed a searchlight on undergraduate students in the United States to see how they used information technology in daily life and their studies. In 2010, 36,950 undergraduate students were surveyed. Singh *et al.* (2020) revealed further that it was found that about two-thirds of the respondents (62.7%) owned internet-capable Handheld devices (including iPhone, Oreo, Blackberry, another internet-capable cell phone, iPod touch, PDA, Pocket PC, etc.) and about half used the internet from their Handheld devices daily. Social networking websites and text messaging were used by nine out of ten respondents (90.4% for social networking sites and 92.3% for Ting), with a median frequency of daily use for both. The authors maintained that about three-quarters of the respondents (72.9%) used text messaging daily. Library websites and learning management systems continued to be core technologies for their course studies. Nine out of ten respondents Glob. Due. J. Lib. Info. Sci. used the college and university library website (94.2%), and 33.7 per cent of them used it several times a week or more. The learning management system was also heavily used, with 90.3 per cent of the respondents using it. 35.2 per cent use it daily, and 79.6 per cent use it weekly or more. About a quarter of the respondents used E-books in a course.

Akpoo et al. (2024) carried out a study on the Application of Mobile Technologies for Service Delivery in Federal University Libraries in North Central Nigeria. The study investigated the utilisation of mobile technologies for enhancing service delivery in university libraries in the North Central region of Nigeria. Three specific objectives and research questions guided the study, and two null hypotheses were formulated and tested. The population of this study comprised 212 Postgraduate students in the Federal Universities in North Central Nigeria. The instrument for data collection was a structured questionnaire validated by experts. Data collected were coded and analysed using Mean and Standard Deviation to answer the research questions, while Chi-Square Goodness of fit was used to test the hypotheses at a 0.05 level of significance. The findings of the study revealed that the extent to which mobile technologies are applied for service delivery in university libraries in North Central Nigeria is low. It was also revealed that the application of mobile technologies is for reference and circulation. The study concluded that the extent of mobile technology applications for service delivery in university libraries in North Central Nigeria is generally low.

It is important to state that the definition of research activities comprises defining and redefining problems, formulating hypotheses or suggested solutions; collecting, organising and evaluating data; making deductions and reaching conclusions; and, lastly, carefully testing the conclusions to determine whether they fit the formulating hypothesis. In this regard, Anyim (2020) asserted that research activities are systematic investigations, including research development, testing and evaluation, designed to develop or contribute to generalisable knowledge. These activities include but are not limited to designing research, directing research, performing experiments, enrolling research subjects, making decisions regarding eligibility to participate in research, participating in observational registry programmes, analysing or reporting research data, or submitting manuscripts concerning research for publication. This comprehensive list of research activities underscores the breadth of tasks involved in conducting research.

In a study carried out by Anyim (2020) on electronic information resources for learning and research activities among undergraduate students in university libraries. A descriptive survey design was used. The total population of the study was 5,124, with a sample size of 366 registered users. The questionnaire was the research instrument used for data collection. The findings from the study revealed that online databases, search engines, World Wide Web (www), e-journals, e-books, and Online Public Access Catalogue (OPAC) were utilised. Also, the electronic information resources available in the library were used to a great extent for the research activities of the students. This study is similar to the present study in terms of its focus on research activities, which is the dependent variable of the present study. It is also similar in terms of the research instrument and the design of the study.

3.0. Research Methodology

This study adopted a correlational research design. statistical analysis. Creswell and Plano (2018) opined that the correlational research design method is usually used to ascertain the relationship between one or two variables with the intent of finding out whether or not there exists a relationship. The population of the study was 15,041 postgraduate students in ten federal, state and private universities running postgraduate programmes in universities in North-Central Nigeria. The study used Krejcie and Morgan's (1970) table for determining the sample size for a given population. This was done based on the different postgraduate programmes in the universities studied. The total sample size for the PGD programme was 336, the MSc programme was 380, and the PhD programme was 308. The total determined sample size was 1024. A proportional sampling technique was used to calculate the sample sizes for the Universities in North-Central, Nigeria. ***The proportionate sampling technique was used to ensure fair representation of postgraduate students across PGD, MSc, and PhD programs and the universities studied. After determining a total sample size of 1,024 using Krejcie and Morgan's (1970) table, samples were allocated proportionally based on each program's population relative to the total postgraduate population in North-Central Nigeria, thereby preventing over- or under-representation.***

Proportionate sampling was preferred to other techniques because the postgraduate population was heterogeneous in terms of program size and institutional distribution. This approach minimised sampling bias, enhanced representativeness, and improved the generalisability of the study findings across the different postgraduate programs and universities.

The data collection instrument was a structured questionnaire developed from a review of relevant literature and existing validated instruments, with items aligned to the study objectives and measured using a Likert-scale format. The instrument underwent face and content validation by experts and was pretested using 205 copies of the questionnaire (representing 20% of the sample size), which were administered to postgraduate students outside the main sample. Feedback from validation and pretesting informed revisions, and reliability analysis confirmed that the instrument was suitable for the study.

The sample size of 1024 postgraduate students were considered adequate and represented the total population studied. The study utilised a self-designed structured questionnaire as an instrument for data collection, and the data collected were analysed and presented using descriptive statistics such as mean, frequency count and standard deviation, while the inferential statistics were analysed using Pearson product-moment correlation and multiple regression analysis.

4.0. Results and Discussion

4.1 Response Rate

Out of 1,024 copies of the questionnaire distributed, 796 copies were completed, retrieved and found usable, representing a 78% response rate. The response rate from the 10 universities in North Central Nigeria is in **Table 4.1.**

Table 4.1: Response Rate

	Universities	Copies distributed	Copies retrieved	%
1.	Federal University of Technology, Minna, Niger State.	155	121	78
2.	University of Abuja, Abuja	111	86	74
3.	University of Jos, Jos.	168	130	77

4.	University of Ilorin, Ilorin.	123	96	78
5.	Nile University of Nigeria (NUN), Abuja.	7	5	71
6.	Prince Abubakar Audu University, Anyigba	45	35	77
7.	Benue State University, Makurdi	45	35	77
8.	Kwara State University, Malete	25	19	76
9.	Ibrahim Badamasi University, Lapai	12	9	75
10.	Nassarawa State University, Keffi	333	260	78
Total		**1024**	**796**	**78**

Source: Author's Field Work (2022)

Table 4.1 shows the copies of questionnaires distributed, returned and analysed. The following is the response: Federal University of Technology Minna (distributed = 155; returned = 121), the University of Abuja (distributed = 111; returned = 86), the University of Jos (distributed = 168; returned = 130), University of Ilorin (distributed = 123; returned = 96), Nile University of Nigeria Abuja (distributed = 7; returned = 5), Benue State University, Makurdi (distributed = 45; returned = 35), Kwara State University (shared = 25; returned = 19), Nasarawa State University (distributed = 333; returned = 260), Ibrahim Badamasi Babangida University Lapai (distributed = 12; returned = 9), Prince Abubakar Audu University, Anyigba (distributed = 45, returned = 34). The total number of copies of the questionnaire distributed was 1024, and a total of 796(78%) was the response rate.

4.5 Objective 1: Find out the type of research activities carried out by postgraduate students in universities in Nigeria.

Table 4.2: Type of Research Activities Carried Out by Postgraduate Students in Universities in North-Central, Nigeria (N=1024)

S/N	STATEMENT	SD 1	D 2	A 3	SA 4	N	FX	MEAN	ST. D	Decision
1.	Workshops	60	108	208	420	796	2580	2.84	1.15	Agreed
2.	Seminars	166	132	166	332	796	2256	2.86	1.19	Agreed
3.	Research Publications	184	130	162	320	796	2210	2.75	1.24	Disagreed
4.	Basic Research	132	172	178	314	796	2266	2.86	1.07	Agreed
5.	Publishing Research Findings	151	155	271	219	796	2150	2.84	1.11	Agreed
6.	Applied Research	120	184	179	313	796	2277	2.90	1.01	Agreed
7.	Symposiums.	144	160	179	313	796	2253	2.82	1.11	Agreed
8.	Interdisciplinary Research.	138	166	186	306	796	2252	2.82	1.08	Agreed
9.	Translational Research	156	154	180	306	796	2228	2.74	1.15	Disagreed

	Average Weighted Mean							**2.82**	**1.12**	

Key: SA = Strongly Agreed, A = Agreed, D= Disagreed, SD = Strongly Disagreed, StD = Standard Deviation and (Decision Mean = 2.82)

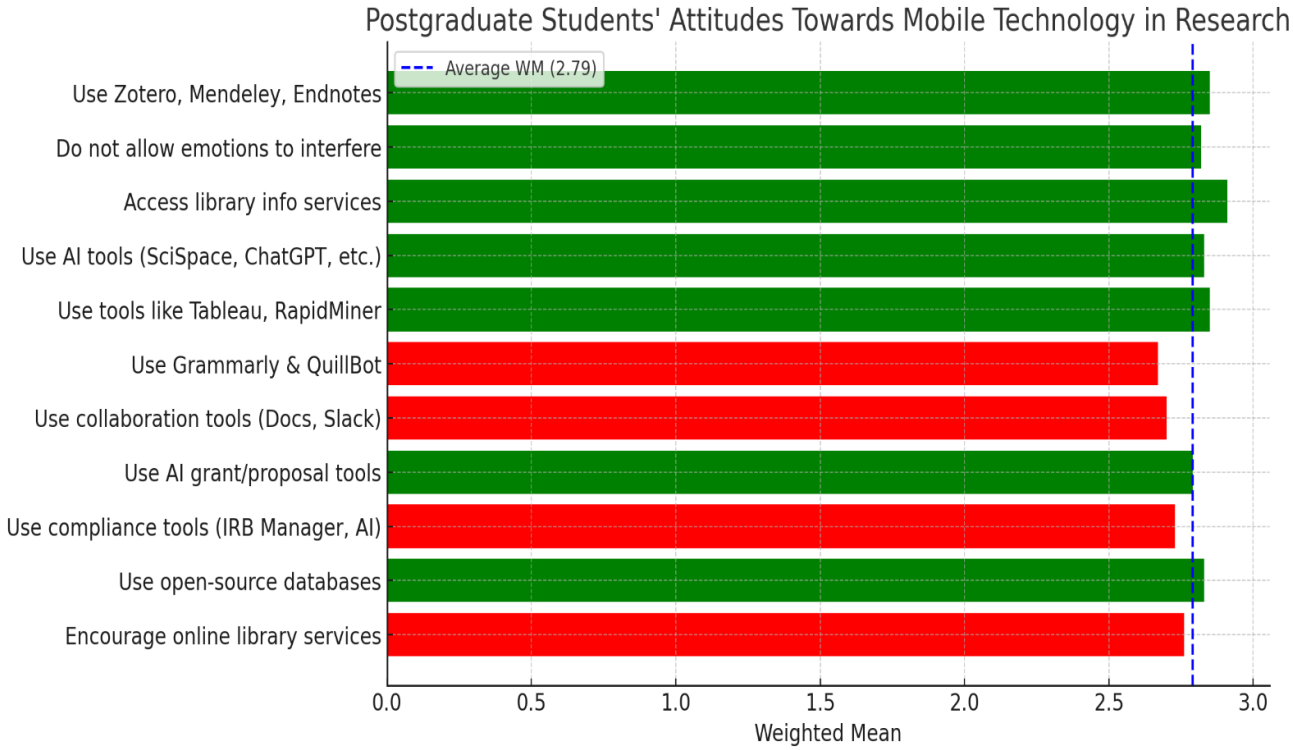
Source*:* Author's Fieldwork (2025)

Table 4.2 revealed the results of 796 respondents from the 10 universities selected for the study. The result showed the perceptions of postgraduate students on various research activities. A benchmark mean of 2.82 was used to classify activities into "Agreed" or "Disagreed." Similarly, Agreed Activities (Mean ≥ 2.82): Workshops (2.84), Seminars (2.86), Basic Research (2.86), Publishing Research Findings (2.84), Applied Research (2.90), Symposiums (2.82), and Interdisciplinary Research (2.82) are well-regarded, reflecting strong engagement and

relevance. While Disagreed Activities (Mean < 2.82): Research Publications (2.75), Translational Research (2.74), and Conferences (2.72) scored below the benchmark, suggesting challenges in these areas. With an average weighted mean of 2.82 and moderate variability (SD = 1.12), most activities are positively perceived, while a few, like research publications and conferences, require targeted improvements in universities in North-Central, Nigeria.

Research Question 2: Postgraduate students' attitude towards mobile technology devices in their research activities in universities in North-Central Nigeria

Chart 4.2: revealed the results of 796 respondents from the 10 universities selected for the study.



The result showed that respondents agreed with the positive statements of Postgraduate students' Attitude towards the use of mobile technology devices for their research activities in universities in North-Central Nigeria, with an average weighted mean score of 2.79 and an average standard deviation of 1.06. The items include Item 1. Postgraduate students have a positive attitude towards the use of mobile technology applications such as Zotero, Mendeley and Endnotes for reference citation and management. (mean = 2..85; StD = 1.09), Item 2: Postgraduate students do not allow their feelings and emotions to interfere with PG Students' research activities in terms of assisting using mobile technology devices (mean = 2.82; StD = 1.11). Item 3: Postgraduate students ensure that they have access to library information services that will aid their research activities more effectively. (mean = 2.91; StD = 0.96), Item 4: Postgraduate students use mobile technology devices and applications such as Sci Space, Chat GPT, Merlin and Semantic Scholars to ensure that they share information resources for literature reviews for the benefit of achieving their research activities. (mean = 2.83; StD = 1.15), Item 5: Postgraduate students ensure that they have mobile technology-enabled research tools such as Tableau and Rapid Miner for their data analysis (mean = 2.85; StD = 0.98). Item 6: Postgraduate students ensure that their feelings and thinking are in line with best practices in the use of mobile technology applications such as Grammarly and QuillBot in assisting PG Students in their writing. (Mean = 2.67; StD = 1.10), Item 7: Postgraduate students ensure that they use collaboration tools such as Google Docs and Slack in facilitating the research Activities of PG Students. (Mean = 2.70; StD = 1.05), Item 8: Postgraduate students also ensure that utilise Artificial Intelligence tools such as AI grant writers and Sci Note in facilitating the research activities of PG Students in the areas of writing grants and proposals (Mean = 2.79; StD = 1.14), Item 9: Postgraduate students use mobile technology device applications such as IRB Manager and Compliance AI to ensure that they comply with research ethics. (Mean = 2.73; StD = 0.98), Item 10: Postgraduate students with positive attitudes towards the use of mobile technology devices ensure that PG Students have access to open-source databases for research materials at no cost. (Mean = 2.83; StD = 1.12), and Item 11: Postgraduate students encourage the use of new technologies like mobile technology in supporting their research activities in terms of using online-based library information services. (Mean = 2.76; StD = 0.97). This implies that Postgraduate students have a highly positive attitude towards research activities in universities in North Central Nigeria.

Research Question 3: Information Provision for Research Activities of Postgraduate Students in Universities in North-Central Nigeria.

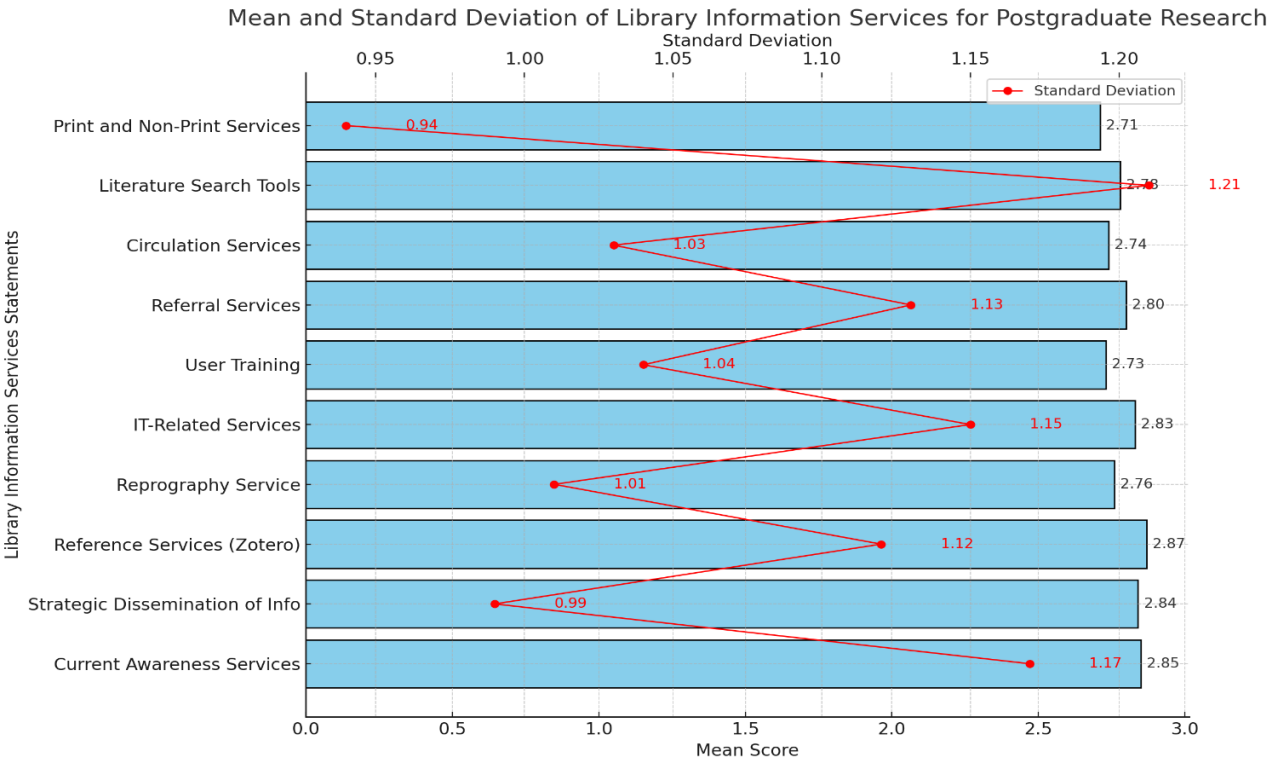


Chart 4.3: revealed the results of 796 respondents from the 10 universities selected for the study. The result showed that the provision of information services assisted the research activities of postgraduate students in universities in North-Central Nigeria with an average weighted mean score of 2.79 and an average standard deviation of 1.08. The items include Item 1: Current Awareness Services helps to provide the latest information for Postgraduate students' research (mean =2.85; StD = 1.17), Item 2: Selective dissemination of information has helped me greatly in finding the right resources for my research activities (mean = 2.84; StD = 0.99). Item: 3 Reference services have helped in making PG students' research activities easier (mean = 2.87; StD = 1.12), Item 4: Copies of relevant information resources through reprography to support their research has been made easier (mean = 2.76; StD = 1.01), Item 5: Information technology-related services have also helped in effective service provision for PG student's research activities (mean = 2.83; StD = 1.15), Item 6: User training has greatly influenced my information-searching skills positively (Mean = 2.73; StD = 1.04), Item 7: Referral services have a positive impact on my research activities (Mean = 2.80; StD = 1.13), Item 8: Circulation services played a vital role in research activities (Mean = 2.74; StD = 1.03), Item 9: Literature search has helped me in identifying gaps in knowledge (Mean = 2.78; StD = 1.21), and Item 10: Print and non-print services have made it possible for me to have access to e-books, e-journals etc. for my research writings (Mean = 2.71; StD = 0.94). This implies that the provision of information services was adequate for the research activities of postgraduate students in universities in North Central Nigeria.

Research Question 4: The extent of use of mobile technology devices for research activities of postgraduate students in universities in North-Central, Nigeria.

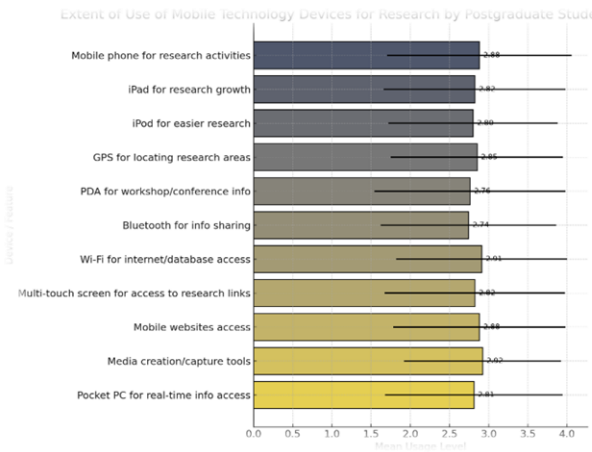

Chart 4.4. revealed the results of 796 respondents from the 10 universities selected for the study. The result showed the extent of the use of mobile technologies for research activities by postgraduate students. The extent of the use of mobile technology devices by postgraduate students' average weighted mean score is 2.83, and an average standard deviation of 1.12. The items include: Item 1: I used my mobile phone to help in my research activities (mean = 2.88; StD = 1.18), Item 2: I also use iPad to enhance my research growth (mean = 2.82; StD = 1.16), Item 3: The use of the iPod has made my research activities easier (mean = 2.80; StD = 1.08), Item 4: Global positioning systems (GPS) allow me to locate my areas of research activities using Google Maps on my phone (mean = 2.85; StD = 1.10), Item 5: The Personal Digital Assistant (PDA) allow me to have real-time information about workshops and conferences that will support (mean = 2.76; StD = 1.22), Item 6: Bluetooth makes it easier for me to retrieve both audio and video information from the mobile devices of my colleagues (Mean = 2.74; StD = 1.12), Item 7: Wireless Fidelity (Wi-Fi) helps me to connect m phone to the internet and another research database as fast as possible (Mean = 2.91; StD = 1.09), Item 8: the multi-touch screen allows me to easily access research links on my mobile phone (Mean = 2.82; StD = 1.15), Item 9: Using my mobile phone I can easily access mobile-enabled websites (Mean = 2.88; StD = 1.10), Item 10: Media creation and capture tools have been made easy when I use my mobile devices (Mean = 2.92; StD = 1.00)., and Item 11: The pocket personal computer allows me to have real-time access to essential information materials for my research (Mean = 2.81; St.D = 1.13). This implies that the extent of use of mobile technology devices is high among postgraduate students for research activities in Universities in North-Central Nigeria, with an average weighted mean of 2.86

4.5: Hypotheses

H_{03}: There is no significant composite effect of mobile technology devices, Postgraduate students' Attitudes and provision of information services on research activities of postgraduate students in universities in North-Central, Nigeria.

To test the hypothesis and analyse the data, multiple regression was used. A composite effect of mobile technology devices, Postgraduate students' Attitudes and provision of information services on research activities of postgraduate students in universities in Nigeria. The result of the analysis is presented in **Table 4.5:**

Table 4.5: Model summary of composite regression of Mobile Technology Devices, Postgraduate Student Attitudes and Information provision on Research Activities of Postgraduate Students in Universities in North-Central, Nigeria.

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.802*	0.643	0.642	0.41543

a. Predictors: (Constant): Mobile technology devices, postgraduate students' attitudes, information provision

b. Dependent Variable: Research activities

Table 4.5 showed the results of a multiple regression analysis examining how mobile technology devices, postgraduate students' attitudes, and the Information provision collectively influence the research activities of postgraduate students in universities in North-Central, Nigeria.

The R value (0.802) represents the overall strength of the relationship between the combined independent variables (mobile technology devices, postgraduate students' attitudes, and provision of information services) and the dependent variable (research activities of postgraduate students). An R-value of 0.802 indicates a strong positive relationship, meaning that these three factors together significantly contribute to postgraduate research activities.

The R-Square value (0.643) indicates that 64.3% of the variation in postgraduate students' research activities is explained by the combined effect of mobile technology devices, postgraduate students' attitudes, and information provision. This means that these two independent variables are major contributors to research activities, while the remaining 35.7% of the variance is due to other factors not included in this model. The Adjusted R-Square value (0.642) is very close to the R-Square value (0.643), indicating that the model is highly reliable and has minimal bias when applied to the population. The slight reduction from R-Square to Adjusted R-Square suggests that even if additional predictors were added, the model's predictive accuracy would not significantly decrease.

The Standard Error of the Estimate (0.41543) represents the average deviation of actual research activity scores from the predicted values. A lower standard error suggests that the model provides precise predictions, reinforcing the strong explanatory power of the independent variables in predicting postgraduate students' research activities.

The model shows that mobile technology devices, postgraduate students' attitudes, and the Information provision collectively have a strong and significant impact on postgraduate students' research activities. With an R-Square of 64.3%, the model suggests that these three factors are key determinants of research engagement among postgraduate students. However, since 35.7% of the variation remains unexplained, other factors such as academic motivation, research funding, internet access, and faculty mentorship may also play significant roles in influencing postgraduate research activities.

Table 4.6: ANOVA Model Composite Regression Analysis of Mobile Technology Devices, Postgraduate Student Attitudes and Information Provision on Research Activities of Postgraduate Students in Universities in North-Central, Nigeria.

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	315.310	3	105.103	869.134	.000[b]
	Residual	36.520	793	0.121		
	Total	351.830	796			

Dependent Variable: research activities

Predictors:(Constant): Mobile technology devices, postgraduate students' attitudes, provision of information services

Table 4.6. shows the composite effect of mobile technology devices, Postgraduate students' Attitudes and provision of information services on research activities of postgraduate students in universities in Nigeria. The table p-value = 0.000 infers the significant effect of the independent variables, mobile technology devices, Postgraduate students' Attitudes and provision of information services on research activities. Therefore, the null hypothesis, which stated that there is no significant composite effect of mobile technology devices, Postgraduate students' Attitudes and provision of information services on research activities of postgraduate students in universities in North-Central, Nigeria, is hereby rejected.

4.2. Discussion of the Findings

The types of research activities carried out by social science postgraduate students in universities in Nigeria are dissertation writing, attendance of workshops, seminars, symposiums for research purposes, and publications of research findings in reputable journals. The findings were supported by (Abu-helalah *et al.,* 2015; Beanland *et al.,* 2020; Borakati *et al.,* 2017; Kozlov *et al.,* 2017; Noguez & Neri, 2019; Razeghi, 2019; Roach, 2017; Swan *et al.,* 2018; Weiner & Watkinson, 2014). The authors asserted that research activities such as attending conferences, seminars, and workshops, and interacting with intellectuals in various fields of human endeavour, are key to innovation and academic publishing, especially among social science postgraduate students.

The results showed that postgraduate students' attitude towards the use of mobile technology devices for their research activities is quite encouraging and supportive. The findings further revealed that Postgraduate students ensure that postgraduate students have access to mobile technology-enabled research productivity tools such as Merlin and Semantic Scholar (Literature review), Tableau and RapidMiner (Data Analysis), Grammarly & QuillBot (Writing assistance), Google Doc and Slack (Collaboration tool), AI grant writers and EndNotes (Grant and Proposal writing), Mendeley, Zotero and EndNote (Reference Management), IRB Manager and Compliance AI (Research Ethics and Compliance) as well as Lab Archives and Any Logics (Experimentation and Simulations). This is because most Postgraduate students are tech-savvy and possess the right attitude in providing information resources geared towards aiding postgraduate students' research activities. Also, the generally positive attitude of Postgraduate students suggests a supportive environment for postgraduate students. Enhanced Postgraduate training on emerging technologies, as well as policies promoting best practices, could further bolster this support, making Postgraduate students even more effective facilitators of students' mobile-based research. The finding was supported by Larson (2019), who asserted that postgraduate students with positive attitudes are resourceful, confident, patient and humble in the way and manner they carry out their research activities using mobile technology devices. The author stated further that the benefits of Postgraduate students having a positive attitude could in the long run foster teamwork, solve problems, improve quality,

breed loyalty, reduce stress, and make for a pleasing personality, as well as make the environment congenial for the effective and efficient library information services that will aid effective, efficient and result oriented research activities through the use of mobile technology devices and its research productivity tools applications.

The study also confirmed that the following information services provisions, such as Strategic dissemination of information, reprography, reference services, circulation services, Current Awareness Services, user training, and print and non-print services, are the services provided by postgraduate students to positively influence the research activities of postgraduate students in universities in Nigeria. The result is that university libraries under study offer information services ranging from selective dissemination of information to user education programmes. This was supported by Saxena and Yadav (2013), who identified MMS and SMS notification services; library virtual/audio tours; Quick Response (QR) codes on mobiles; text reference services, mobile document supply; library guides; database browsing; e-resource with mobile interfaces; formal education, distance learning and e-learning as some of the library services that are provided to patrons via mobile technology.

The study further indicated that the extent of use of the available mobile technology devices by postgraduate students for research purposes in universities in Nigeria is high. Media creation and capture tools, Wireless Fidelity (Wi-Fi), mobile-enabled websites, mobile phones, Global positioning systems (GPS), and Bluetooth devices. This is so because most postgraduate students possess mobile technology devices with wireless fidelity, GPS, and Bluetooth enabled. Also, because of the functionality of mobile devices, postgraduate students use these devices for media creation, website and internet surfing, vis-à-vis research activities. The reason for this is that the significant use of mobile phones and tablets reflects the students' need for convenient, on-the-go research tools. This underscores the importance of maintaining reliable mobile-friendly resources and applications. Universities should focus on expanding digital resource accessibility, particularly for mobile platforms, and explore ways to incorporate other helpful mobile devices, like GPS and PDAs, into students' research routines. These findings were supported by Singh *et al.* (2020), who asserted that about two-thirds of the respondents (62.7%) owned internet-capable, handheld devices (including iPhone, Oreo, Blackberry, iPod touch, PDA, Pocket PC, etc.) and about half used the internet from their handheld devices daily. Social networking websites and text messaging were used by nine out of ten respondents (90.4% for social networking sites and 92.3% for texting), with a median frequency of daily use. The authors maintained that about three-quarters of the respondents (72.9%) used text messaging daily. This means that the extent of use of mobile technology devices is very high, which is in agreement with the present research.

There is a composite significant effect between mobile technology devices, provision of information services, and Postgraduate Students' Attitude research activities of postgraduate students in universities in North-Central, Nigeria. This can be seen by the patronage of the postgraduate to the research, and e-library sections of the university libraries for research activities, as university libraries provide wireless fidelity, technological devices and a responsive Postgraduate attitude. In the same vein, Anyim (2020) supported this assertion by examining electronic information resources for learning and research activities among undergraduate students in university libraries. The findings from Anyim (2020) revealed that online databases, search engines, World Wide Web (www), e-journals, e-books, and Online Public Access Catalogue (OPAC) were utilised. Also, the electronic information resources available in the library were used to a great extent for the research activities of the students.

5.0. Conclusion

The study highlights the Composite Effect of Attitude to Mobile Technology Devices and Information Provision as Correlates of Postgraduate Students' Research Activities in Universities in North-Central, Nigeria. Embracing mobile technology enhances accessibility, efficiency, and convenience in research activities. The study emphasises the importance of training Postgraduate students, fostering collaboration among stakeholders, addressing the digital divide, and continually adapting information services to align with postgraduate students' evolving needs. These insights aim to enrich academic experiences and research outcomes in universities in North-Central, Nigeria.

5.1. Recommendations

1. **There should be mobile-friendly resources and research tools that are optimised for devices that can facilitate seamless access to information on the go, since postgraduate students' research activities in universities in Nigeria include dissertation writing, attendance of workshops, seminars, symposiums for research purposes, and publications of research findings in a reputable journal.**
2. **Postgraduate students' Attitude towards postgraduate students' research activities through the use of mobile technology devices in the provision of information services is quite encouraging and supportive. However, there is a need for universities to advance the training and retraining of library staff to provide insights into changes over time as mobile technology devices continue to evolve.**
3. Postgraduate students are encouraged to adopt a user-centred approach in designing and delivering information services. Also, soliciting feedback from postgraduate students about their preferences and needs related to mobile technology can guide the development of more effective and relevant services.

4. The universities should create awareness campaigns to educate postgraduate students about the benefits of utilising mobile technology for their research activities.
5. Since there is a composite effect of mobile technology devices, Postgraduate students Attitudes and provision of information services on research activities of postgraduate students in universities in North-Central Nigeria, it is therefore recommended that the universities should make adequate budgetary provision annually for the purchase and upgrade of mobile technology devices as well as upskilling Postgraduate students to enable them to perform optimally in the way they provide information services for the benefit of the university and the postgraduate students.

ABSTRACT

Government ministry libraries play important role in supporting policy formulation and administrative decision-making in the public sector. In Imo State, however, the present situation of public and government ministry libraries show notable challenges affecting their effectiveness. Most libraries operate with inadequate funding, outdated information resources, poor infrastructure, limited application of information and communication Technology (ICT), and a shortage of professionally trained library personnel. Whereas the Public Service Rules (PSR) makes provision for libraries in government ministries to collate, organize and provide needed information resources for the smooth running of their parent bodies. Imo State has 33 functional government ministries. The study examined the state of government ministry libraries in Imo State. The objectives of the study was to assess the adequacy of library facilities and infrastructure, examine the availability and relevance of information resources, determine the extent of ICT application in library operations, evaluate the professional capacity of library staff and identify the major challenges confronting these libraries. The population of the study comprised of the librarians managing 33 government ministries libraries in Imo State. Description survey research design was used for this research. A well-structured questionnaire was used as instrument for data collection. Tables, frequencies and percentages was used to analyze the research questions. The researchers sought to evaluate the current state of the libraries with a view to ascertain what is on ground. It was found out that though the libraries had professionally qualified staff, the librarians were not exposed to trainings at workshops and seminars. They also lack knowledge of ICT applications. The libraries also suffered the challenge of inadequate funding. The authors proffered possible solutions for revitalizing the government ministry libraries in Imo State.

Keywords: Government Ministries, Information Services, ICT Application, Government Libraries, Imo State.

Introduction

Libraries are established in state government ministries to provide information resources that are required to facilitate informed policy decisions in ministries. Library is a collection of information resources either in print, non-print or both, which are organized for use by people who need them. Government ministries include ministries, departments and agencies that form executive structures responsible for delivering government services to the people. They are departments saddled with the responsibility of managing specific sectors of public administration. Examples of government ministries include but not limited to agriculture, health, education, finance, home affairs, defense, justice, industry, transportation, housing and urban planning, information, local government affairs, environment etc. Government ministries are designed to execute the policies and decisions of the government.

According to Oladapo (2011), the functions government ministries include:

1. Providing necessary input into the articulation of vision and strategy of the government
2. Provision of the appropriate mechanism for the translation of government vision into policy framework
3. Provision of appropriate machinery for the implementation of government policies and decisions;
4. Providing the appropriate structure and manpower for actualization of goals and objectives of the government.

In order for a government to function properly, ministries play specific roles in public administration. The roles will include; policy formulation and implementation involving developing sector specific policies and ensuring their implementation to improve public service delivery, preparing implementing and monitoring the annual budget for their respective sectors to facilitate development programs, monitoring and evaluation; evaluating the impact of government projects and conducting performance reviews of public institutions and advising the government on legislation within their portfolio and developing regulatory frameworks.

Libraries in government ministries are information resource centers situated in ministries, department and agencies. These libraries are also called special libraries or ministerial libraries. According to Ode and Omokaro in Nweke and Echezona (2020) Special libraries are those group of libraries essentially meant for research on a particular field of study and are patronized by specialists and researchers. Special libraries are usually attached as an aid to research in a particular subject area in establishments, organizations and government departments. Special libraries are libraries that are designed to collate, organize and disseminate specialized information resources that will serve the information needs of people with special interest. Given the reason that each ministry is focused on specific area of interest like health, education, agriculture etc., it is safe to regard libraries in the ministry as special. The resources are directed towards satisfying the need of the parent ministry and staff. These libraries are established to explore specialized information for the advantage of their parent organization which provide financial support to the libraries. Government ministry libraries can be classified as special libraries because the collection of each library is basically restricted to resources that support

the functions of the particular ministry. The library collection and access is structured to the interest of the parent ministry. Patronage is also usually staff of the ministry.

The primary essence of having libraries in situated within government offices is to serve as essential information resource centers for policy formulation, research and documentation within the federal and state agencies. The job of governance either at local government, state or federal government level is for policy decisions that affect the lives of people. These decisions are also based on defined policy framework. Decisions are guided by the law. While good decisions benefit the people, wrong or bad decisions can affect the masses negatively. Bad decisions can also influence the way the government is accepted by the people. It is therefore imperative that right decision are taken all the time. Policies of government are invariably implemented by civil servants in the various ministries, department and agencies.

According to Oyeniyi and Olaifa (2025) government policies are tools for national development in Nigeria. Good decisions can only be carried when the decision makers are well informed. The libraries in government ministries are there to provide all specialized information resources. Materials of government ministries include gazettes, laws, pronouncements, edicts, special files, etc. The materials of the ministry libraries are meant to guide decision making. Key examples include the Federal Ministry of Education Library Unit, the Office of the Secretary to the Government OSGF Library and Imo State Ministry of Justice Library. These libraries are primarily located in Abuja, the federal capital and state capitals.

These libraries are increasingly digitized, providing both physical and virtual information access to support research and public service. They are crucial for maintaining national intellectual heritage and providing timely information for government functions.

According to Igwe, Iwuagwu and Igwe (2018), government ministry libraries are established in ministries, departments and agencies to provide information resources in diverse formats for information services to support the programmes and objectives of government. These resources are expected to facilitate informed decision-making. They are crucial for maintaining national intellectual heritage and providing timely information for government functions. Types of publications available at the ministry of Justice library are gazettes, laws of the federal republic, parliamentary debates, annual reports / press releases, laws reports and Supreme Court judgments. (Okoro; 2025)

Government ministry libraries in Nigeria serve as essential information resources centers for policy formulation, research and documentation within federal and state agencies. Libraries and information centres as important agent for information dissemination have a vital role to play in the actualization and implementation of government policies. (Oyeniyi and Olaifa, (2025)

The ministry library is usually set up to act as a repository of all government publications concerning the ministry. Other resources in the library include relevant reference materials such as newspapers, magazines, research works and varied information resources in other fields of knowledge to facilitate the discharge of the duties of the ministry.

Ability of government ministry libraries in the state to provide optimal service which is basically to facilitate the work of the ministry, rests on a well-equipped library. The library must be stocked with relevant physical and electronic resources that can support research and public services.

It must have qualified personnel that are capable and competent with ICT skills to handle modern technologies. The library must also be equipped with relevant gadgets and facilities that will make the environment conducive and attractive to policy makers. Where these basic requirements are lacking or inadequate, the goal of facilitating policy decisions in the ministries becomes a mirage. Over the years, observations show that many government ministry libraries in Imo state have been operating below standard. Unfortunately, programs and activities of many government ministries in Imo State continue without input from their libraries. Libraries are not fully equipped, there is dearth of requisite information resources and their staff are not well trained with decline in funding. In fact Onuoha and Chukwueke (2025), assert that government owned libraries in Nigeria are nowhere to be ascribed to standard when compared to similar libraries in other parts of the world. The purpose of this research is to ascertain reasons for the unfavorable condition and why many government ministries in Imo state operate without functional libraries.

Objectives of the study

The specific objective of the study are;

1. To ascertain the adequacy of library facilities and infrastructure in government ministries in Imo State.
2. To examine the availability and relevance of information resources
3. To determine the extent of ICT application in library operations
4. Identify the professional capacity of library staff
5. Identify the major challenges confronting government ministry libraries

Literature Review

Availability and relevance of information resources

Information is a vital resource for problem solving and decision making. Information resources are print and non-print materials that a library provides to satisfy the research, information and decision-making needs of its clientele. According to Nweke and Echezona (2020) information resources could imply information materials acquired, processed

and organized for consultation and lending purpose. The availability and relevance of information resources in government libraries is paramount. Information resources in government ministry libraries include government publications like gazettes, white papers and policy documents, annual reports and budgets, reference materials like dictionaries, encyclopedia, directories, handbooks and manuals, current information materials like newspapers, magazines and professional journals. It also includes statistical and administrative records. These materials may be in paper form which is physical or in electronic format like e-books, online journals and databases or institutional repositories. In whatever form materials are, libraries and information centres are expected to provide them for information, education, research, current affairs, and reference services. Good information resources are characterized by relevance, currency, adequacy, accessibility and authority. The provision of relevant, and current information is an imperative for good policy formulation, and execution of policies. The information resources will support good decision-making, act as institutional repository and help staff in educational and professional development.

Ibenne, Amanze-Unagha and Udo (2018) opine that the type, quality, quantity and variety of information resources acquired in a special library depend on the nature of the users of the service, the operational environment in terms of resource availability and most importantly the adequacy of funding received by the library for its operations. Funding is a major yardstick that determines availability and relevance of information resources. Nweke and Echezona (2020) agree that lack of funds to acquire books and other information materials as well as run other library operations in ministry libraries has been identified as a barrier to successful provision of library services.

Professional Capacity of Library Staff

Professional capacity of library staff in government ministry libraries are the qualifications, skills and competences of the manpower in the libraries. The basic staff of libraries are librarians, library officers and information officers. According to Eyitayo in Daniel, Ifidon and Okegbola eds.(2012) A librarian is a skilled professional that requires a high standard of educational and professional training to be involved in book selection, reference services, readers advisory work, current awareness services, cataloguing and classification of library materials..

Aboyade, Madu and Aboyade (2016) human capacity building is the enhancement of the human factors that make efficient service delivery and user satisfaction. 21st century library and information professionals must of necessity possess a minimum of two sets of skills to function adequately in the new dispensation, namely, professional and personal competencies. Professional competencies will normally include the following;

i. the ability to use appropriate business and management approaches to communicate the modern language of information services to senior management

ii. ability to develop specialized information products for use within and outside the organization or by individual clients

iii. ability to evaluate the outcomes of information use and conduct research related to the solution of information management problems

iv. ability to continually improve information services in response to the changing needs

v. expert knowledge of the content of information resources, including the ability to critically evaluate and filter them

vi. possession of specialized subject knowledge appropriate to the business of the organization and its clientele

vii. ability to develop and manage suitable, accessible and cost effective information services aligned with the strategic directions of the parent organization

viii. ability to provide excellent instruction and support for library and information service users

ix. ability to assess information needs, designs and markets with value-added information services and products to meet identified needs of the organization

x. capability to apply appropriate information technologies to acquire, organize and disseminate information as at when required by management;

xi. having an eagle eye and in-depth ways to look at old problems and the ability to develop, adapt and implement new thinking that distinguishes him from peers and before the rest of the bunch.

Globalization, engendered by advances in ICTs has boosted library operations and services thereby making libraries to be more relevant as information professionals more than ever before. Possession of ICT skills has become an important recruitment variable foe librarians, while introduction of ICTs in education had also brought about computerization of traditional materials such as books, journals, newspapers and other information resources in the library (Madu, Aboyade and Aboyade (2016)

Extent of ICT Application in Library Operations

Access to modern information technology is currently one of the most attractive library services. ICT application to library services means the utilization of modern information technologies to acquire, process and make information available in the library. According to Blurtton in Eyitayo in Daniel, Ifidon and Okegbola (2012) ICT is defined as a diverse set of technological tools and resources used to communicate and create, disseminate, store and manage information. Information and communication Technology (ICT) in libraries act as a powerful catalyst for national; development by transforming traditional, physical repositories into digital hubs that provide efficient, fast access to

information. By accelerating knowledge sharing, education and research, these modernized services foster innovation, economic growth and social change

According to Eze and Uzuigwe (2012). Technology is driving change across the entire range of library responsibilities. Library services should be automated and provided through the use of ICTs to ensure maximum satisfaction of the information needs of the users of such services. Deployment of ICT in library operations facilitates better library service delivery.

Challenges of Government Ministry Libraries

Government ministry libraries in Nigeria have been challenged by various factors. Nweke and Echezona (2020) said that lack of finances can be seen as the most critical challenge facing special libraries in Nigeria, especially government ministry libraries. Funding continues to challenge most libraries. Government libraries are not exempted. This is also collaborated by Nkodo in Nweke and Echezona (2020) observed that special libraries have been seriously underfunded as there is no funding framework /model with clear emphasis on the funding of the libraries. In addition, Okoro (2025) asserts that factors militating against use of government publications in ministry libraries are obsolete materials, lack of proper organization, non-provision of computers and internet facilities, inadequate copies of relevant government publications, lack of reprographic services like photocopy, printing and inadequate funding of the library.

Libraries are often not seen as departments of paramount importance. Ayotunde in Nweke and Echezona (2020) also noted that special libraries around the world have experienced cuts in budget due to negligence from the parent body and government. He further asserted that parent bodies and government agencies have the belief that there are more important departments which require a larger percentage of allocation of funds than the library.

Research Methodology

The study was carried using descriptive survey. Questionnaire was employed for data collection in the existing 33 government ministries. The copies of questionnaire were analyzed using frequency counts ad percentages. Analyzed data are presented in tables.

Research Questions.

1. How adequate are library facilities and infrastructure in government ministries in Imo State.
2. How available and relevant are their information resources
3. What is the extent of ICT application in library operations
4. What is the professional capacity of library staff
5. What are the major challenges confronting these libraries

Findings and Analysis

The findings of the study are discussed under specific headings covering all the research questions.

Table 1.

Adequacy of library facilities and infrastructure in government ministries in Imo State.

Items	Strongly Agree	Agree	Disagree	Strongly Disagree
My library has adequate space to accommodate library users	5(15%)	18(55%)	10(30%)	
The library environment is conducive for reading and research		23 (70%)	5(15%)	5(15%)
The library has adequate shelves and storage facilities		15(45.5%)	15 (45.5%)	3(9%)
The library has reliable electricity supply	7(21.5%)	16(48.5%)	10(30%)	
Reading tables and chairs are sufficient for library users		6(18.5%)	17 (51.5%)	10 (30%)
The library is well maintained		8(24%)	22(67%)	3(9%)

Table 1. Shows the perception of respondents on the facilities of their libraries. While 15% strongly accept that the space is adequate, 55% agreed that the space is adequate. 70% unanimously agreed that the library environment was conducive for reading and research. However, 22(67%) and 17(51.5%) rejected that reading tables were sufficient or that the library was well maintained.

Table 2.

Available and Relevance are Information Resources

Items	Strongly Agree	Agree	Disagree	Strongly Disagree
The library has adequate print resources		10(30%)	14(43%)	9(27%)
Information resources are current and up-to-date		10(30%)	14(43%)	9(27%)
Government publications and policy documents are readily available		9(27%)	12 (36.5%)	12(36.5%)
Available resources are relevant to ministry's functions		20(61%)	8(24%)	5(15%)
Users are satisfied with available information resources		8(24%)	18(55%)	7 (21%)

The enquiry was to determine if information resources were available and relevant to the needs of library users.43% and 27% agreed that print resources were inadequate. 43% and 27% also agreed that information resources were neither current nor up to date. Only 24% agreed that users were satisfied with available information resources.

Table 3.

The extent of ICT application in library operation.

Items	Strongly Agree	Agree	Disagree	Strongly Disagree
There are enough computers for library operations		3(9%)	10(30%)	20(61%)
The library uses computers for cataloguing and classification		3(9%)	10(30%)	20(61%)
Internet services are available	2(6%)	3(9%)	10(30%)	18(55%)
The library uses automated library services		3(9%)	16(48.5%)	14(42.5%)
ICT is used for information retrieval	5(15%)	10(30%)	8(25%)	10(30%)
Staff are competent in the use of ICT tools	7(21%)	12(36.5%)	14(42.5%)	

To know the extent of ICT application, only 9% of respondents said they had enough computers. 9% said they used computers for cataloguing and classification while 48.5% and 42.5% disagreed that they use automated system for library services.

Table 4.

Professional Qualifications of staff

Highest Professional Qualification	Frequency	Percentage
National Diploma ND	-	-
Higher National Diploma HND (Library Science)	10	30%
Bachelor's Degree BLS /BLIS	20	61%
Master's Degree MLS /MLIS	3	9%

Data shows that 70% of staff have the basic professional requirement of BLS degree as prescribed by Librarians Registration Council of Nigeria. It shows that ministry libraries have qualified manpower.

Table 5.

Professional Capacity of Library Staff

Items	Strongly Agree	Agree	Disagree	Strongly Disagree
The library is staffed with qualified professional librarians	8(25%)	23(69%)	2(6%)	
Staff regularly attend workshops and training programmes		6(18%)	15(45.5%)	12(36.5%)
Staff possess adequate cataloguing and classification skills		20(61%)	10(30%)	3(9%)
There are enough staff to handle library operations effectively		24(73%)	9(27%)	
Staff are motivated to perform their duties efficiently	6(18%)	7(21%)	13(40%)	7(21%)

On the professional capacity of staff result shows that 25% and 69% of staff were professionally qualified as librarians. However, 45.5% and 36.5% did not regularly attend workshops or training. 40% and 21% said they were not sufficiently motivated to effectively perform their duties

Table 6.

Major challenges confronting government ministry libraries in Imo State

Items	Strongly Agree	Agree	Disagree	Strongly Disagree
Inadequate funding affects library operations	24(73%)	9(27%)		
Obsolete materials hinder effective service delivery	15(45.5%)	15(45.5%)	3(9%)	
There are few trained personnel in ICT	15(45.5%)	15(45.5%)		3(9%)
Inadequate ICT infrastructure limits library performance	19(57.5%)	14(42.5%)		
Poor maintenance culture affects library infrastructure	18(54.5%)	15(45.5%)		
Low awareness of library services reduces patronage	15(45.5%)	15(45.5%)		3(9%)
Lack of digital resources	9(27%)	24(73%)		
Poorly organized print resources	9(27%)	24(73%)		
Lack of collection development policy	24(73%)	9(27%)		
Lack of government support affects library development	19(57.5%)	14(42.5%)		

Result showed that almost all respondents agreed that they faced the challenges of inadequate funding, outdated materials, inadequate ICT infrastructure, lack of collection development policy and lack of government support with 57.5% and 42.5% respectively.

Discussion

Government ministry libraries are indispensable tools for the actualization of good governance. It is in agreement with this assertion that the Imo State Civil Service scheme created room for the establishment of library units in all ministries in the state. However, this libraries have not been performing effectively as result show that 70% of the information resources are neither current nor up to date. It is also not surprising that the libraries are not doing well because statistics reveal that only 9% of the respondents use computers in library operations. In the area of professionalism, the libraries have qualified staff with 70% of respondents possessing the minimum bachelors' degree in library science. However, these librarians suffer negligence in continuous professional development as only 18% accept that they are exposed to regular workshops and training.

The ministry libraries are not immune from the various challenges assailing most government owned libraries. Results show that the libraries under review, suffered a mirage of problems including, adequate funding, insufficient information resources and dearth of ICT facilities. This is in agreement with Kolajo and Olatoye (2025) stating that government libraries face the challenges of inadequate funding, inadequate and outdated stock, lack of staff motivation and inadequate ICT facilities. Regrettably, all respondents acknowledged lack of government support.

Conclusion and Recommendations

The study has revealed that libraries in government ministries though are existing, are only managing to survive. The Government can be commended for employing professional qualified librarians to run the various ministry libraries. Statistics showed that 54.5% of the workforce are between the ages of 40 and 50. The age bracket shows a young and energetic workforce. However these librarians have not been exposed to further training in workshops and seminars. The librarians also lack basic ICT skills needed to manage modern day libraries. The libraries are yet to adopt the use of ICT facilities in their library operations as revealed in Table 3. Results also show that the plague of inadequate funding that is ravaging many government owned libraries is also affecting ministry libraries. Lack of government support has deepened their problems as 100% of respondents agree that they do not experience government support in their libraries.

Library services are indispensable to the effectiveness and efficiency of government ministries. In order to make provide accurate, timely and relevant information for good policy formulation and implementation by government ministries, the following recommendations are made:

1. In order to fast-track an efficient information service delivery in government ministry libraries, funding should be adequate. It is not possible to provide special library service where financial resources are meager. Authorities are urged to make budgetary allocations to libraries and ensure release of allocated funds.
2. Though staff of the libraries have basic professional qualifications, they need trainings and retraining through workshops and seminars. They should be sponsored to attend workshops, conferences and seminars organized by Nigerian Library Association, Librarians' Registration Council of Nigeria and other profession enhancing organizations. Properly trained staff will definitely maintain and manage the libraries better.
3. Staff should be adequately trained in the use of ICT. Knowledge of ICT will enable staff to provide information in varied formats for the optimal satisfaction of their library users.
4. Automated library systems should be introduced into the operations of government ministry library. Information in print only, no longer suffices. It is therefore important to provide computers in the libraries and also automate some or all of their services.
5. Libraries in government ministries should adopt a standard library policy. Such policy will guide their operations and bring about standardization in the libraries.
6. Better government presence in the libraries is essential to boost staff morale. Long term negligence could lead to staff abandoning their duties. Government presence will encourage staff to perform optimally especially when their basic needs at work is provided.

Abstract

This paper explores the current situation of funding university libraries in Nigeria with their associated challenges, consequences, and strategies to over-come the situation. Mixed methods involving qualitative and quantitative research, literature survey, documentary method and citation analysis were adopted. Literature survey was adopted with the view of examining the various documentary sources and personal opinion pertinent to university library funding in Nigeria, African countries and outside world respectively. Google search was also adopted to harvest relevant sources. Results of literature survey shows that 44 literature/publications were cited to support argument raised at 63 frequencies (frequency counts) with African multidisciplinary journal as the most cited sources and results of the study contain issues surrounding the current situation of funding university libraries in Nigeria especially in the area of chronic under-funding, over-reliance on government subvention, ineffective utilization and non-implementation of research findings and panel recommendations, non-adoption of 10% budgetary allocation to university libraries, lack of autonomy, budget cut, and inadequate financial management. Funding sources include: subvention from Government, parent institutions, Tertiary Education Trust Fund (TETFund), internally - generated revenue (IGR) and fee–based services. The consequences of inadequate funding the university libraries are the over-reliance on outdated/poor and local collections, budget cut, non-implementation of policies, and low level of development and service delivery as well as low patronage on the part of clientele. In order to overcome the situation of chronic underfunding and its challenges, a number of strategies need to be put in place and they include: strict enforcement of 10% budget allocation to university libraries, adoption of acquisition method, pathway/diversification of funding sources, strategic partnership, Bring- Your-Own-Devices (BYOD) policies, fund-raising and donation, collaboration, lobbying, advocacy and efficient service delivery, among others.

Keywords: Challenges, Consequences, Funding, Nigeria, Strategies, University Libraries

Introduction

Education is the bedrock to national development in terms of social-economic, cultural, scientific and technological development and in fact an important social services and social subsection to the Growth Domestic Product (GDP). Every nation strives to provide education for its citizen. It is in line with this assertion that the 1999 Constitution of Federal Republic of Nigeria as amended in 2011 stress the importance of education to Nigerian child as it's relevant to country's economy. However, Federal Republic of Nigeria (2013) in its National Policy on Education emphasis government commitment to the Nigerian child's access to education that is relevant to the country's economy. The policy further structured Nigerian education system into four areas, thus: -

(a) Early Child Care and Development
(b) Basic Education (Pre-Primary, Primary and Junior Secondary Education)
(c) Post-Basic Secondary education (Senior Secondary and Technical Colleges)
(d) Tertiary Education (colleges of education, monotechnics polytechnics and universities).

Regardless of any system of education in operation in a country, the fundamental issue is its contribution to the entire nation especially in building human capital as this underscores the rationale behind countries making huge investments on education even through UNESCO maintain that member countries are expected to use 4 to 6% of their Gross Domestic Product (GDP) or 15 to 20% annual national budget to fund education (Chima and Yusuf 2023; leadership, 2025). Contrary to this benchmark, budgetary allocation to education by Federal, State, and Local Governments remains below the 15 – 20% of the total expenditure recommended by UNESCO. However, in 2022, 2023, 2024 and 2025, the federal budgetary allocation to education sector stood at 7.2 per cent, 7 per cent, 7.9 per cent and 7.3 per cent respectively. For the year 2026, the budget allocation to education sector stagnates at 6 – 7% (Tyohemba, 2025) even though it is far below the UNESCO standard despite the fact that Haruna and Suleiman (2020) maintain that budgetary allocation by local, state and federal government to education sector is inadequate and has affected infrastructural

development as well as non-payment of academic staff benefit as this situation usually lead to incessant strike action by trade unions within education sector. However, inadequate funding is not peculiar to universities, but also to entire higher educational institutions and research institutes which normally resulted to dispute between the trade unions and government, hence stakeholders blamed government on the acute insufficient funding to higher educational institutions including universities, thus inability to carry out research (Ayeni & Ayeni, 2023). Despite these shortcomings on funding education sector in Nigeria, some state government have made giant effort in making reasonable funding to education sector in their respective states, notably are: Kano state that allocated 30% of budget to education, and Edo state had increased monthly subvention from N100 million to N250 million to Edo State University, being a significant step toward revitalizing education sector as well as strengthen the capacity and improve learning condition respectively (Yakubu, 2026; Ochaga, 2026).

Table 1 and 2 show federal government budgetary allocation to education sector between fiscal years 2005 - 2012 and 2022 – 2026 respectively.

Table 1: Federal Government of Nigeria Budgetary Allocation to Education Sector (2005–2012)

Year	Total National Budget	Allocation to Education	% Share of Education
2005	1,846,000,000,000	92,000,000,000	4.98
2006	1,900,000,000,000	92,000,000,000	4.84
2007	2,300,000,000,000	186,000,000,000	8.09
2008	2,870,000,000,000	33,600,000,000	9.64
2009	3,101,813,750,626	216,639,437,111	6.98
2010	4,608,616,750,213	249,080,000,000	5.40
2011	4,226,191,559,255	339,481,528,685	8.03
2012	4,749,100,821,171	400,148,037,983	8.43

Table 2: Budgetary Allocation to Education Sector (2022-2026)

Year	Federal Budget ₦ (Trillion)	Allocation to Education Sector (Trillion)	Per cent (%)
2022	17.13 trillion	1.18 trillion	7.2 per cent
2023	21.83 Trillion	1.54 Trillion	7 per cent
2024	27.5 Trillion	2.18 Trillion	7.9 per cent
2025	54.99 Trillion	3.52 Trillion	7.3 per cent
2026	58.18 Trillion	3.52 Trillion	6. per cent

Source: Leadership Newspaper, Tuesday, December 30, 2025, p.4.

From Table 1 and 2 as contained in three different sources showed that Federal Government allocation to education sector is not adequate to provide education that would take Nigeria to next level hence Murtala and Durosaro (2022) reveal similar story in Table 2 as the budgetary allocation does not conform with the UNESCO standard despite Federal Government Policy Statement (2013) that it shall be committed to Nigerian child access to education that is relevant to country's economy.

The Federal Republic of Nigeria (2013) in its National Policy on Education section 5 subsection 80 maintain that tertiary education is system of education that is offered at Universities, Inter-university centres, colleges of education, monotechnics, polytechnics as well as specialized institutions like colleges of agriculture, schools of health and technology and national teachers institute (NTI). However, the concern of this paper is centered on Universities and University Library funding issues in Nigeria with respect to sources, challenges, consequences and strategies.

Even with the funding challenges to education sector in Nigeria, Government and Private organizations continue to establish universities i.e., the number of universities (federal, state and private) continue to increase on yearly basis, hence as at 5th January 2026, Nigeria has 309 universities with the breakdown of 74 Federal, 67 State and 168 Private universities respectively (NUC, 2026). The Table clearly show the breakdown even though federal universities are categorized as conventional, specialized and military respectively.

Table 3: Population of Universities in Nigeria as at January 5, 2026

Ownership	Number of Universities	Percentage (%)
Federal	74	24
State	67	22
Private	168	54
Total	309	100

Source: NUC, 2026

Universities are established to accomplish teaching, learning, research and community services even though their roles are for human capital development, research and innovation. Funds meant for the use by university library usually come through government subvention, or grant which are usually through National Universities Commission, State Ministry of Education and Proprietors respectively as case of federal, state and private universities.

Towards ending the 16-year dispute between Federal Government and Academic Staff Union of Universities (ASUU), there is hope for education sector especially the public universities in Nigeria such that the proposed funding would not only affect the welfare of academic staff but also the new "revamped university funding model with dedicated percentage allocations for research, libraries, laboratories, equipment and staff development" (Tyohemba, 2025), hence even with the available human resources and institutional facilities, without funding support, research cannot be carried out (Mohammed & Odunayo, 2023).

Based on the 1992 ASUU-Federal Government agreement, 10% of university's annual recurrent budget should be dedicated for university library services called Library Development Fund often used in the procurement of information resources, staff development, etc. This source of Library Development Fund comes from Government allocation. External agencies and private organisations can help fund university library services either in cash or in kind through donations from multinational companies, organisations and ICT from friends and philanthropists as well as complimenting the effort of government through foundation to education sector, hence federal government alone cannot finance education, (Bello & Abdulsalam 2021; Olusola, 2024).

Tertiary Education Trust Fund (TETFund) is an important supplementary source for public universities, colleges of education and polytechnics in Nigeria. This parastatal was created by Federal Government of Nigeria (Federal Ministry of Education) as part of 1992 FG and Academic Staff Union of Universities (ASUU) agreement that agency to supplement government source of funding public tertiary institutions be created/established, thus is a parastatal under Federal Ministry of Education was established and charged with the responsibility of providing funding assistance to public tertiary institutions (universities, colleges of education and polytechnics). The provision of assistance on funding public tertiary institution libraries is known as "Library Intervention" thus 2011, Act No. 7 stated that TETFund is to intervene only on public tertiary institutions which section 20 maintained "a university, a polytechnic or college of education". This act implies that companies, industries and enterprises are to pay 2% tax of their annual total earning and remitted to TETFund through Federal Inland Revenue Services (Abdullahi, Saka & Udoudoh, 2024). Although TETFund Intervention over the years have been used to construct classrooms, hostels, libraries and staff offices with emphasis placed on research capacity and digital integration in 2026 (Daily Trust, January 14, 2026).

To reduce over-dependence on government and proprietor's allocation and subvention to tertiary institutions and their libraries, there is the need for other sources of income generation as well as fee-based services to be explored, these as reported by Ishola (2014) include: binding, printing, registration, e-mail, reprographic, consultancy, rental facilities and services, among others. As for the university libraries, separate fund is usually set aside i.e running cost often called vote book or imprest. The office of the university librarian utilize this money to run the library, traveling, operating cost, maintenance of vehicles and facilities, purchase of printing book materials and stationaries. Typical university library vote book appears this format

Table 4: Imprest for XYZ Library

S/N	Title	Code	Amount₦ : K
1.	Transport and Traveling		3,000,000.00
2.	Printing and Stationery		1,000,000.00
3.	Operating Expenses		1,500,000.00
4.	Vehicle Maintenance		2,000,000.00
5.	Workshop Consumables (Bindery and Book Processing)		1,000,000,00
6.	Others (Please indicate)		Nil
7.	Maintenance of Minor Facilities		1,000,000.00
	Total		**9,500,000.00**

Source: Document search, 2026

Despite all these efforts made by both government and the authorities of tertiary institutions particularly university libraries, there are still hiccups to university library funding in Nigeria.

Statement of the Problem

University libraries are saddled with the responsibility of supporting the Universities core-mandate of teaching, learning, research and community services through the provision of information resources to support undergraduate and postgraduate teaching and researches among others. These functions can be effectively discharged if university libraries are adequately funded especially 10% that is expected to be allocated to university library services out of the entire universities' annual budget. Other sources of generating funds for university libraries are to be explored. It's unfortunately that Nigerian University libraries are facing funding challenges thus inability to deliver their services effectively. As a result of inadequate information resources couple with low users patronage which consequently lead to students attaining low academic performance resulting to inability to get better employment opportunities after graduation. (Abdullahi, Saka & Udoudoh, 2024). This study intends to examine and review relevant literature pertinent to university library funding in Nigeria thereby finding solutions to overcome challenges

Research questions

The study was designed to provide answers to the following research questions: -

1. What is the most cited sources of information as regards university library funding?
2. What are the funding challenges to university libraries in Nigeria?
3. What are the sources of funding university libraries in Nigeria?
4. What are the consequences of inadequate funding university libraries in Nigeria?
5. What are the strategies to overcome funding challenges to university libraries in Nigeria?

Literature Review

The related literatures are reviewed in line with the research questions and variables thus:

Considering the aspect of bibliometric analysis of journals of education and humanities as contain in the publication of the faculty of education and humanities, Federal University Gusau from 2016-2019, Chukwuji and Tsafe (2023) reported among others that books were the most cited/reference sources of information.

Funding Challenges

This challenge takes it source from government subvention or proprietor to universities as fund sent to universities are inadequate not to talk of the past sent to the university libraries. What is even released from the source as budget allocation to education sector doesn't align with the UNESCO recommendation not to talk of the 10% University's recurrent expenditure to university libraries. This is because this policy of 10% allocation to university libraries cannot be implemented due to the priority areas being focused by the institutional authorities as opposed to the university library development (Ishola, 2014; Awunandu, 2022) even though inadequate funding to academic libraries can affect both human and material resources (Onuoha and Chukwuemeka, 2025).

Budget cut is the reduction of the amount or percentage of budget by the institutional authorities which might be traced to lack of adequate funds, inflationary trends in the published materials, foreign exchange, priotize of items/programmes or lack of political will (Saka & Ladan, 2025).

The non-implementation of budgetary allocation to education can be attributed to lack of political will on the part of stakeholders in the education sector with little interest in reading, learning. Sometimes priority is accorded to non-education programmes as oppose to reading and library services. High cost of books, journals and ICT resources affect university library funding with high cost and inflation. With the high cost and inflation, the budgeted amount would be affected thus inability to meet-up with the realities of the 21st century librarianship. University libraries stocked the outdated collections, insufficient materials and inadequate ICT facilities. In fact, due to inadequate funding, university libraries rely mostly on the outdated resources and facilities and provison of insufficient service, google search, (Ishola 20214; Fajonyomi *et'al*, 2021; Chima & Yusuf, 2023).

Financial management is another challenge to funding Universities and possibly extend to university libraries as the case may be. According to Ibrahim (2024), the university financial management in Nigeria faces both internal and external challenges (inadequate funding couple with insufficient government allocation, poor-budgeting, limited financial autonomy as well as economic instability, regulatory framework, increased competition with limited resources were among challenges. Universities and university libraries lack full financial autonomy and hence over-reliance on government funding (Ibrahim, 2024).

Literature survey on role of libraries and information centres in Nigeria in digital age revealed that funding has being the major challenge or inhibiting factor in the effort of libraries in Nigeria to provide efficient services. Majority of

libraries in developing nations are experiencing inadequate funding resulting to stocking outdated collections: problem of adoption and sustainability of emerging technologist (Saka 2025); more so that private tertiary institutions of learning and public mono-techics in Nigeria do not benefit from any form of TETFund intervention as this situation negatively inhibit the development of libraries attached to those private institutions and public mono-technics (Saka & Ladan, 2025)

The research in Nigeria in most cases, in Art and Social Sciences are conducted for the award of certificates, diploma, and degree at the expense of implementing the research findings for national development. In most cases, the report of researches (theses and dissertations) usually ends-up on shelves in academic libraries for consultation but not for national development (Saka, Bida & Majison, 2015; Yakub, 2025). If the research outputs are fully implemented and actually put to use, they would project the image of the universities university libraries thereby attracting adequate funds for service delivery.

It's unfortunate that despite 1992 ASUU struggle and suggestion for the adoption and utilization of 10% university annual budget for university library development this has not seen the light of the day. In most public universities, the institutional management does not accord recognition to university libraries in this regard as priority is given to other projects in the university system as opposed to university library (Achebe 2012, Ishola 2014; Adetunda & Familusi, 2017).

Sources of funding

Murtala and Durosaro (2022) enumerates the sources of funding education in terms of financial provision for projects, services and business in the form of government grant, subsidy, donation, savings, tuition fees, levies and student loan to higher education even though it a clear fact that the major source of funding education is through government grant.

Abdullahi, Saka and Udoudoh (2024) to investigated the perception of undergraduate students on TETFund intervention in public university libraries in North-central, Nigeria with the adoption of survey design covering 166;026 undergraduate students in seven (7) selected universities in North-central, Nigeria used hypothetical approach of chi-square. The results showed significant association of TETFund intervention with information resource development, while there was no significant association of service provision with resource development and service provision respectively.

As rightly pointed out by Ilori and Onanuga, (2025), public library in Nigeria presently source funds through government subvention and grants as well as internally-generated revenue (IGR), such as photocopying services, rental of hall, library membership registration, printing services as well as organization of seminars and workshops couple with soliciting funds from wealthy individuals. University libraries in Nigeria are not far from generating income through the above-mentioned revenue streams even though Saka and Ladan (2025) outline various sources of funding university libraries such as government subvention, tertiary education fund (TETFund) as well as internally generated revenue including Library development levy or library registration, overdue charges, etc

However, some research institutes are university-based institutes and hence exhibit some features of university and so libraries are attached to them. Various funding sources exist to include subvention/budgetary allocation followed by donor, parent institution, research grant and internally- generated revenue (IGR) among others. Most of the funding sources are used for the acquisition of information resources; provision of services, maintenance of library materials and staff training among others (Saka, 2023). Akpena and Orahachi (2021) outline six sources of funding digital libraries thus includes international organizations, grants, government agencies, endowments, IGR and development partners.

Consequences of Inadequate Funding

The decline in funding universities has negatively affected university library development and service delivery. Since academic libraries play a central role in supporting teaching, learning, research and community services, inadequate funding has serious consequences on the overall development of the university system. Inadequate funding in the education sector, particularly in university libraries, has significantly affected infrastructural development and service effectiveness. Budget cuts often result in the delay of project execution and completion, poor maintenance of facilities, and limited expansion of library spaces. (Haruna & Suleiman, 2020; Saka & Ladan 2025).

Additionally, insufficient funding may lead to non-payment or irregular payment of staff salaries and benefits. This situation can trigger industrial actions by academic and non-academic staff unions, thereby disrupting academic activities and limiting access to library services. This situation can negatively affect student academic performance and hence serve as bottleneck in the labour market, (Abdullahi, Saka, Udoudoh, 2024 even though Onuoha and Chukwueke (2025) maintain that inadequate funding to academic libraries affect all the activities resulting to inadequate staff, resources, furniture, equipment and ICT infrastructure. In many developing countries, government funding for libraries remains inadequate, which further weakens their capacity to provide quality information services.

With persistent budget constraints, it becomes difficult to recruit and retain qualified professionals. Libraries may also struggle to acquire current academic materials and subscribe to essential electronic databases. As a result, users are forced to rely on outdated or insufficient resources, which negatively impacts research quality and academic performance (Abdullahi, Saka and Udoudoh, 2024). Due to inadequate funding, universities and university libraries may be compelled to implement budget cuts. This often involves reducing the percentage allocation to library within a fiscal year (Saka and Ladan, 2025) as such reductions can lead to non – subscription of physical and e-journals and databases respectively.

Inadequate funding significantly reduces opportunities for staff training and professional development in university libraries. Capacity building is essential for librarians to remain current with emerging trends, digital technologies, information management systems, and research support services. However, when funding is insufficient, universities are often unable to sponsor workshops, conferences, seminars, or advanced training programmes for library personnel. This lack of funded training opportunities limits skill acquisition, reduces staff efficiency, and ultimately affects the quality-of-service delivery (Awunandu, 2022).

Zero-base budgeting system is another challenge to university library funding and at the same time serve as negative effect of inadequate funding, Persistent inadequate funding may lead university libraries to operate under what can be described as "zero budgeting" or near-zero financial allocation. In such situation, once limited funds are exhausted, libraries are left with no financial resources to support ongoing operations while attitude of the management of research institutes, inadequate funding its self as well as the irregular release of funds and absence of budgetary allocation were discovered among challenges to funding research institute libraries in Nigeria. (Saka, 2023, Saka & Ladan, 2025;).

Inadequate funding to university libraries lead to stocking the outdated and irrelevant collections both (print and non-print) as subscription to electronic information resources becomes problem and consequently lead to failure in the professional and NUC accreditation and resource verification respectively, University libraries usually experience inadequate funding while accreditation is ongoing as this situation hinder acquisition of current information resources on regular basis (Fajonyomi, *et'al,* 2021: Oyetola, Adebayo and Onifade, 2025). Inadequate funding can also hinder the proper implementation of library policies and visitation panel's recommendations concerning university libraries. Even when policies exist to guide collection development, staff recruitment, ICT integration, and service delivery, financial constraints may hinder their full implementation. As reported by Musa and Saka (2025), inadequate institutional autonomy inhibits university libraries to act independently and effectively on the recommendations even though the top most challenge to the presidential visitation panel recommendations and implementation is funding to university libraries.

One of the major funding challenges to university libraries is the over-reliance on TETFund and government/university subventions. This over-dependence is often structured in such a way that university libraries are unable to explore or utilize alternative avenues to generate additional funds. As pointed out by Ibrahim (2024), "over-reliance on government funding" remains one of the internal challenges affecting university financial management in Nigeria.

Inadequate funding is not limited to universities and their libraries alone but also to entire higher institutions and research institutes in Nigeria such that the trade unions in education sector usually enter into dispute with government in the area of funding as stakeholders blamed government for under-funding higher educational institutions (Ayemi and Ayeni, 2023). Generally speaking, there is low priority to libraries in Nigeria especially with the depreciation of currency as a result of inflation which has affected library budget couple with exchange rate (Ilori and Onanuga, 2025).

Strategies to overcome funding challenges

Based on the identified challenges to funding; sources of funding which are inadequate, and consequences to inadequate funding to university libraries in Nigeria, the following strategies are suggested, enumerated and supported by literature survey:

Pathway for Nigerian Libraries.

The challenges of inadequate or poor funding from government and institutional management which sometimes are due to what Onuoha, David-West and Chuckuweke (2022) refer to as "poor economic state of nation" can be overcome through additional means of generating income by individual library, fee-based services, advocacy through sensitization and campaign as well as other means as these measures can help provide adequate funding to university libraries in Nigeria.

Pathway and Diversification of funding sources

University libraries in Nigeria should explore various sources of income generation or revenue streams especially provision of fee-based services such as registration, printing, binding, inter library loan, online, reprographic and e-mail services among others (Ishola, 2014). On the other hand, six concrete revenue diversification pathways which universities and university libraries in Nigeria can adopt according to Yahaya (2025) include: commercialization of research output, alumni endowment, philanthropy fund, public private partnership (PPP), professional and executive education (organizing short, certificate courses, online partnership with professional bodies), university holdings and investment vehicles, e.g. printing press, consultancy services etc. The sixth pathway according to Fajoyomi *et'al* (2021)

and Yahaya (2025) is the international grant and development partnership, actively pursued collaboration with global funding sources e.g Carnergie corporation.

Collection Development as Strategic option

University libraries can adopt acquisition method as strategy to overcome funding particularly in the area of building collections. The acquisition methods to be adopted by university libraries according to Issa (2023) include: purchase, gift and donations, exchange, library consortium and institutional membership.

Application of Collection Development policy through adequate funding:

This is another strategy by which adequate funding of university libraries in Nigeria can be ensured i.e provision of adequate funding so as to enhance the implementation of collection development policy of university libraries (Faga & Tsedoo, 2025). This means that with adequate funding to university libraries, there is tendency for effective implementation of collection development policies

Collaboration and Innovation

This is a strategy by which university libraries can adequately be funded and is through collaboration in general and research collaboration in particular i.e research collaboration among universities, industries' libraries and information centers (Ezekiel, 2022) thus research collaboration according to Hornby (2015) "is the act of working with another person or group of people" while collaboration can also occur among department of library and information science, industries, public private partnership, community, capacity building, research, teaching and professional networking. On the other hand, new ideas and discoveries in librarianship should be encouraged through research (Saka & Usman, 2025).

Bring -Your - Own -Devices (BYOD) Policies

This is another strategy whereby information technology (IT) policy, library staff and patrons are encouraged to use mobile phones and personal computers to access library's data, systems and databases in addition to those devices supply by the library. It has been observed that in academic libraries in Nigeria, library staff and users bring personal computers (PCs) and other IT devices to library so as to meet their information needs rather than waiting for the institution's management to supply those devices for them. Furthermore, academic libraries in Nigeria experience economic recession and inadequate budget and can be remedied through the strategy of by BYOD policy. (Onuoha and Chukwuemeka, 2025).

Lobby, advocacy and efficient service delivery;

Management of university libraries in Nigeria are expected to lobby and relate or establish relationship with the library committee members and the university governing council particularly council committee on university library services for effective efficient funding. The university librarian and other library staff should be engaged in the sensitization or exploring public awareness programs concerning the services offer by the university library as well as providing efficient services so as to win the confidence of the university management and or library committee for regular approval of library budget (Saka & Ladan, 2025; Ilori & Onanuga, 2025)

Fund raising and donation:

University libraries can organize launching i.e fund raising program this can also be related to the strategy employ by Ilori & Onanuga, (2025) concerning funding public libraries in Nigeria such that library staff can publish journal and present copies for launching and money realize could be used in providing various library services. On the other hand, the two co-authors suggested soliciting donation from private individual as well as contacting friend of library for financial assistance.

Compliance to 10% annual recurrent expenditure to university libraries

Heads of tertiary institutions particularly universities should be made to comply with the 10% of university annual budgetary allocation to university libraries and hence this should be enforced (https://www.google.com/serach?current.state.of.funding.university.libraries.in.nigeria). University libraries should be adequately funded to enable them acquire current information resources that align with standards for accreditation (Oyewole, 2019).

The uniqueness of this study lies on the fact that previous studies use singly research method and design while this study used both qualitative and quantitative research methods.

Methodology

Mixed method was used in this paper as the method involves qualitative research, literature survey, search, documentary and bibliometric analysis of cited papers, hence citation analysis was further conducted to assess the productivity of the publications being used in the write-up. The paper adopted documentary studies whereby relevant literature to university library funding are reviewed. (Akpena and Orahachi, 2021, Aina, 2024).

Literature survey was adopted for this paper as it involves harvesting, gathering sieving, sighting and reviewing relevant literatures pertinent to university library funding. The review was conducted in line with the five research questions and 44 relevant literature and sources were not only sighted at 63 frequencies but also reviewed mostly covering Nigeria

with focus on government publications, journals, conference proceedings, conference papers, a textbook, chapter in-book, reference source, newspapers, bulletin, as well as Google search. Narrations were used in the discussion of major findings thereby covering funding challenges and sources, consequences to under-funding in university libraries and strategies to overcome the identified challenges respectively. Findings from the literature survey in relation to the four research questions being identified, results and discussion follows.

Results and Discussion

From the literature survey and citations carried out, results are presented on Table 5 and the discussions made thereafter.

Table 5: Citation Analysis of Publications

Ranked Order	Cited Sources/Publications	Number of publications	Frequency	Percentage %

Source(s): Literature Survey/Cited Sources/Publications, 2026

Very interesting with the Table 5 is that the frequency counts (frequency of citations) are arranged by ranked order/descending order from highest to the lowest number(s) i.e from 6 (9.52%) to 1 (1.58%) respectively. Where there are two or more cited sources with the same frequency, letter-by- letter alphabetical filing system was adopted

It was discovered from Table 5 also that 44 different but relevant sources, (publications and google search) were cited at 63 times (frequencies) out of which African multidisciplinary journal of Kampala International University, Uganda being the only North African journal among the sighted sources with much published items on university library funding and at the same time conference proceedings of academic and research libraries section of the Nigerian Library Association as well as Annual Bursary Lecture in Federal University of Technology Minna respectively were the second in the ranking list. The reason for highest frequencies in the three cited sources/publications is not unconnected to the fact that multidisciplinary journal is being published by Kampala International University Uganda, while conference proceedings of the Academic and Research Libraries (ARL) section of Nigerian Library Association (NLA) consist of libraries situated in institutions of higher learning of which universities belong and that the theme of annual Bursary lecture was not only on funding and management of finance but also centered on universities in Nigeria with reference to funding and financial resource management respectively. Analysis discovered 19 publications with (1.64%) each being cited only one most of which are from journals, government publications (gazette, Nation Policy on Education, NUC Bulletin) as well as reference source (dictionary), workshop/conference paper and textbook respectively.

Discussion of major findings

Research question one find out the most cited sources of information in the literature survey concerning funding university libraries in Nigerian and it was discovered that African Multidisciplinary Journal of Development published by Kampala International University Uganda and this finding contradicts the findings by Chikwuji and Tsafe (2023) who reported books as the most cited sources of information.

In response to research question two on funding challenges as it affects university libraries in Nigeria, the literature survey discovered non-compliance to 10% budgetary allocation to public university libraries by the institutional authorities couple with inadequate funding, inflation, lack of autonomy as they align to the right-up of Saka & Ladan (2025), Ishiola (2014), and Achebe (2012) but contradicts the write-ups by Ibrahim (2024), Yahaya (2025) and Saka (2025) as the authors lay emphasis on challenges to funding Nigerian libraries and universities in Nigeria and not specifically on University libraries in Nigeria.

Research question three sought to review literature on sources of funding university libraries and the survey show that government subvention, TETFund Intervention and IGR were the sources outline by Saka and Ladan (2025), Abdullahi, Saka and Udoudoh (2024) but contradicts the write-ups by Akpena & Orahachi (2021), Saka (2023), Ilori and Onanuga (2025) respectively as the authors focus on funding digital libraries, funding public libraries and research institute libraries in Nigeria as opposed to funding university libraries in Nigeria respectively.

In response to research question four in line with the consequences of inadequate funding university libraries in Nigeria were examined through literature survey, search and areas identified to include: stocking outdated collection, zero-base budgeting, budget cut, negative effect on the overall development of university libraries, lack of policy implementation as well as limited training opportunities and decline in academic activities. All these consequences align with the write-ups by Awunandu (2022), Abdullahi, Saka and Udoudoh (2024), Saka and Ladan (2025), Unuoha and Chikwuemeka (2025), Oyetola, Adebayo and Onifade (2025), Musa and Saka (2025) respectively. The findings contradict the literature survey with respect to write-ups by Ibrahim (2024), Ayeni and Ayeni (2025), Yahaya (2025), Ilori and Onanuga (2025)

respectively as the authors delve into consequences of inadequate funding in terms of strike action by the trade unions in higher institutions of learning, foreign exchange and low priority to libraries generally in higher institutions in Nigeria as oppose to university library funding in Nigeria.

Strategies to overcome the challenges and consequence being the response to research question five were reviewed to include: university libraries to embark on adequate funding, adoption of acquisition methods Issa (2023) diversification of funding sources, pathway, fee-based services, collaboration and BYOD policies all align with Oyewole (2019), Onuoha, David-west and Chukwueke (2022), Ezekiel (2022), Saka and Ladan (2025) write-ups and google search but literature surveyed and reviewed showed partly align with fund-raising and donation, lobby and advocacy and BYOD policies by Ilori and Onanuga (2025) and Onuoha and Chikwuemeke (2025) as the authors delve more on funding public libraries and libraries in Nigeria without specific discussion on funding university libraries in Nigeria.

Conclusion

Functionality of university libraries in supporting the attainment of the core-mandate of universities is a function of adequate funding. Strategies to overcome the challenges must also align with the university library functions to support the overall mission or core-mandate of the university (teaching, research and community service). Since there is no university library or libraries that is self-sufficient in terms of resources, there is the need for collaboration and partnership among university libraries through consortium as well as collaboration with international donor agencies and industries.

Abstract

This study examined the relevance of Library and Information Science (LIS) curricula in library schools in South East Nigeria and the preparedness of graduates for contemporary information work. **Specifically, the study sought to: evaluate the relevance of current curricula to contemporary competencies; assess graduates' digital, technological, and user-centered skills; identify gaps between curriculum content and employer expectations; examine stakeholder perceptions of curriculum adequacy; and highlight challenges and strategies for aligning LIS education with modern information demands.** Anchored on Tyler's Curriculum Theory (1949), the research employed a survey design with a population of 127 respondents comprising 47 faculty members, 45 employers, and 35 LIS graduates. A total enumeration sampling technique was adopted, ensuring that all identified stakeholders participated. Data were collected using a structured Google Form questionnaire, which included closed-ended items on a four-points Likert scale and open-ended questions for qualitative insights. Quantitative data were analyzed using descriptive statistics (means, and standard deviations), with mean scores below 2.50 interpreted as disagreement and scores of 2.50 and above as agreement. Qualitative responses were analyzed using frequency counts and percentages to quantify recurring themes, thereby complementing the thematic insights. Findings revealed that although curricula reflect digital trends and balance theory with practice, they inadequately prepare graduates for modern roles, with digital and technological skill gaps most pronounced. The study recommended modernization, stronger industry collaboration, enhanced practical training, faculty development, and regular review to improve graduate employability.

Keywords: Curriculum relevance, Library and Information Science (LIS), Digital literacy, Graduate employability, South-East Nigeria

Introduction

In today's knowledge-driven economy, the relevance of Library and Information Science (LIS) curricula in preparing graduates for contemporary information work is increasingly critical. Traditionally, LIS education in Nigerian universities emphasized cataloguing, classification, reference services, serials management, and library administration (Abubakar, 2021). However, rapid advances in information technologies and changing user behaviours demand curricular reform to integrate digital literacy, knowledge management, data curation, and information architecture. The transformation of librarianship into a technology-enabled profession underscores the need to equip graduates with competencies for emerging information environments (Mubofu & Mambo, 2021).

A **curriculum** is the structured plan of learning experiences, objectives, and content designed to guide students toward acquiring knowledge, skills, and values. It provides direction for teaching and learning, establishes standards for evaluation, and ensures that learners are prepared not only for academic success but also for professional and civic responsibilities (Ochoma, 2020). **Curriculum relevance** refers to the extent to which curriculum content reflects real-world demands, technological advancements, and labour market expectations, thereby making learning meaningful and applicable to students' lives (Motsepe, Sethu, Sikhosana & Dladlama 2026).

Schools need curricula because they serve as the backbone of education, shaping instructional quality, student engagement, and employability outcomes. A relevant curriculum impacts schools by improving teaching effectiveness, impacts students by equipping them with competencies for lifelong learning and career readiness, and impacts the real world by producing graduates who can contribute effectively to national development and global competitiveness Abang (2025)

The issue of curriculum relevance and graduate employability is not peculiar to Nigeria or the South-East region; it is a global phenomenon. Studies from South Africa and Tanzania show that LIS graduates face similar challenges of limited digital readiness despite curricular reforms (Mubofu & Mambo, 2023; Sibiya & Ngulube, 2023). In advanced contexts such as the United States and Europe, curriculum reforms emphasize digital literacy, data curation, and user experience design to address evolving workplace needs (ALA, 2024; IFLA, 2023). Thus, the challenge of aligning curricula with employability is both evolving and universal.

Globally, efforts to improve curriculum relevance include regular curriculum reviews, integration of emerging technologies such as artificial intelligence and data analytics, and stronger collaboration between universities and industry (Olawunmi, 2025; Boyejo & Oke, 2025). Regionally, African scholars emphasize faculty capacity building and interdisciplinary approaches to strengthen LIS education (Awodoyin & Okiki, 2023). Locally, Nigerian reforms led by the Librarians' Registration Council of Nigeria (LRCN) have sought to modernize LIS curricula, though implementation remains slow (Okebukola, 2020; Ofor Douglas, 2024).

Despite these efforts, LIS graduates in South-East Nigeria continue to face displacement by IT specialists in digital roles, reflecting a mismatch between academic training and employer expectations. Employers consistently highlight deficiencies in software proficiency, digital resource management, and emerging areas such as information policy and knowledge management. Anchored on Tyler's Curriculum Theory (1949), this study assesses the relevance of LIS curricula in South-East Nigerian universities and examines the preparedness of graduates for contemporary information work. By situating Nigerian LIS curricula within global standards, the study aims to generate actionable recommendations for curriculum planners, educators, and policymakers to modernize LIS education, enhance graduate employability, and strengthen the contribution of information professionals to national development.

Statement of the Problem

Ideally, Library and Information Science (LIS) curricula in Nigerian universities should align with global standards such as those of IFLA and ALA, equipping graduates with both theoretical knowledge and practical competencies for contemporary information work. This would include digital literacy, data analytics, information architecture, user experience design, and knowledge management. In reality, LIS programmes in South-East Nigeria remain focused on traditional areas such as cataloguing and physical library management. Although the new Core Curriculum Minimum Academic Standards (CCMAS) introduced by the NUC aim to modernize programmes, implementation in LIS schools has been slow. Employers consistently report that graduates lack proficiency in software tools, digital resource management, and emerging areas such as information policy, leading to their displacement by IT specialists in digital roles.

The consequences are clear: outdated curricula, inadequate faculty capacity, and weak industry collaboration have widened the gap between academic training and labour market expectations. Graduates are underprepared for positions in digital libraries, archives, and corporate information centres, limiting their contribution to national development. Tyler's Curriculum Theory (1949) frames this problem by emphasizing that curricula should prepare learners for occupational roles and societal needs. The persistent misalignment between LIS curricula and employer expectations in South-East Nigeria reflects a failure to achieve these principles, underscoring the urgency of reform. Furthermore, stakeholder perceptions , including those of students, faculty, and employers, remain divided on the adequacy of LIS curricula in preparing graduates for professional practice in the digital age. Capturing these perspectives is essential to fully understand the scope of the problem and to design reforms that are both practical and inclusive.

Therefore, the central problem this study addresses is the misalignment between LIS curricula in South-East Nigerian universities and the competencies required for contemporary information work. Identifying curriculum shortcomings, evaluating the impact of CCMAS reforms, incorporating stakeholder perspectives, and aligning academic content with employer expectations are essential to improving graduate preparedness, employability, and professional performance

Research Objectives

The primary objective of this study is to assess the relevance of LIS curricula in universities in South-East Nigeria and determine the preparedness of their graduates for contemporary information work. Specifically, the study aims to:

1. Ascertain the relevance of the current curriculum of Library and Information Science schools in South-East Nigeria to the competencies required in contemporary information work.
2. To determine the extent to which LIS graduates from South-East Nigeria possess digital, technological, and user-centered skills demanded by today's information environment.
3. To identify the gaps between the curriculum content of LIS schools and the expectations of employers in libraries, archives, and other information sectors.

4. To ascertain the perception of stakeholders (students, faculty, and employers) on the adequacy of LIS curriculum in preparing graduates for professional practice in the digital age.
5. To identify the challenges that hinder the relevance of LIS curriculum in South-East Nigeria to contemporary information work.
6. To identify the strategies that LIS schools can adopt to align their curriculum more closely with the demands of the modern information environment.

Significance of the Study

This study is valuable to five stakeholder groups: curriculum planners, educators, administrators, students, and employers. For curriculum planners, it offers evidence-based insights to guide reforms that integrate technology and align outcomes with professional expectations. Educators will identify areas requiring further training to enhance graduate employability, while administrators and policymakers can use the findings to inform accreditation, resource allocation, and industry collaboration. Students will gain clearer understanding of employer expectations and the skills needed for contemporary information work. Employers, in turn, will see how collaboration with LIS schools can shape curricula that meet labour market demands. Overall, the study seeks to bridge the gap between academic preparation and professional practice, ensuring LIS graduates are better equipped for the digital information environment.

Literature Review

Curriculum Relevance in LIS Education

Curriculum relevance refers to the extent to which academic programmes reflect professional realities, technological advancements, and labour market needs (Egbosimba & Olusegun, 2025). Globally, LIS curricula have shifted from traditional emphases on cataloguing and classification to incorporate digital literacy, knowledge management, data curation, and user experience design. The American Library Association (ALA, 2024) and the International Federation of Library Associations (IFLA, 2023) highlight competencies in digital scholarship, data analytics, and information architecture as essential for modern practice.

In Africa, reforms have sought to integrate ICT and digital skills, but progress remains uneven. Studies from Tanzania and South Africa show that while curricula increasingly include digital competencies, graduates still face employability challenges due to gaps in practical readiness (Mubofu & Mambo, 2023; Sibiya & Ngulube, 2023). In Nigeria, LIS education has traditionally emphasized cataloguing, classification, and library administration, with limited integration of digital competencies (Abubakar, 2021). Despite reforms initiated by the Librarians' Registration Council of Nigeria (LRCN) and the introduction of the new **Core Curriculum Minimum Academic Standards (CCMAS)** by the National Universities Commission (NUC), curricula remain slow to adapt to technological change (Okebukola, 2020; Ofor Douglas, 2024). This raises questions about the relevance of current curricula to contemporary information work.

Graduate Skills and Preparedness

Graduate preparedness is a critical measure of curriculum effectiveness. Evidence shows that Nigerian LIS graduates often emerge with strong theoretical knowledge but limited exposure to practical digital tools. Kassim (2022) observed that graduates lack proficiency in software tools, data analytics, and information policy, making them less competitive in digital information roles. Employers increasingly replace LIS graduates with IT specialists in digital libraries, archives, and knowledge management units. Beyond technical skills, employability also requires soft skills such as adaptability, teamwork, and problem-solving. Boyejo and Oke (2025) emphasize that workplace readiness involves both technical and transferable skills, yet Nigerian LIS curricula remain weak in these areas. This deficiency undermines graduates' confidence and competence in modern information environments, highlighting the need for curricula that balance theory with practice and integrate digital competencies.

Curriculum–Employer Gaps

The gap between curriculum content and employer expectations is a recurring theme in LIS education. While curricula emphasize traditional library practices, employers demand digital literacy, information policy, and knowledge management skills. This mismatch has widened the gap between academic training and workplace realities, leaving graduates underprepared for professional practice in the digital age (Kassim, 2022; Boyejo & Oke, 2025). Employers often report dissatisfaction with graduates' ability to manage digital resources, use software tools, and adapt to emerging technologies. This disconnect reflects weak industry collaboration in curriculum design and limited consultation with employers during curriculum review processes. Addressing these gaps requires stronger partnerships between LIS schools and the information industry to ensure curricula align with workplace needs.

Stakeholder Perceptions

Stakeholder perspectives provide valuable insights into curriculum adequacy. Employers stress the need for digital literacy and soft skills such as communication and teamwork (Nwajiuba et al., 2020). Faculty members acknowledge the importance of reform but cite infrastructural limitations, shortage of digitally skilled staff, and slow policy implementation as barriers (Awodoyin & Okiki, 2023). Students express concern about employability and call for greater exposure to practical, technology-driven learning experiences (Oladapo, Olatunji, Salami & Oladapo, 2025).

These perceptions converge on the recognition that LIS curricula must evolve to meet the demands of the digital age. However, divergence also exists: while faculty may view curricula as adequate in theory, employers and students often highlight deficiencies in practice. Capturing these perspectives is essential to designing reforms that are inclusive and responsive to stakeholder needs.

Challenges Hindering Curriculum Relevance

Several challenges hinder curriculum relevance in Nigeria. These include outdated curricula that fail to integrate emerging technologies, inadequate faculty capacity to deliver modern content, weak industry collaboration, and slow implementation of CCMAS reforms (Okebukola, 2020; Ofor Douglas, 2024). Infrastructural limitations, such as poor access to ICT facilities and limited funding, further constrain effective curriculum delivery. These challenges explain why LIS graduates remain underprepared for positions in digital libraries, archives, and corporate information centres. They also highlight systemic issues in higher education governance, where policy reforms are often announced but not fully implemented.

Strategies for Curriculum Reform

Scholars propose multiple strategies to enhance curriculum relevance. These include regular review and updating of curricula, integration of emerging technologies such as artificial intelligence and the Internet of Things, stronger industry collaboration, and faculty capacity building (Olawunmi, 2025; Egbosimba & Olusegun, 2025). Interdisciplinary approaches and incorporation of transferable skills can further strengthen graduate preparedness.

Globally, LIS schools have adopted competency-based curricula that emphasize practical training, internships, and industry partnerships. Regionally, African scholars advocate for faculty development and infrastructural investment to support digital learning. Locally, Nigerian reforms led by the LRCN and NUC's CCMAS provide a framework for modernization, but success depends on effective implementation and stakeholder collaboration. Collectively, these strategies provide a roadmap for aligning LIS education in South-East Nigeria with global standards and preparing graduates for contemporary information work.

Theoretical Framework

This study is anchored on **Ralph W. Tyler's Curriculum Theory (1949)**, one of the most influential models in curriculum development. Tyler argued that curricula should not merely transmit knowledge but prepare learners for occupational roles and societal needs. His model is structured around four fundamental questions:

- **Objectives** – What educational purposes should the school seek to attain?
- **Learning Experiences** – What learning experiences can be provided to achieve these objectives?
- **Organization** – How can these experiences be effectively organized?
- **Evaluation** – How can we determine whether these objectives are being achieved?

This structure provides a systematic framework for curriculum design, implementation, and review. It emphasizes that curriculum must be dynamic, responsive to societal changes, and aligned with labour market needs.

Applied to **Library and Information Science (LIS) education in South-East Nigeria**, Tyler's framework highlights the need to balance theory with practice, integrate technological skills, and ensure curricula evolve with changing professional environments. If graduates are consistently underprepared for digital roles, it suggests failure in one or more of Tyler's four components: objectives may not reflect labour market demands, learning experiences may remain outdated, organization may not integrate practical exposure, and evaluation may not adequately measure workplace competencies. Importantly, this study does not simply benchmark South-East Nigerian curricula against Tyler's framework. Rather, Tyler's theory is used as a **diagnostic lens** to evaluate whether LIS curricula fulfill their intended purpose of preparing graduates for contemporary information work. The framework helps identify where gaps exist and guides recommendations for reform.

In Nigeria, LIS education is regulated by the **Librarians' Registration Council of Nigeria (LRCN)**, while the **National Universities Commission (NUC)** recently introduced the **Core Curriculum Minimum Academic Standards (CCMAS)** to modernize academic programmes. These developments provide a national context for curriculum reform. Tyler's framework complements CCMAS by offering a structured way to assess whether reforms are being implemented effectively and whether they address the misalignment between academic training and employer expectations. Thus, in this study, **curriculum relevance** serves as the central measure of how well LIS schools in South-East Nigeria fulfill their mandate of preparing graduates for effective participation in today's digital information environment. Tyler's theory provides both a conceptual foundation and a practical structure for evaluating curriculum adequacy, identifying shortcomings, and proposing strategies for alignment with global standards and national reforms.

Methodology

The study employed a survey research design to evaluate the relevance of Library and Information Science (LIS) curricula in South-East Nigerian universities and to assess graduate preparedness for contemporary information work. The population consisted of faculty members teaching in LIS schools, employers in libraries, archives, and corporate

information centres, and graduates of LIS programmes from the five federal universities in the region. These universities include the University of Nigeria, Nsukka; Nnamdi Azikiwe University, Awka; Michael Okpara University of Agriculture, Umudike; Federal University of Technology, Owerri; and Alex Ekwueme Federal University, Ndufu-Alike. In total, 127 respondents participated, comprising 47 faculty members, 45 employers, and 35 graduates. Each respondent was required to indicate their category in the questionnaire, which ensured accurate classification into the three groups.

A total enumeration sampling technique was adopted because the population was relatively small and accessible, allowing all identified stakeholders to be included. This ensured that the sample adequately represented the real population of interest within the defined scope of the study. To minimize social desirability bias, which is often inherent in survey studies, the questionnaire was administered electronically via Google Forms to guarantee anonymity. Respondents were assured of confidentiality and informed that their responses would be used strictly for academic purposes. Neutral wording was employed in the survey items to avoid leading questions, and the inclusion of both closed-ended and open-ended questions allowed respondents to provide candid views.

Data were collected using a structured questionnaire that combined closed-ended items on four-points Likert scale with open-ended items designed to elicit additional insights on outdated curriculum areas, skill gaps, and strategies for improvement. All responses were treated as survey data. Quantitative data were analyzed using descriptive statistics such as frequencies, percentages, means, and standard deviations, with mean scores below 2.50 interpreted as disagreement and scores of 2.50 or above as agreement. Qualitative responses (open ended questions) were analyzed using frequency counts and percentages to quantify recurring themes. This approach provided a comprehensive understanding of curriculum relevance, graduate preparedness, and stakeholder perceptions in South-East Nigeria.

Results

Table 1: Demographic Characteristics of Respondents (n = 127)

Stakeholder	Frequency	Percent
Faculty/Department	47	37.0
Employer	45	35.4
LIS Graduate	35	27.6
Total	127	100.0
Gender	Frequency	Percent
Male	65	51.2
Female	62	48.8
Total	127	100.0
Education	Frequency	Percent
Diploma	33	26.0
Bachelor's degree	32	25.2
Master's Degree	33	26.0
Doctorate	29	22.8
Total	127	100.0
Experience	Frequency	Percent
1-5 years	37	29.1
6-10 years	46	36.2
More than 10 years	44	34.6
Total	**127**	**100.0**

Respondents were fairly distributed: faculty (37.0%), employers (35.4%), and LIS graduates (27.6%). Gender was nearly balanced, with males (51.2%) and females (48.8%). Educational qualifications were evenly spread across diploma (26.0%), master's (26.0%), bachelor's (25.2%), and doctorate (22.8%). Most had 6–10 years of experience (36.2%), followed by over 10 years (34.6%) and 1–5 years (29.1%), reflecting a well-balanced and experienced sample.

Research Question 1: How relevant is the current curriculum of Library and Information Science schools in Southeast Nigeria to the competencies required in contemporary information work?

Table 2: Respondents' Perception of the Relevance of LIS Curriculum to Contemporary Information Work in Southeast Nigerian = 127(Faculty members, Employers and Graduates)

Item statement	SD	D	A	SA	Mean	SD*	Decision
The current LIS curriculum adequately prepares graduates for contemporary information work	33	37	32	25	2.39	1.08	Disagree
The curriculum reflects current trends in digital and technological skills.	32	27	37	31	2.53	1.12	Agree
The curriculum is regularly updated to meet changing industry needs.	31	28	35	33	2.55	1.13	Agree
The curriculum balances theory and practical training effectively	25	38	35	29	2.54	1.05	Agree
Overall Mean					**2.50**	**1.09**	**Agree**

In Table 2, the overall mean score of 2.50 (SD = 1.09) indicates agreement that the LIS curriculum is relevant to contemporary information work. Graduate preparedness recorded a mean of 2.39, SD = 1.08, reflecting disagreement. Other items—digital trends, curriculum updates, and balance of theory and practice—were rated agree (Means = 2.53, 2.55 and 2.54 respectively). Standard deviations (1.05–1.13) show moderate variability, suggesting mixed perceptions among respondents.

In your opinion, which areas of the curriculum are most outdated? (Open ended question as a follow up for Research question 1)

Table 3: Respondents' Opinions on the Most Outdated Areas of the LIS Curriculum

	Frequency	Percent
Digital Literacy & Skills	18	14.2
Traditional Library Practices	22	17.3
Teaching Pedagogy	9	7.1
ICT / Library Automation	35	27.6
Practical Training Component	18	14.2
Theory-Based Curriculum	9	7.1
Technological Skills Gap	8	6.3
Curriculum Structure Issues	8	6.3
Total	**127**	**100.0**

The findings show that ICT/Library Automation (27.6%) is the most outdated area, followed by Traditional Library Practices (17.3%), and both Digital Literacy & Skills (14.2%) and Practical Training (14.2%). This suggests that technological and practical components of the curriculum require significant improvement.

Research Question 2: To what extent do LIS graduates from Southeast Nigeria possess digital, technological, and user centered skills demanded by today's information environment?

Table 4: Extent to Which LIS Graduates Possess Required Digital, Technological, and User-Centered Skills n = 80 (Employers and Graduates)

Item statement	SD	D	A	SA	Mean	SD*	Decision
LIS graduates possess sufficient digital literacy skills.	30	11	19	20	2.36	1.22	Disagree
LIS graduates are well-trained in user-centered service delivery	15	13	30	21	2.72	1.05	Agree

LIS graduates demonstrate strong technological competencies	51	10	11	8	1.70	1.04	Disagree
LIS graduates are adaptable to emerging technologies and tools.	48	17	12	3	1.63	0.87	Disagree
Overall Mean					**2.10**	**1.05**	**Disagree**

The overall mean of 2.10 (SD = 1.05) in table 4 shows respondents generally disagree that LIS graduates possess required digital and technological skills. Digital literacy, technological competencies, and adaptability all scored below 2.40, reflecting notable gaps, while only user-centered service delivery (Mean = 2.72) was rated agree. Overall findings highlight critical skill deficiencies in today's information environment.

What specific skills do you think LIS graduates lack? (Open ended question as a follow up for Research question 2)

Table 5: Respondents' views on Skills Lacking Among LIS Graduates

	Frequency	**Percent**
Digital Skills	48	60
Information Literacy Skills	7	8.75
Information Retrieval Skills	5	6.25
Technology/ICT Skills	11	13.75
Data & Systems Skills	3	3.75
Software Development Skills	2	2.5
Practical Skills	2	2.5
Learning Skills	1	1.25
Computer Skills	1	1.25
Total	**80**	**100.0**

In Table 5 digital skills (60%) were the most lacking among LIS graduates, followed by technology/ICT skills (13.75%). Other areas such as information retrieval skills, software development skills, practical skills, and technical competencies recorded lower frequencies. Overall, the major deficiencies lie in digital and technological domains essential for effective performance in modern information environments.

Research Question 3: What gaps exist between the curriculum content of LIS schools and the expectations of employers in libraries, archives, and other information sectors?

Table 6: Perceived Gaps between LIS Curriculum Content and Employers' Expectations

n = 45 (Employers)

Item statement	SD	D	A	SA	Mean	SD*	Decision
The curriculum content matches the expectations of employers in libraries, archives, and other information sectors.	2	4	10	29	3.47	0.83	Agree
Employers find LIS graduates adequately prepared for professional practice.	15	8	2	20	2.60	1.34	Agree
The curriculum includes sufficient practical training and internships.	19	2	1	23	2.62	1.45	Agree
Employers are regularly consulted in curriculum development	2	1	10	32	1.49	0.85	Disagree
Overall Mean					**2.55**	**1.12**	**Agree**

The results in Table 6 suggest that employers generally perceive the LIS curriculum in South East Nigeria as aligning with their expectations, with a high mean score (3.47) indicating agreement that curriculum content broadly matches workplace needs. Employers also agreed, though less strongly, that the curriculum provides sufficient practical training and internships (Mean = 2.62) and that graduates are adequately prepared for professional practice (Mean = 2.60). The finding suggests that while curricula show some alignment, gaps persist in practice and readiness.

What gaps do you observe between curriculum content and workplace needs? (Open ended question as a follow up for Research Question 1)

Table 7: Identified Gaps between Curriculum Content and Workplace Needs

	Frequency	Percent
Lack of Practical Skills	23	51.1
ICT/Digital Skills Gap	5	11.1
Curriculum–Industry Mismatch	5	11.1
Weak Industry/Employer Link	7	15.5
Poor Curriculum Design	1	2.2
Communication Skills Gap	1	2.2
Problem-Solving Skills Gap	1	2.2
Professional/Service Skills Gap	1	2,2
UX & Community Engagement Gap	1	2.2
Total	**45**	**100.0**

The results show that lack of practical skills (51.1%) is the most significant gap, followed by weak industry/employer link (15.5%). Other gaps such as professional skills, ICT skills, and curriculum mismatch were less prominent. Overall, the major disconnect lies in insufficient practical exposure and weak collaboration with industry, limiting graduate readiness

Research Question 4: How do stakeholders - students, faculties, and employers, perceive the adequacy of LIS curricula in preparing graduates for professional practice in the digital age?

Table 8: Stakeholders' Perception of the Adequacy of LIS Curriculum for Digital-Age Professional Practice n = 127(Employers, Graduates and Faculty)

Item statement	SD	D	A	SA	Mean	SD*	Decision
Students feel confident that the curriculum prepares them for digital-age information work.	30	28	30	39	2.61	1.155	Agree
Faculty believes the curriculum is up-to-date with industry demands.	33	28	29	37	2.55	1.166	Agree
Employers are satisfied with the competencies of LIS graduates	33	31	28	35	2.51	1.154	Agree
Stakeholders believe LIS curricula foster innovation and problem-solving skills.	35	25	34	33	2.51	1.154	Agree
Overall Mean					**2.55**	**1.16**	**Agree**

In Table 8, the overall mean of 2.55 (SD = 1.16) indicates general agreement that the LIS curriculum is adequate for preparing graduates in the digital age. Student confidence (Mean = 2.61), faculty perception (2.55), employer satisfaction (2.51), and innovation/problem-solving skills (2.51) were all rated agree. Standard deviations (1.15–1.17) show moderate variation in responses. Overall, perceptions are positive, though moderate mean scores suggest room for improvement.

How would you rate the overall adequacy of LIS curricula in preparing graduates? (Open ended question as a follow up for Research question 4)

Table 9: Respondents' Rating of the Overall Adequacy of LIS Curriculum

	Frequency	Percent
Very inadequate	31	24.4
Inadequate	23	18.1

Neutral / Fairly adequate	24	18.9
Adequate	23	18.1
Very adequate	26	20.5
Total	127	100.0

The findings show mixed perceptions of curriculum adequacy. While 20.5% rated it as very adequate and 18.1% as adequate, a larger proportion (24.4% very inadequate and 18.1% inadequate) expressed negative views. This suggests that despite general agreement in earlier items, a significant number of respondents still perceive the curriculum as insufficient in preparing graduates for professional practice.

Research Question 5: What challenges hinder the relevance of LIS curricula in Southeast Nigeria to contemporary information work?

Table 10: Challenges Hindering the Relevance of LIS Curriculum to Contemporary Information Work n = 127(Employer, Graduates and Faculty)

Item statement	SD	D	A	SA	Mean	SD*	Decision
Limited resources hinder the relevance of LIS curricula	33	29	35	30	2.49	1.119	Disagree
Faculty training and exposure to new technologies are insufficient	30	32	33	32	2.53	1.111	Agree
Institutional policies restrict curriculum innovation	33	34	34	26	2.42	1.087	Disagree
Students face challenges accessing modern learning tools and facilities.	31	36	32	28	2.45	1.089	Disagree
Overall Mean					**2.47**	**1.10**	**Disagree**

The overall mean of 2.47 (SD = 1.10) in table 10 shows general disagreement that most factors hinder curriculum relevance. Only faculty training and exposure to new technologies (Mean = 2.53) was rated agree, while limited resources, policies, and access to tools were rated disagree. Overall, inadequate faculty training emerges as the most significant constraint, with other challenges less strongly perceived.

What other challenges affect LIS curriculum relevance?(Open ended question as a follow up for research question 5)

Table 11: Other Challenges Affecting LIS Curriculum Relevance

	Frequency	Percent
Inadequate ICT Infrastructure	12	9.4
Rapid Technological Change	52	40.9
Lack of Practical Training	17	13.4
Poor Policy/Institutional Support	12	9.4
Outdated Curriculum	9	7.1
Power Supply Issues	10	7.9
Information Literacy Challenges	8	6.3
Staff Training/Development Gap	7	5.5
Total	**127**	**100.0**

The results show rapid technological change (40.9%) as the most significant challenge to curriculum relevance, followed by lack of practical training (13.4%). Other issues such as ICT infrastructure, policy support, and power supply were less prominent. Overall, fast technological advancement and insufficient practical exposure are the major constraints to maintaining relevant LIS curricula.

Research Question 6: What strategies can be adopted by LIS schools to align their curricula more closely with the demands of the modern information environment?

Table 12: Strategies for Aligning LIS Curriculum with Modern Information Environment Demands n = 127 (Employer, Graduates and Faculty)

Item statement	SD	D	A	SA	Mean	SD*	Decision
LIS schools should integrate more digital and technological courses.	33	24	34	36	2.57	1.158	Agree
Stronger collaboration with employers is needed to update curricula.	28	27	36	36	2.63	1.118	Agree
Continuous professional development for faculty is essential	38	29	28	32	2.43	1.165	Disagree
Greater emphasis should be placed on practical training and internships	27	35	35	30	2.54	1.075	Agree
Overall Mean					**2.54**	**1.13**	**Agree**

The overall mean of 2.54 (SD = 1.13) indicates general agreement on strategies to align LIS curricula with modern demands. Respondents supported employer collaboration (2.63), integrating digital courses (Mean = 2.57), and practical training (2.54), while faculty development (2.43) was rated disagree. In a nutshell, findings emphasize modernization, industry collaboration, and practical exposure as key strategies.

What strategies would you recommend for improving LIS curricula? (Open ended question as a follow up for research question 6)

Table 13: Recommended Strategies for Improving LIS Curriculum

	Frequency	Percent
E-learning & Digital Learning Integration	12	9.4
Practical Training & Internships	56	44.1
Curriculum Review & Update	16	12.6
Industry Collaboration/Partnership	10	7.9
Funding & Financial Support	9	7.1
ICT Facilities Provision	9	7.1
Staff/Technology Training	8	6.3
Teaching Information Literacy	7	5.5
Total	**127**	**100.0**

In Table 13 practical training and internships (44.1%) were the most recommended strategy, followed by curriculum review and update (12.6%) and e-learning integration (9.4%). Other strategies such as industry collaboration, funding, and ICT provision were less prominent. Overall, enhancing practical exposure and regularly updating curricula are the most critical steps for improving LIS education relevance.

Discussion of findings

The findings indicate that although the LIS curriculum in South East Nigeria is generally regarded as relevant, significant concerns persist regarding the readiness of graduates for professional practice. The overall mean score of 2.50 suggests broad agreement that the curriculum incorporates digital trends, is regularly updated, and maintains a balance between theoretical knowledge and practical application. Nevertheless, the lower preparedness score (Mean = 2.39) highlights that graduates are not adequately equipped for contemporary roles in the information sector. This outcome aligns with Abubakar's (2021) argument that LIS education in Nigeria has historically placed greater emphasis on cataloguing and traditional practices, while insufficient attention has been given to developing digital competencies required in today's workplace. In line with Tyler's Curriculum Theory, the results suggest LIS schools fall short of meeting occupational outcomes.

The identification of ICT and library automation as the most outdated area, followed by traditional library practices, highlights the persistence of outdated content. This aligns with Okebukola's (2020) argument that LIS curricula in Nigeria remain slow to adapt to technological change. Similarly, Ofor-Douglas (2024) noted that the shortage of digitally skilled faculty hinders effective delivery of modern content. The respondents' emphasis on outdated technological and practical components reinforces the need for curriculum reform that integrates emerging technologies and experiential learning, as recommended by Olawunmi (2025).

Graduate skill gaps were another critical finding. Respondents disagreed that LIS graduates possess sufficient digital literacy, technological competencies or adaptability to emerging tools. Only user-centered service delivery was rated positively (Mean = 2.72). This supports Kassim's (2022) view that LIS graduates often lack proficiency in critical software tools, data analytics, and information policy, making them less competitive in digital information roles. Boyejo and Oke (2025) further emphasized that workplace readiness requires not only technical skills but also adaptability and problem-solving—areas where Nigerian LIS curricula remain weak. The survey findings confirm these scholarly concerns, showing that digital(60%) and technological skills (13.75%) are the most lacking among graduates.

Employer perspectives also revealed a disconnect between curriculum content and workplace needs. The most significant gap identified was lack of practical skills (51.1%), followed by weak industry linkages (15.5%). This finding resonates with Sibiya and Ngulube's (2023) study in South Africa, which highlighted employability challenges due to limited practical readiness, and with Awodoyin and Okiki's (2023) observation that infrastructural limitations and weak industry collaboration hinder curriculum reform in Nigeria. Tyler's framework emphasizes that learning experiences should be closely aligned with occupational roles. In light of this, the findings suggest that LIS schools in South East Nigeria need to strengthen their collaboration with employers. Such partnerships would help ensure that curricula remain responsive to workplace realities, equipping graduates with the competencies required for evolving professional demands.

Stakeholder perceptions were moderately positive, with students, faculty, and employers agreeing that the curriculum is adequate for digital-age practice. Yet, mixed ratings of overall adequacy (24.4% very inadequate, 18.1% inadequate, versus 20.5% very adequate) reveal lingering dissatisfaction. This reflects Nwajiuba et al.'s (2020) emphasis on employer demand for digital literacy and soft skills, which are not yet fully, embedded in LIS curricula. The findings also highlight rapid technological change (40.9%) and lack of practical training (13.4%) as major challenges, consistent with Mubofu and Mambo's (2023) observation that curricula across Africa struggle to keep pace with digital scholarship.

Findings reveal that rapid technological change (40.9%) is perceived as the most significant challenge to curriculum relevance in LIS schools in South East Nigeria. This reflects the reality that information environments are evolving faster than curricula can adapt, leaving graduates underprepared for emerging roles in digital libraries, archives, and corporate information centres. This aligns with broader scholarship. Okebukola (2020) emphasized that Nigerian higher education curricula often lag behind technological advancements, resulting in graduates who lack contemporary digital competencies.

Finally, respondents recommended strategies such as integrating more digital courses, strengthening collaboration with employers, and enhancing practical training and internships. Practical exposure was emphasized as the most critical reform strategy (44.1%), echoing Olawunmi's (2025) call for regular curriculum review and industry collaboration, and Egbosimba and Olusegun's (2025) emphasis on faculty capacity building. These recommendations are consistent with Tyler's Curriculum Theory, which emphasizes that curricula must remain dynamic and responsive to broader societal and technological transformations. According to this framework, the effectiveness of any curriculum is judged not only by its content but also by its capacity to prepare learners for meaningful and effective professional performance. In this context, the study's recommendations highlight the need for LIS programs to continually adapt and evaluate the curriculum content and delivery to ensure graduates are equipped with the competencies required in today's rapidly evolving information environment.

Conclusion

The study has shown that while LIS curricula in South-East Nigeria are perceived as moderately relevant to contemporary information work, they remain insufficient in adequately preparing graduates for digital-age professional practice. Outdated content, weak practical training, and gaps in digital and technological skills continue to limit graduate employability. Anchored on Tyler's Curriculum Theory, the findings underscore the principle that curricula should remain dynamic, evolving in response to societal and technological transformations. This perspective highlights the importance of continuous evaluation, ensuring that educational programs are not only theoretically sound but also aligned with occupational outcomes. In the case of LIS education, this means regularly assessing whether the curriculum equips graduates with the competencies required to meet the demands of contemporary information environments and professional practice.

Recommendations

1. LIS curricula should be updated to integrate emerging technologies such as data analytics, artificial intelligence, and digital content curation. These updates must align with international standards set by professional bodies like ALA and IFLA to ensure global relevance.
2. Greater emphasis should be placed on experiential learning. Embedding internships, hands-on projects, and practical modules within LIS programmes will help bridge the gap between theoretical knowledge and workplace realities.
3. Stronger partnerships with employers in libraries, archives, corporate information centres, and knowledge-based organisations are essential. Such collaboration will ensure that curricula remain responsive to labour market needs and evolving professional practices.

4. Continuous professional training for LIS educators is critical. Faculty must be equipped with digital scholarship skills and expertise in emerging technologies to address the shortage of digitally skilled instructors.
5. Periodic review of LIS curricula should be mandated by regulatory bodies such as the LRCN. This will ensure programmes remain dynamic, responsive to technological change, and aligned with both national and global professional standards.

Abstract

Open research practices are gaining momentum in the emerging research world, thus demanding that researchers leverage their data and research skills for standardising research practices. Three hypotheses guided this study, leading to its investigation of data literacy and Research Data Management (RDM) as predictors of open research practices among polytechnic lecturers in Kwara State, Nigeria. A descriptive survey design of correlational type was adopted, with a population of 1,165 lecturers in Kwara State Polytechnic and the Federal Polytechnic, Offa, in Kwara State, Nigeria. Using simple random sampling, 291 lecturers were selected, and data were collected through a validated questionnaire. Pearson Product-Moment Correlation (PPMC) was employed to test the null hypotheses 1 and 2, while regression analysis was used for hypothesis 3. Findings revealed a moderate negative correlation between data literacy and open research practices ($r = -0.440$, $p = .000$), indicating that higher data literacy was unexpectedly associated with lower engagement in open research. Conversely, RDM showed a very strong positive correlation with open research practices ($r = 0.881$, $p = .000$), suggesting that effective data management strongly enhances openness. The joint analysis demonstrated a robust predictive relationship, with $R = 0.897$ and $R^2 = 0.804$, meaning that data literacy and RDM together explained 80.4% of the variance in open research practices. The results highlight that while data literacy alone may not directly foster openness, possibly due to institutional or cultural barriers, RDM plays a decisive role in enabling transparency, reproducibility, and collaboration. The study concludes that strengthening RDM systems, alongside targeted data literacy training, is critical for advancing open research practices among Nigerian polytechnic lecturers.

Keywords: Data skills, Data literacy, Lecturers, Open research, Open science, Research data management

Introduction

The discourse on open research practices has gained significant momentum in recent years, reshaping the landscape of knowledge creation and dissemination. Open research, often equated with open science, emphasizes transparency, accessibility, reproducibility, and collaboration across the entire research cycle, from conceptualisation to dissemination. Scholars argue that this paradigm shift is not merely a technical adjustment but a transformative movement aimed at democratising knowledge and fostering equity in scholarly communication (Borghi & Van Gulick, 2021; Bertram et al., 2023). Yet, the debate persists: can open research truly thrive in academic environments where data literacy and research data management (RDM) remain unevenly developed?

On one side of the argument, proponents contend that open research practices are unattainable without robust data literacy skills. Data literacy, defined as the ability to acquire, handle, evaluate, and ethically utilise data (Downes, 2023), has become a fundamental competency in the 21st century. Lecturers, as custodians of knowledge, are expected not only to teach but also to model effective data practices. Evidence from African universities suggests that deficiencies in data literacy hinder lecturers' productivity, collaboration, and ability to engage meaningfully in open science (Kanaabi et al., 2020; Adika & Kwanya, 2020). In this view, data literacy is not optional; it is the bedrock upon which open research rests.

Conversely, others argue that while data literacy is essential, it is insufficient without effective RDM. Research data, often described as the "fuel" of scientific advancement (Arthur et al., 2024), requires systematic organisation, preservation, and sharing to ensure reproducibility and transparency. The RDM policies, such as those instituted by the NIH and Canada's Tri-Agency, highlight the global recognition of data management as a prerequisite for open science (Government of Canada, 2021; NIH, 2020). Without RDM, data risks becoming fragmented, inaccessible, or unusable, thereby undermining the very principles of openness. Critics, therefore, posit that RDM, more than data literacy, is the decisive predictor of whether lecturers can effectively adopt open research practices.

This tension between data literacy and RDM raises critical questions for Nigerian polytechnics, particularly in Kwara State, Nigeria, where lecturers face increasing demands from funders, institutions, and the global academic community to embrace open science. While some scholars, such as Zhang et al. (2022) and Ologbosere (2023) have emphasised the urgency of equipping lecturers with data literacy skills to navigate complex datasets, others stress that without institutionalised RDM systems, such skills may not translate into sustainable open research practices (Suharsiwi et al., 2023; Odigwe et al., 2020). The debate thus centers on whether data literacy or RDM serves as the stronger predictor of open research adoption, or whether their interplay is indispensable.

Against this backdrop, this study investigates data literacy and research data management as predictors of open research practices among polytechnic lecturers in Kwara State, Nigeria. Through situating the inquiry within the broader debates on openness, transparency, and reproducibility, the study seeks to clarify the relative and combined influence of these competencies. The findings are expected to contribute to ongoing scholarly discussions on how African institutions can bridge gaps in research capacity, enhance collaboration, and align with global standards of open science.

Statement of the Problem

The need to make research processes known and freely accessible to the general public have made open research practices gained significant attention in the evolving scientific, academic and research landscapes. Consequently, this heightened the need for lecturers and academics to develop skills and competencies in data handling and research data management (Abel & Rod, 2025; Andrikopoulou et al., 2022). Rantasaari (2022) stressed the evident impact of research data management on open research practices as a catalyst for fostering a collaborative research environment that facilitated the seamless research endeavours, ultimately contributing to the overall advancement and quality of scholarly output.

Despite the potential benefits of open research practices, the literature has reported a discouraging state of open research practices among academics, who ought to be its champions and advocates. Some of the notable reasons for the poor, ~~sickening~~ status of open research practices among academics include poor data literacy and research data management skills, inadequate research data management infrastructure, poor research efficacy, inadequate institutional commitment and support and poor participation among academics, inadequate competence among library staff and lack of institutional support (Ashiq et al., 2022; Tenopir et al., 2020).

The highlighted issues clearly showed that the practice of open research can be mitigated by many factors and significant progress could be recorded if future research could be tailored towards investigating these issues, as they are peculiar to specific disciplines or locations. The need to determine whether lecturers' abilities to efficiently and effectively manage research data to promote their research endeavours underscores why this study investigated data literacy and research data management as predictors of open research practices among polytechnic lecturers in Kwara State, Nigeria.

Objectives of the Study

The main objective of this study was to investigate data literacy and research data management as predictors of open research practices among polytechnic lecturers in Kwara State, Nigeria. The specific objectives are to:

1. establish the relationship between data literacy and open research practices among polytechnic lecturers in Kwara State, Nigeria;
2. establish the relationship between research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria; and,
3. establish the joint relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria.
4.

Research Hypotheses

The following null hypotheses were raised for this study and tested at 0.05 level of significance:

i. There is no significant relationship between data literacy and open research practices among polytechnic lecturers in Kwara State, Nigeria.

ii. There is no significant relationship between research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria.

iii. There is no significant joint relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria.

Review of Related Literature

Theoretical Model: Diffusion of Innovations Theory

The Diffusion Innovations Theory was proposed in 1962 at the University of New Mexico by E.M. Rogers, a communication theorist. The theory describes how various individuals who engage with or start utilising a new idea go through phases of adoption. According to the theory, invention, communication channels, time, and social systems are the four primary factors that affect how quickly a new idea spreads. In other words, diffusion is the process by which an innovation spreads over time among members of a social system via certain routes (Halton, 2023).

From introduction to broad adoption, new technical and other innovations spread throughout communities and cultures, according to a theory known as the DoI Theory. The DoI aims to explain how and why new concepts and methods are embraced, including the reasons why acceptance of new concepts may take a long time. According to DoI, people go through five stages as they develop: awareness, persuasion, decision-making, implementation, and adoption. The innovation spreads through a variety of communication channels if it is embraced. Diffusion is influenced by subjective views of the invention rather than a scientific evaluation of the idea during communication. The procedure takes place. Lastly, diffusion, diffusion norms, the roles of change agents and opinion leaders, the kinds of innovation decisions, and the outcomes of innovation are all determined by social systems (Estabrooks et al., 2006).

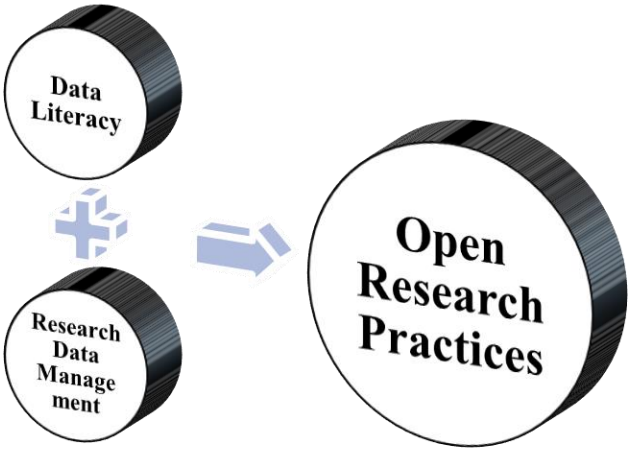
Innovators, early adopters, early majority, late majority, and laggards make up the majority of DoI. Early adopters are those who want to test new technologies and determine their usefulness in society; innovators are those who are willing to take chances and are the first to attempt novel concepts. Additionally, the early majority are members of the general public who made it possible for an innovation to be used in mainstream culture. The laggards are those who adopted new ideas and creative products later than the general population, whereas the late majority followed the early majority in incorporating the innovation into their daily lives (Halton, 2023).

Because its five components, which are innovators, early adopters, early majority, late adopters, and laggards, can be used to characterise the lecturers who have been using open research procedures based on their data literacy and RDM practices, DoI is thought to be relevant to this study. Lecturers who are willing to learn about RDM and data literacy and who are the first to experiment with open research methods are the innovators. Lecturers who are interested in data literacy and RDM and who use them for open research methods are also early adopters. Additionally, the lecturers who pioneered the use of RDM and data literacy to support open research practices make up the early majority. Additionally, the laggards are the lecturers who lagged behind the general population in utilising their data literacy and RDM skills to engage in open research practices, whereas the late majority are lecturers who adopted data literacy and RDM as part of their daily lives after the early majority.

Conceptual Model

This study adopted an intuitive conceptual model to presents the variables – Data literacy (IV 1), Research data management (RDM) (IV 2) and Open research practices (DV) as separate entity before establishing the nexus between them. Data literacy focuses on the lecturers' understanding of data, collecting data, analysing data, visualising data, storing and preserving data. communicating and sharing data and data ethics and governance. RDM encompasses data management planning, collection, organisation, storage, security and back-up, documentation and metadata and sharing and reuse. Finally, open research practices address open access to publications, open data, open peer reviews, open educational resources, open software tools and open methods and protocols.

The model is illustrated in Fig. 1



Relationships between Data Literacy, Research Data Management and Open Research

Studies in many settings and places have been conducted as a result of the requirement to determine the relationship between data literacy, RDM, and open research. This is because people's ability to use and comprehend data is essential since researchers are becoming more aware of the significance and worth of data (Vermeire et al., 2025). Open research

methods and data literacy are becoming more widely acknowledged as crucial elements of contemporary academic and societal data engagement. While open research methods encourage transparency and accessibility in research data sharing, data literacy includes the abilities required to read, comprehend, create, and transmit data successfully (Vermeire et al., 2025).

Barang (2022) highlighted the need for better involvement with data practices to support open scientific initiatives after finding that academics' data literacy about open research data was disappointing. In contrast, Casali et al. (2022) noted that researchers in education have a favourable attitude towards the benefits of open research practices, but they bemoaned the fact that over half of them are ignorant about open data repositories. With the encouragement of transparency, reproducibility, and ethical use of data, data literacy is crucial for critically analysing and using data, which is consistent with open research methods and eventually improves collaboration and knowledge sharing in research communities (Downes, 2023).

Furthermore, Koltay (2021) stressed that data literacy is crucial for open research practices since it makes it possible for researchers to successfully comprehend, analyse, and use data. It encourages a culture of transparency and cooperation in academia, which is essential for solid and repeatable research, by supporting data exchange and quality evaluation. Effective management of big datasets is becoming more and more important as data quantities increase exponentially across fields. Robust RDM techniques have become increasingly important in recent years due to the push for open science and reproducibility. Appropriate RDM maximises the return on research spending, improves data discoverability, and guarantees adherence to publisher and funder requirements (Downes, 2023).

To improve scientific research's accessibility, reproducibility, and openness, RDM and open research procedures are essential. In order to ensure that data is useful for both original researchers and the larger community, effective RDM takes into account every stage of the data lifecycle, from planning and collecting to long-term preservation (Borghi & Gulick, 2021). Because it makes it easier to share research data, which can boost the validation and impact of research findings, this management is essential for advancing open science (Casali et al., 2022; Áholz & Jaekel, 2021). Effective research data organisation, storage, and sharing are all part of RDM. By encouraging transparency and cooperation, open research practices, especially open data, improve empirical research in sports science. For successful adoption, the sports science community must adopt a cohesive strategy (Krüger et al., 2023). RDM is essential for putting open research techniques into practice and enabling efficient data utilisation across industries. Research data makes significant contributions to open science, fostering interdisciplinary cooperation and facilitating practical applications of scientific discoveries (Boiko et al., 2022).

Empirical Reviews

The increasing emphasis on open science and open research practices has brought research data management (RDM) and data literacy to the forefront of scholarly discourse. The RDM encompasses a range of activities including data creation, storage, security, retrieval, sharing, and reuse, all of which are essential for ensuring the integrity, accessibility, and sustainability of research outputs. Data literacy, defined as the ability to locate, interpret, manage, and ethically use data, provides the foundational skills necessary for effective RDM. Together, these competencies are critical predictors of open research practices, which emphasize transparency, collaboration, and accessibility through mechanisms such as open peer review, open access publishing, and data sharing in repositories.

Empirical evidence from Nigeria and other African contexts underscores the significance of RDM in enhancing research effectiveness. Odigwe et al. (2020) demonstrated that data storage, security, retrieval, sharing, and reuse significantly contributed to educational research effectiveness among lecturers in South-south, Nigeria. Their regression analysis revealed that RDM practices accounted for substantial variance in outcomes such as proper citation, problem-solving, knowledge creation, and the generation of testable data. Similarly, Tunmibi and Ajokotola (2024) reported high levels of RDM services in Lagos State university libraries, including data creation, preservation, sharing, and reuse, suggesting that institutional support can enhance RDM adoption. However, Abiodun-Asanre (2024) found that health librarians in Nigeria possessed inadequate RDM skills despite strong personal and library competencies, highlighting the persistent gap in data literacy that limits the provision of RDM services.

The literature also reveals challenges in the adoption of open research practices. Ajani et al. (2023), in their study of librarians in Kwara State, Nigeria, observed engagement in open peer review, open access publishing, and institutional repositories. Nevertheless, barriers such as lack of training, fear of plagiarism, and limited awareness hindered deeper involvement. These findings are particularly relevant to polytechnic lecturers in Kwara State, who may face similar obstacles in adopting open research practices. Adekoya et al. (2025) further emphasized the need for developing “data-savvy librarians” through mentoring, workshops, and industry exposure, while Mosha and Ngulube (2025) identified ICT infrastructure and organizational support as critical enablers of RDM in Tanzanian higher education institutions.

Comparative insights from global contexts reinforce these observations. Ferguson et al. (2023) reported that nearly 90% of scholars in North America had used at least one open science practice by 2020, with strong support for data and code sharing. However, scholars underestimated the prevalence of such practices in their fields, suggesting a gap between perception and reality. Shelly and Jackson (2020) found inconsistencies in RDM support across Australian universities, with strong encouragement for secure data storage but limited practical guidance. Similarly, Kinde et al. (2021) revealed

low awareness of RDM among Ethiopian faculty, with most relying on personal devices for data storage, while Buhomoli and Buneja (2023) observed that Tanzanian researchers practiced data sharing primarily within research groups, reflecting cultural and institutional barriers to broader open research engagement.

Synthesizing these findings, three themes emerge. First, RDM practices are strong predictors of research effectiveness, as evidenced by their contribution to citation accuracy, knowledge creation, and problem-solving. Second, data literacy remains underdeveloped among lecturers and librarians, limiting their ability to fully utilize RDM services and engage in open research. Third, institutional and cultural barriers including fear of plagiarism, lack of awareness, inadequate infrastructure, and weak policy frameworks continue to restrict the adoption of open research practices. For polytechnic lecturers in Kwara State, these insights suggest that data literacy and RDM skills are critical determinants of their ability to engage in open research.

Methodology

This study adopted a descriptive survey design of a correlational type. The design helped the researchers in establishing the relationships or otherwise of how data literacy and research data management help in predicting open research practices among polytechnic lecturers in Kwara State, Nigeria. The population of this study is 1,165 lecturers in government-owned polytechnics in Kwara State, Nigeria. The studied polytechnics included Federal Polytechnic, Offa, and Kwara State Polytechnic, Ilorin. A simple random sampling technique was employed to select 291 lecturers as advised by the Krejcie and Morgan (1970) sampling table. A self-designed questionnaire with good and acceptable gradings for the variables - Open research practices (.77); Data literacy (.83) and Research data management (.90). Data collected through the questionnaire was presented in Pearson Product Moment Correlation (PPMC) to analyse the results of hypotheses 1 and 2, while regression analysis was used to analyse the hypothesis 3 implying that inferential statistics was used in this study.

Demographic Characteristics of the Respondents

Table 1: Respondents' Demographic Information

Options		F	%
Respondent's institution	Kwara State Polytechnic, Ilorin	117	51.6
	Federal Polytechnic, Offa	109	48.4
	Total	**226**	**100**

Source: Researchers' Field Survey, 2025

Table 1 reveals that Kwara State Polytechnic, Ilorin, has the majority of respondents (117 or 51.6%), while Federal Polytechnic, Offa, has the second largest (109 or 48.4%). On gender, 131 (68.8%) are males, while only 88 (38.9%) are females. In the age range, 41 – 50 years has the highest representation with 90 (39.8%), followed by 31 – 40 years (67, 29.6%), 51 – 60 years (29, 12.8%), 21–30 years (28, 12.4%) and 61 years and above (12, 5.3%). Moreso, on highest academic qualifications, 106 (46.9%) are MSc/MA/MLIS/ML holders, followed by BSc/BA/BLIS/BL (82 36.3%), HND (22 9.7%) and Ph.D. (16 9.1%). Moreso, 105 (46.5%) have 11 – 15 years, followed by 16 – 20 years (48 21.2%), 6 – 10 years (40 17.7%), 1 – 5 years (27 11.9%) and 21 years and above (6 2.7%). Finally, 143 (63.3%) of the respondents are married, followed by single (72, 31.9%), divorced (8 3.5%) and widowed (3, 1.3%).

Hypotheses Testing

Hypothesis 1: There is no significant relationship between data literacy and open research practices among polytechnic lecturers in Kwara State, Nigeria.

Table 2: PPMC results showing the relationship between data literacy and open research practices of polytechnic lecturers in Kwara State, Nigeria

S/N	Variables	Mean	SD	Df	Correlations ®	Sig. P	Remark
1.	Data literacy	18.97	3.70	226	-.440**	.000	Significant
2.	Open research practices	15.31	4.25	226			

**. Correlation is significant at the 0.05 level (2-tailed).

Decision Rule: Reject Ho_1 if the p-value is ($p<0.05$). If otherwise, do not reject (i.e., if the p-value is greater than (or equal to 0.05).

From the descriptive statistics, the mean score for data literacy is 18.97 with a standard deviation of 3.70, indicating a relatively high and consistent level of data literacy among the respondents. In contrast, the mean score for open research practices is 15.31 with a slightly higher standard deviation of 4.25, suggesting more variability and a generally lower level of engagement in open research practices.

The findings reveal a moderate negative correlation between data literacy and open research practices, with a correlation coefficient of $r = -0.440$. This suggests that as polytechnic lecturers' data literacy increases, their engagement in open research practices tends to decrease. The correlation is statistically significant at the 0.05 level, as indicated by the p-value of .000, which is well below the threshold for significance. Therefore, the null hypothesis is rejected.

This inverse relationship is somewhat unexpected, as one might assume that higher data literacy would naturally support and encourage open research practices. However, the negative correlation may point to underlying institutional, cultural or policy-related barriers. For instance, polytechnic lecturers who are more data literate may also be more aware of the risks and challenges associated with open research, such as data privacy concerns, lack of incentives or inadequate infrastructure for sharing research openly.

Hypothesis 2: There is no significant relationship between research data management and open research practices of polytechnic lecturers in Kwara State, Nigeria.

Table 3: PPMC results showing the relationship between research data management and open research practices of polytechnic lecturers in Kwara State, Nigeria

S/N	Variables	Mean	SD	Df	Correlations ®	Sig. P	Remark
1.	Research data management	25.71	3.00	226	.881**	.000	Significant
2.	Open research practices	15.31	4.25	226			

**. Correlation is significant at the 0.05 level (2-tailed).

Decision Rule: Reject Ho_1 if the p-value is ($p<0.05$). If otherwise, do not reject (i.e., if the p-value is greater than (or equal to 0.05).

The findings reveal a strong and statistically significant relationship between research data management (RDM) and open research practices (ORP) of polytechnic lecturers in Kwara State, Nigeria. The mean score for RDM is 25.71 with a standard deviation of 3.00, indicating a relatively high and consistent level of engagement in managing research data among the librarians. In contrast, the mean score for ORP is 15.31 with a higher standard deviation of 4.25, suggesting more variability in how librarians engage in open research practices.

The Pearson correlation coefficient ($r = 0.881$) shows a very strong positive correlation between the two variables. This means that librarians who are more involved in research data management are also more likely to participate in open research practices. The significance value ($p = 0.000$) is well below the threshold of 0.05, leading to the rejection of the null hypothesis. Therefore, the relationship is not due to chance and is statistically significant.

In essence, the data suggests that improving research data management among academic librarians could positively influence their adoption of open research practices. This has practical implications for university policy makers and library administrators, who may consider investing in training and resources that support both RDM and ORP to foster a more open and collaborative research environment.

Ho_3: There is no joint significant relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria.

Table 4: Model Summary results showing the joint significant relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria

Model	R	R Square	Adjusted R-Square	Std. Error of the Estimate
1	.897[a]	.804	.803	1.88711

a**. Predictors:** (Constant), Research data management, Data literacy

The findings from the Model Summary indicate a strong and meaningful relationship between the independent variables, data literacy and research data management, and the dependent variable, open research practices. The correlation coefficient (R) of 0.897 suggests that the model has a high predictive strength, meaning that the combination of data literacy and research data management is closely associated with the level of open research practices among the lecturers.

The R-squared value of 0.804 implies that 80.4% of the variation in open research practices can be explained by the two predictors. This is a substantial proportion, indicating that these factors play a major role in shaping how lecturers engage with open research. The Adjusted R Square, which accounts for the number of predictors and sample size, is 0.803, showing that the model remains robust and reliable even after adjusting for potential bias.

Additionally, the standard error of the estimate, which is 1.88711, reflects the average distance between the actual values and the values predicted by the model. While this figure suggests some level of prediction error, it is relatively low, further supporting the model's accuracy. The statistical evidence supports the conclusion that data literacy and research data management are significant and effective predictors of open research practices. This suggests that efforts to improve these areas among lecturers could lead to greater adoption and implementation of open research principles in polytechnic institutions.

Table 5: ANOVA results showing the joint significant relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria

Model		Sum of Squares	Df	Mean Square	F	Sig.
1	Regression	3266.175	2	1633.087	458.580	.000[b]
	Residual	794.144	223	3.561		
	Total	4060.319	225			

a. **Dependent Variable:** Open research practices

b. **Predictors:** (Constant), Research data management, Data literacy skills

The regression sum of squares is 3266.175, which represents the portion of the total variation in open research practices that is explained by the predictors, data literacy and research data management. In contrast, the residual sum of squares is 794.144, indicating the variation that remains unexplained by the model.

The degrees of freedom for the regression are 2, corresponding to the two predictor variables, while the residual degrees of freedom are 223, based on the sample size. The mean square values are 1633.087 for regression and 3.561 for residual, and are used to compute the F-value, which is 458.580. This very high F-value suggests that the model is highly effective in explaining the variation in open research practices. Most importantly, the significance level (p-value) is .000, which is well below the conventional threshold of 0.05. This means that the relationship observed is not due to chance, and there is a statistically significant joint effect of data literacy and research data management on open research practices of polytechnic lecturers in Kwara State, Nigeria.

The ANOVA results strongly support the conclusion that data literacy and research data management significantly influence open research practices among polytechnic lecturers. This implies that enhancing these competencies could lead to greater adoption and implementation of open research principles in the academic environment.

Table 6: Coefficients[a] results showing the joint significant relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria

		Unstandardised Coefficients		Standardised Coefficients		
Model		**B**	**Std. Error**	**Beta**	**t**	**Sig.**
1	(Constant)	8.862	.894		9.911	.000

Data literacy skills	-.206	.036	-.180	-5.752	.000
Research data management	.552	.021	.824	26.389	.000

a. **Dependent Variable:** Open research practices

The findings reveal a statistically significant model, indicating that both data literacy and research data management jointly influence open research practices of polytechnic lecturers in Kwara State, Nigeria. However, the nature and strength of their influence differ markedly. Firstly, research data management emerges as a strong positive predictor of open research practices. With a standardised coefficient (Beta) of 0.824 and a highly significant p-value ($p < .001$), it suggests that lecturers who are proficient in managing research data such as organising, storing and preserving data are much more likely to engage in open research practices. This aligns with the idea that effective data management facilitates transparency, reproducibility and sharing, which are core to open research.

In contrast, data literacy skills show a negative and significant relationship with open research practices (Beta = -0.180, $p < .001$). This is somewhat counterintuitive, as one might expect that higher data literacy would support open research. The negative coefficient implies that as data literacy increases, engagement in open research practices decreases. This could be due to several contextual factors. For instance, lecturers with higher data literacy might be more aware of the risks associated with data sharing, such as data misuse, intellectual property concerns or lack of institutional support, leading to more cautious behaviour. The constant term in the model is also significant, indicating that even in the absence of the two predictors, there is a baseline level of open research practice among lecturers.

Overall, the model underscores the importance of research data management as a key enabler of open research practices. However, the unexpected negative relationship with data literacy suggests a need for further qualitative investigation to understand the underlying reasons. Institutions may need to address barriers and provide clearer guidelines or incentives to ensure that data literacy translates into more open and collaborative research behaviours.

Discussion of Findings

Relationship between data literacy and open research practices among polytechnic lecturers in Kwara State, Nigeria

The findings reveal a statistically significant moderate negative correlation between data literacy and open research practices among academic librarians, with a correlation coefficient of $r = -0.440$ and a p-value of .000. This result suggests that as librarians' data literacy increases, their engagement in open research practices tends to decrease. At first glance, this outcome appears counterintuitive, especially when compared with existing literature that generally portrays data literacy as a catalyst for open research. For instance, Downes (2023) describes data literacy as the ability to critically acquire, manage, evaluate, and use data, arguing that such competencies are essential for participating in open science. Similarly, Koltay (2021) emphasises that data-literate individuals are better equipped to interpret and share data transparently, which aligns with the principles of open research. These perspectives suggest a positive relationship between data literacy and openness in research, which contrasts with the negative correlation observed in this study.

One possible explanation for this discrepancy lies in the clear understanding that increased data literacy may also heighten awareness of the risks and responsibilities associated with data sharing. Donaldson et al. (2023) note that individuals with higher data literacy are often more cautious about data privacy, ethical considerations and legal compliance. This heightened awareness may lead to reluctance in sharing data openly, especially in environments where institutional support for open research is limited or unclear. The context of the study also provides important insights. Ajani et al. (2023) found that librarians in this region face several barriers to open research, including fear of plagiarism, lack of awareness and inadequate infrastructure. These challenges may discourage even data-literate librarians from engaging in open research practices. Moreover, Masenya (2021) highlights that many African institutions lack comprehensive policies and systems for research data management, which further complicates efforts to promote openness.

Another factor to consider is the cultural and psychological resistance to technological change. Timms (2023) discusses how some researchers, particularly those more familiar with data systems, may resist open research due to concerns about job security and the implications of artificial intelligence and automation. This resistance may be more pronounced among those with higher data literacy, who are more aware of the broader consequences of data openness. The theoretical framework adopted in the study, the Diffusion of Innovations Theory, offers a useful lens for interpreting these findings. According to Rogers (1962), individuals adopt innovations through a process that includes awareness, persuasion, decision, implementation, and confirmation. Data-literate librarians may still be in the persuasion or decision stages, hesitant to fully embrace open research due to perceived risks or lack of institutional incentives.

Relationship between research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria

The finding that RDM significantly influences ORP among polytechnic lecturers in Kwara State, Nigeria, is consistent with global trends and theoretical expectations. This relationship is not only statistically significant but also conceptually

grounded in the broader movement toward open science, which emphasises transparency, accessibility and collaboration in research. Open research practices, as defined by Borghi and Van Gulick (2021), involve the sharing of research materials, methodologies and data in a manner that promotes reproducibility and innovation. These practices are deeply intertwined with RDM, which encompasses the planning, organization, storage, documentation and sharing of research data.

In the context of polytechnic lecturers in Kwara State, Nigeria, the role of RDM is particularly pronounced. Librarians are often at the forefront of data curation, repository management and the implementation of institutional data policies. Studies such as those by Subaveerapandiyan and Ugwulebo (2024) and Ajani et al. (2023) demonstrate that librarians actively engage in open research through practices like open peer review, depositing research in institutional repositories and publishing in open access platforms. These activities are underpinned by robust RDM systems that facilitate the discoverability and reuse of research data.

The theoretical underpinning of this relationship can be framed within the Diffusion of Innovations (DoI) theory, which explains how new ideas and practices spread within a social system. Polytechnic lecturers in Kwara State, Nigeria, may be viewed as early adopters of RDM and ORP, given their proactive engagement and institutional roles. Their adoption of these practices sets a precedent for other academic stakeholders, including lecturers to follow suit. Empirical evidence further supports the significance of RDM in promoting ORP. Odigwe et al. (2020) found that data management practices such as storage, sharing and reuse significantly contribute to research effectiveness among university lecturers. Similarly, Adika and Kwanya (2020) identified gaps in RDM literacy among Kenyan lecturers, which hindered their participation in open research.

Joint relationship among data literacy, research data management and open research practices among polytechnic lecturers in Kwara State, Nigeria

The regression analysis reveals a statistically significant model, indicating that both data literacy and research data management (RDM) are influential predictors of open research practices among polytechnic lecturers in Kwara State, Nigeria. However, the nature and strength of their influence differ, a finding that aligns with and is enriched by existing literature. Data literacy is conceptualized in the study as the ability to collect, analyse, interpret and effectively use data to inform decision-making and problem-solving. It encompasses a range of competencies, including data collection, analysis, visualisation, storage, sharing and ethical governance (Downes, 2023; Casali et al., 2022). These skills are increasingly recognised as essential in the 21st-century academic landscape, where data-driven research is the norm (Vermeire et al., 2025). The study's findings support the assertion by Suharsiwi et al. (2023) that data literacy significantly affects lecturers' research performance, particularly in enhancing transparency, reproducibility and collaboration in open research.

In contrast, research data management refers to the systematic processes involved in planning, organising, storing, sharing, and preserving research data throughout its lifecycle (Borghi & Van Gulick, 2021; Abiodun-Asanre et al., 2024). The RDM is more structural and institutional in nature, often requiring policy frameworks, infrastructure and collaborative support systems. The study's findings resonate with the work of Kinde et al. (2021), who emphasised the growing pressure on researchers to improve their RDM practices due to funder and institutional mandates. Furthermore, RDM is crucial for ensuring data integrity, facilitating reuse and enhancing the visibility and impact of research outputs (Fürholz & Jaekel, 2021).

While both data literacy and RDM contribute to open research practices, their roles are distinct. Data literacy is more individual-centric, focusing on the personal capabilities of lecturers to engage with data meaningfully. RDM, however, is system-centric, emphasising the institutional and procedural mechanisms that support sustainable data handling. This distinction is critical, as it suggests that improving open research practices requires both personal skill development and institutional support. The joint influence of data literacy and RDM on open research practices is further contextualised by empirical studies. For instance, Odigwe et al. (2020) found that effective data management practices, including storage and sharing, significantly enhance educational research effectiveness. Similarly, Adika and Kwanya (2020) identified gaps in RDM literacy among lecturers, which hinder their ability to engage in open research. These findings underscore the importance of integrating both data literacy and RDM training into academic development programs.

Moreover, the study's findings align with the theoretical framework of the Diffusion of Innovations Theory (Rogers, 1962), which explains how new ideas and practices spread within a social system. Lecturers who are innovators or early adopters of data literacy and RDM are more likely to engage in open research practices, thereby influencing their peers and contributing to a broader cultural shift within academic institutions.

Conclusion

The findings of this study underscore the pivotal role of research data management (RDM) in driving open research practices among polytechnic lecturers in Kwara State, Nigeria. While data literacy was found to have a significant but negative correlation with open research practices, RDM demonstrated a strong and positive relationship, suggesting that lecturers who actively engage in systematic data organization, preservation, and sharing are more likely to adopt open research practices. This highlights that while data literacy equips lecturers with the skills to handle data, it is the

structured application of these skills through RDM that truly enables transparency, reproducibility, and collaboration in research.

Furthermore, the joint analysis revealed that data literacy and RDM together account for over 80% of the variation in open research practices, emphasizing their combined importance as predictors. The unexpected inverse relationship between data literacy and open research practices may reflect contextual challenges such as inadequate infrastructure, fear of plagiarism, or institutional barriers that discourage lecturers from openly sharing data despite their competence. Conversely, the strong positive influence of RDM suggests that institutionalized systems and practices for managing data provide the necessary framework for lecturers to confidently engage in openness.

Above all, this study affirms that strengthening RDM capacities, alongside fostering data literacy, is essential for advancing open research practices in Nigerian polytechnics. Institutional support, policy frameworks, and training programs must prioritize RDM infrastructure while addressing cultural and systemic barriers to openness. By doing so, lecturers can be empowered not only to manage data effectively but also to embrace open science as a sustainable and collaborative model of knowledge creation and dissemination.

Recommendations

Based on the findings, this study recommends that:

1. Polytechnic management should strengthen RDM infrastructure. This could be achieved by establishing secure institutional repositories for data storage and sharing, developing clear policies and guidelines for data preservation and reuse and providing long-term preservation systems to ensure sustainability of lecturers' research outputs.
2. Polytechnic management should partner with relevant associations and agencies to invest in capacity-building initiatives such as organizing workshops, seminars, and mentoring programs to improve lecturers' data literacy skills. The data literacy training should align with practical applications of RDM to ensure lecturers can translate knowledge into practice.
3. Polytechnic management and regulating bodies should address cultural and systemic barriers by implementing awareness campaigns to reduce fear of plagiarism and increase confidence in open research. This can be achieved by creating reward and incentive systems for lecturers who adopt open research practices.
4. Polytechnic management should embed openness into institutional research policies and ensuring that policy frameworks support compliance with funder and publisher requirements for openness. This will encourage collaboration across departments and institutions to foster a culture of transparency.

Abstract

The library is an agent of social and political transformation in every given society. Democratic dispensations are usually preferred by nations because it is assumed to have the magic wand to improve socio-economic welfare of the people while achieving national development. Libraries play a pivotal role in enhancing good democratic governance by participating actively as the information "dispenser", this they do through the provision of good information which drives innovation and has a major impact on National development. Sensitization during election seasons curbs electoral malpractice and apathy thereby strengthening our democracy, rural mass literacy programs plays a major role in educating the population and fostering literacy culture, symposiums, conferences and seminars help create awareness. The idea that to develop a nation is to educate them and give them access to necessary information is the ultimate role being played by the library. This paper concludes that the library must be treated as the information hub of a nation and it is through the instrument of provision of vital information that it can impact on National Development and strengthen Democracy.

Key Words (Democracy, Governance, National Development, Libraries, Information Centre)

Introduction

The movement of information is the basic pillar upon which every meaningful national development is anchored on, and democratic settings have been adjudged to speed up development for nations that adopt them. Article 19 of the Universal Declaration of Human Rights declared that the right to information is a fundamental right. Libraries being a knowledge institution are at the forefront of facilitating this right.

According to Okoye and Ibeh (2013) Libraries are important institutions through which democracy could be strengthened and it affects every part of man's social, economic and political life. According to Ifijeh & Iwu-James (2020) Democracy thrives on transparency, accountability, and informed citizenry. Libraries play a crucial role in sustaining democratic principles by providing access to unbiased information that enables citizens to make informed decisions. The availability of credible news sources, historical records, and policy analyses in university libraries helps prevent misinformation and promotes fact-based political engagement.

Nigerian libraries are well placed to contribute meaningfully and effectively in political and developmental stability of the nation for a positive change, most especially to enlighten the populace on the political status of the nation. More so, there were emphasizing on the key areas of information provision and dissemination by libraries, such as provision of adequate political information, supporting educational development, Re-orientation of Nigerian political culture, provision of information materials, provision of open access to information, creation political awareness etc. to the development of a nation politically stable (Ofondu & Okwoli, 2023).

Ikenga and Chima (2021) stated that democracy especially in the third world countries has become a mighty beacon where it is plagued with extreme level of corruption, insecurity, political instability, abuse of law and has assumed the front burner as an indispensable requirement for social, economic and political development and stability restructuring factor, to most countries including Nigeria. Nigeria operates a democratic system of government and thus is not immune to the challenges that come with democratic dispensations, it is necessary therefore that both the elected and the electorates have access to accurate information that will broaden their horizon and make for better decision making and to acquire these information and knowledge, one must achieve it through reading of books and consulting other information materials which are normally stored in the library (Ofondu & Okwoli, 2023). Also, Idogbe and Philip (2020) emphasizes that libraries as knowledge entities have been concerned with human development; mostly it takes into consideration its community in gaining knowledge through the provision and making available such inspiring resources

that will offer the community a wide range of information and knowledge. The library is an ultimate organisation when it comes to attainment of knowledge, information, education and ultimately societal development. Presently, libraries have been and remained the forefront in fostering a stable and functional education which is fundamental to the development of any democratic society. (Abata-Ebire, Adebowale and Ojokuku, 2018).

This study, therefore, seeks to investigate the roles of libraries as information institutions in enhancing political participation and cultural creativity to enhance national development in Nigeria. In achieving this, the focus of this presentation would be on creation and distribution of information and participation, federalism, democratic governance, individual's response to political campaign messages etc.

Statement of Problem

The development of any nation is influenced by the level of the information it has access to and the integration of such information into critical areas that will further develop those areas. It is thus pertinent for scholarly efforts to improve the level of development for a nation, to work on the level of information available to the people and their access as a means towards national development. While some literatures especially in Information Science have treated information creation, very few have considered factors that can improve access to such information by the populace in Nigeria, also there seem to be none that considers the concept of information integration especially during election periods to strengthen democratic participation in the field of Librarianship.

The purpose of this work therefore is explore the usefulness of libraries and give an in-depth study on how libraries act as a catalyst to national development with particular reference to Nigeria as a growing nation.

Definitions of Key Concepts

Democracy

According to Betham (1989) democracy is a form of government based on popular rule or popular control over collective decision-making where citizens are entitled to their opinion on public affairs both through the association of civil society and through participation in government. Shehu (2019) asserts that democracy depends upon a literate and knowledgeable citizenry whose access to information enables it to participate as fully as possible in the public life of society and criticize unwise or oppressive government officials and policies. In a democratic state, citizens and their elected representatives recognize that democracy depends upon the widest possible access to uncensored data, ideas and opinions. For democratic governance to succeed, citizens must be free to express themselves openly, publicly and repeatedly both in speech and writing (Augie, 2004)

Governance

Governance means the Process of decision making and the process by which decisions are implemented or not implemented, governance is thus about execution, or what has traditionally fallen within the domain of public administration, governance chiefly focuses on the process of governing involving interactions between various formal and informal institutions as well as influencing the policies and decisions that concern public lives. The success of governance depends on the reinvention of the government, reinvigoration of non-government sectors and their willingness to positively impact the people (Mehraj, 2020).

According to the UN Development Programme (2011), governance refers to the exercise of political and administrative authority at all levels to manage a country's affairs. It comprises the mechanisms, processes and institutions, through which citizens and groups articulate their interests, exercise their legal rights, meet their obligations and mediate their differences. Specific reference is made to democratic governance as "a process of creating and sustaining an environment for inclusive and responsive political processes and settlements."

National Development

National development is includes all aspects of the life of an individual and the nation. It is very comprehensive in nature. It is a method of reformation and development of various scope of a nation and the development of individuals. It consists of full-growth and expansion of our industries, agriculture, and education, social, religious, and cultural institutions. Moreover, national development implies the development of a nation as a whole. It can be best defined as the all-round and balanced development of different aspects and facets of the nation viz. political, economic, social, cultural, scientific, and material (Bhawna, 2016).

According to Lawal and Oluwatoyin (2011) national development can be described as the overall development or a collective socio-economic, political as well as religious advancement of a country or nation. This is best achieved through development planning, which can be described as the country's collection of strategies mapped out by the government.

Libraries and Information Centres

According to Taye (2011) Library is defined as an organized collection of published books and audio-visual materials with the aid of the services of staff that are able to provide and interpret such materials as required, to meet the informative research, educational and recreational needs of its users. It is an agency through which sources of information of accumulated knowledge and experience are selected, acquired, organized, preserved and disseminated. Libraries and information centers provide a much wider range of information services from

local, state and federal governments; organizations/institutions within and outside the country among others for the people. With the provision of variety of information sources, users of libraries and information centers are exposed to different information with their respective values. A very important word, which is functionally synonymous with library, is "information dissemination". These are centers that are charged with the collection, organization, preservation, retrieval, dissemination, access, and use of information in any format.

Libraries and National Development: an overview

Country development are not adjudged same, some nations are miles above others in terms of development and technological advancements and this is the direct consequence why some nations are referred as developed, while others are referred as developing. Nigeria as a nation unfortunately is a third world nation whose development is still on the feeders stage. Idogbe and Philip (2020) asserts that Nigeria as a nation that exists with stable community of people is expected to change/develop to a modernized state. Such a nation expected to develop gradually from her traditional or created level to a modern state. It is worth noting that the difference between a developed nation and its developing counterparts has always been felt in the areas of information access. The Impact of the lack of access to information can seriously impact economic opportunities for disconnected individuals and nations. Nations and individuals who do not have access to information may be unable to properly educate its populace and thereby not be able to create proper jobs. Additionally, countries without stable access to critical information to power important sectors of the economy can face challenges to economic development. However, the library can help mitigate this divide and economic opportunities may increase. Aguolu (1997) stresses that access to most of the world's wealth of information will remain a myth for the developing countries until they overcome the prevailing obstacles, which include high rate of illiteracy, unawareness of the relevance of information, poverty and lack of infrastructural facilities

Muzahidul et al. (2012) asserts that information is playing one of the key roles in advancement of a nation. In this modern era, without the development of information and its dissemination, the dream of development and national advancement of a country would be a distant dream. However information cannot be useful on itself if there is no functional library serving as the conduit and as a driving force in establishing an idea in to society and state. It is of great importance to note that information cannot be separated from education and that the library is an information provider. This is to say that provision of accurate information by libraries, is the key to knowledge, which is a pre-requisite for holistic development in the contemporary age (Idogbe & Philip, 2020). The role of education in nation-building (Nigeria) is collaborated with the functions of libraries especially public libraries, which include primarily the collection, organisation and provision of information relevant to build the society's knowledge base. For this reason, the value of any institution is by all standards, immeasurable for any nation in search of national development and modernisation. Schoenbrum (2017) added that libraries have the mandate to drive education for national development by implementing their core function, which is to provide a conducive place for citizens to access a broad range of information.

The main pillars of rapid economic growth and development include adequate well-trained and skilled manpower, a predominantly literate populace, appropriate technology to explore and exploit the various natural resources of the country, and also a conducive political and social atmosphere guarantees national development. Igwela and Nsirim (2017) observes that for a nation to develop, it needs to have and provide relevant, updated and adequate information on food security, health, democracy, population, education, family planning, youth empowerment, gender equality, environment etc. Libraries are established for proper management, provision and communication of such information. Information is a vital ingredient of a successful nation and the most effective agency for collecting, documenting and disseminating such information is a good library. To be successful, an industrialist requires the most current product information, company information and market information. All these forms of information are usually made available by the special librarian in the form of summaries, abstracts and bulletins. The library will also aid research on raw materials and other items that directly affect the operations of the parent organization. It is, therefore, a matter of great importance for the industrial and commercial sectors of our economy to devote substantial amounts of money to the establishment and maintenance of libraries where relevant information will be readily available at all times (Ibrahim & Ahmad, 2025).

The Roles of libraries during democratic dispensations

Provision of Information to all Citizens

Kranich (2020) asserts that democracies need libraries. An informed public constitutes the very foundation of a democracy; after all, democracies are about discourse—discourse among the people. If a free society is to survive, it must ensure the preservation of its records and provide free and open access to this information to all its citizens. It must ensure that citizens have the resources to develop the information literacy skills necessary to participate in the democratic process. It must allow unfettered dialogue and guarantee freedom of expression. All of this is done in our libraries, the cornerstone of democracy in our communities. Libraries are for everyone, everywhere. They provide safe spaces for public dialogue. They disseminate information so the public can participate in the processes of governance. They provide access to government information so that the public can monitor the work of its elected officials and benefit from the data collected and distributed by public policy makers. They serve as gathering places for the community to share

interests and concerns. They provide opportunities for citizens to develop the skills needed to gain access to information of all kinds and to put information to effective use.

Roach (2012) writes that vital democratic systems require a well-informed citizenry. To be able to form a political will and to participate in democratic decision-making citizens must have unrestricted access to all the information needed and related to subjects of public and individual interest. This implies the absence of censorship in any form. Libraries have to adopt a non-biased attitude and to provide the broad range of opinions. A second obligation consists in their role as transparency institutions. As such they "should collect information materials issued by official bodies, particularly those that deal with citizens' rights and entitlements" (IFLA Manifesto on Transparency, 2008). If citizens don't have the chance to access official sources, material of anti-corruption NGOs and other relevant sources at the same time an informational dissymmetry will come into being which hinders or even prohibits political participation and democratic control of the authorities. An improvement of political participation via library services requires libraries which are free of commercialization and ideological biases. Libraries have to serve as a kind of informational shelter for all their users. The relation between the library and their users has to be one of strict confidentiality, secrecy and respect of privacy. It must be guaranteed to users that their personal data remain secret and will be protected in principle. Thus, the library will be a place where citizens are able to access information of their choice without any restrictions

Political Education

Political education in a democracy involves conscious efforts for and by citizens to acquire cognitive, procedural and habitual democratic skills. According to Jaeger and Burnett (2005) every democratic society relies on deliberation and dialogue between social groups with varying perspectives to provide for the representation of the diverse members of the society. The library in its own case is ready to maintain certain basic skills through organizing talks on elections using the information resources housed in it, that would empower the citizens and the leaders to become self-reliant, and foster interactions in order to move away from social vices like stealing, embezzlement, hijacking of voting materials, election violence, etc., that could jeopardize the democracy. Skills like digital literacy, information literacy, are better delivered to the citizens through the library to enable them use the computers effectively during elections/voting exercises to get information, to vote for their candidates and source for election better practices (Alex-Nmecha, Horsfall & Igbinovia, 2017).

Preservation of Knowledge

According to Kaur (2025) libraries have historically been seen as quiet repositories of books, offering spaces for study, reflection, and access to knowledge. However, the 21st century has ushered in dramatic shifts in information technology, digital media, and social dynamics. As a result, libraries are evolving beyond their traditional roles. They are becoming essential digital literacy hubs and vital community centres, responding to the needs of increasingly diverse, digitally-driven populations. This transformation is not merely aesthetic or superficial; it reflects a deep structural shift in how libraries operate, serve, and engage with the public. Today's libraries are no longer just warehouses of printed knowledge but proactive agents of digital inclusion, education, and political education hubs which facilitates political awareness, democracy, and social integration. Technological advances should have ushered in some changes in society, which as a whole has become more complex and digitally integrated; therefore, libraries are increasingly becoming essential in facilitating civic literacy, information integrity and digital citizenship. Library roles in Democratic republics provide a comfortable, welcoming, and unbiased place where people can access political thought, civic responsibility, and civic policies. Kohli and Rana (2025) states that the library act as: (Information centres that make government documents, electoral rolls, databases of public policies and the local governance information available (Civic learning centres that provided lectures, workshops and voter registration drives (Communal forums where a citizen can meet with other citizens and discuss the current events or engage in debates or town halls style, get together Citizens frequently go to libraries, when they want to clear their confusion about civic rights, social schemes or about which legal procedure to go through. Their non-commercial community-based character makes them such special trusted institutions at an age of institutional mistrust.

Active Citizens Engagement During Elections

According to Brooks (2024) Library leaders play an essential role in ensuring free access to information for all. The library has a responsibility to cultivate a democracy grounded in respectful, yet robust, public engagement." libraries are taking active steps to advocacy of media and information literacy (MIL) which involves training users on the evaluation of sources, ascertaining of facts and propaganda detection, browsing and verifying sources of facts and work with civic technology sites to present reliable sources. Libraries also conduct professional training of the librarians to play the role of information intermediary in aiding users to differentiate between real and manipulative information. There is also no denying that the availability of the internet and digital skills is critical to political engagement as more services become digitalized, libraries bridge this gap by: providing the underprivileged access to free internet and digital online gadgets, keeping e-governance kiosks where users are led through the mode of accessing welfare schemes, raise grievances or submit an RTI (Right to Information) petition, training in digital literacy especially to senior citizens, in the rural areas and to women.

Daniela et al. (2021) asserts that libraries stimulate deliberation, inclusion, and equality, which are the cornerstones of participatory democracy, as they serve as the place of social interaction between people that work as the public spheres. These services, collections, and programs will promote the knowledge, skills, and confidence of the citizens to have access to and participate in the governance process and combat misinformation, as well as demand their rights. Libraries are central places of political awareness and active citizenship, based both on their historical role in equalizing civil liberties and access to knowledge, and their contemporary role in digital literacy, civic engagement, and freedom of expression.

In conclusion, libraries as information service delivery outlets play an important role in ensuring effective democratic governance and national development in Nigeria. They provide and equip the citizenry with relevant information that will enable them participate actively in the democratization process. Libraries garner information to do with voting rights, election procedures, civic education, national core values, citizens' moral obligations to society and enhance democratic governance and national development in Nigeria.

Challenges facing the Library in the Discharge of these Roles

Poor Funding

Kolajo and Olatoye (2025) observes that a major challenge faced by most libraries in Nigeria is that of poor funding. Both governments owned libraries and business libraries face this problem. The majority of public libraries do not currently have enough infrastructures. They use out-dated reference materials. There are no dedicated spaces for the music library or audio-visual resources, nor are there any spaces for serious readers, particularly those conducting study. Ebiwolate (2010) asserts that lack of proper funding of public libraries, budget non-approval, and the failure to release or implement approved budgets has culminated in substandard service conditions, a scarcity of professional staff, inadequate human resource management, severely deteriorated structures and facilities, out-dated resources, challenges in extending services to rural areas, and insufficient ICT facilities, among other issues.

It is of the opinion of the authors that finance/ lack of funding is the chief instigator of every other challenge that might be faced by the library. The negative impact poor funding has in the work of Libraries expresses itself in different areas and manifest in different dimensions, thus creating additional burden that the library must bear. It is noteworthy that finance is the life wire of every organisation and for a fundamental institution like the library, underfunding it will definitely make it to not live to its full potential. Agreeing to this thought line; Elisha (2006) asserts that without increased funding, all advances such as in human resource development are surely doomed.

Limited Resources to serve the needs of clients

For a library to be functional, it has to meet its user's needs and ensuring that users make functional use of the information resources and services available at their disposal. All activities, resources, and services of the library are geared towards helping the general public to achieve its information needs. However, as important as this library was it has been observed that information resources are not readily available. Opurum and Okwu (2021) assert that most libraries in Nigeria are plagued with out-dated materials and lack the required facilities and resources to satisfy users' needs, which result in inadequate library services, poor academic performance, and poor reading culture which negatively affects national development. They further argue that information resources are not always available in the quality desired. Africa particularly is faced with a problem that researchers have identified as "Book Famine". This means that information resources are scarce. This inadequacy of information resources poses a grave challenge to effective rendering of library services by Nigerian libraries.

Staff Shortages and Low Motivation

Library staffs have a major role to play in the day to day running of the library; they ensure that the library's objectives are met. Every valuable resource that the library offer requires properly trained staff and sufficient funding to maintain it, libraries need staff to shelve books, catalogue e-resources, oversee room reservations, create programs, and even to simply open the front doors on time. Without enough staff, important tasks can't be done on schedule, and some services have to be cancelled. Not having enough staff to handle the volume of use can also lead to burnout, which in turn can increase turnover and reduce efficiency. As demand for services continues to rise while staffing and budgets fall behind, the gap between what patrons want and what libraries can provide will only widen (Triola, 2026).

Lack of Infrastructure

Nigerian libraries lack infrastructures like steady power supply, internet facilities and even adequate number of computers to support automation. Many libraries have installed Internet facility in the past but none of them is functional presently. This has been due to lack of finance to sustain and maintain these facilities. Lack of adequate power supply is one of the problems facing the utilisation ICT in libraries in Nigeria which hampers effective library services. Facilities in the electronic library, reprographic and other units of the library need power supply to function effectively. The absence of power leads to delay in information retrieval and loss of time on the side of the user (Opuru & Okwu, 2021).

Conclusion

The broadsheet has attempted to show the relevance of libraries in enhancing democratic governance and national development in Nigeria. It revealed that there is a linkage between democratic governance and national development;

and that for national development to be more realistic in Nigeria all stake-holders must be allowed to play their role effectively in the democratization process.

The paper also disclosed the indispensable role of libraries in providing the necessary information that would empower citizens to participate in the democratization process which will ensure good governance development in Nigeria. It however, revealed some daunting challenges libraries face in providing effective and efficient information service delivery that would engender democratic governance and national development. Prominent among these are, inadequate funding to procure the relevant information resources, inadequate skilled manpower, lack of effective library cooperation and networking, high rate of illiteracy among library users (citizens), week policy formulation/implementation etc.

Recommendations

Based on the discussion in the paper the following recommendations are proffered

1. Libraries of all kinds should be adequately funded by their parent bodies for improved service delivery, by ensuring that 10% of the library's budget is devoted to improving the services. Alternatively, they could seek for assistance from agencies

(Such as TETFund, foundations and the like) to support their services.

2. Librarians should formulate strong and robust policies that would ensure effective and efficient service delivery to the users/citizens and should strictly effect the implementation of these policies.

3. Interlibrary cooperation/networking should be encouraged among libraries in order to enhance access to information by library users. These would be facilitated through automation of the library functions and services.

4. Skilled manpower with ICT literacy should be employed in libraries of all kinds as this would ensure adequate service delivery to users (citizens). In addition, they should be exposed to regular capacity building programmes to update their knowledge and skills.

5. Libraries should support literacy programmes by not only providing the premises for adult literacy classes but also relevant information resources that enhance literacy.

Abstract

The growing global emphasis on open science has continued to place open data as a critical component of transparent, collaborative, and impactful research. Academic librarians are increasingly expected to support open data practices through research data management, data curation, and scholarly communication services. This study examined the demographic characteristics and knowledge of open data practices among academic librarians in Nigeria, and further determined the relationship between selected demographic variables and their knowledge levels. A correlational survey research design was adopted for the study. The population comprised 125 academic librarians drawn from selected federal universities across Nigeria's six geopolitical zones, using a total enumeration sampling technique. Data were collected through a structured questionnaire and analyzed using descriptive statistics and non-parametric tests, including the Mann–Whitney U test and Kruskal–Wallis H test, at a 0.05 level of significance. The findings revealed that academic librarians possess a moderate to high level of knowledge of open data practices, particularly in relation to general concepts and professional roles. However, gaps were identified in technical areas such as data management planning and licensing. The study further found that gender had no significant relationship with knowledge of open data practices, while academic qualification and years of professional experience showed significant relationships, with higher qualifications and longer experience associated with higher knowledge levels. The study concludes that although academic librarians in Nigeria are conceptually prepared for open data practices, their readiness remains partial due to limitations in technical competencies. It recommends targeted capacity building, strengthened curriculum content, and institutional support to enhance practical engagement with open data.

Keywords: Demographic characteristics, gender, qualification, experience, open data, academic librarians, knowledge, Nigeria

Introduction

The global movement toward open science has increased attention to open data as an essential component of transparent, collaborative, and impactful scholarly communication. Open data refers to the practice of making research data freely accessible for use, reuse, and redistribution with minimal restrictions, thereby promoting verification, innovation, and broader knowledge dissemination (Baro & Eze, 2017; Okechukwu et al., 2024). Within academic institutions, open data practices involve the organized creation, documentation, preservation, sharing, and ethical reuse of research data in ways that enhance research credibility, improve institutional visibility, and maximize the public value of scholarly outputs. As universities increasingly emphasize data driven scholarship and accountability, open data has become a significant area of professional engagement for academic librarians.

Academic librarians occupy a strategic position in higher education because they support teaching, learning, and research through information organization, scholarly communication services, and digital resource management. Their responsibilities now extend beyond traditional library services to include research data management, metadata creation, repository administration, digital preservation, and advocacy for open science initiatives (Nitecki & Davis, 2019; Sugihartati et al., 2025). In this evolving context, academic librarians are expected to guide researchers in data documentation, licensing, ethical compliance, preservation, and dissemination. Their ability to fulfill these responsibilities effectively depends largely on their level of knowledge of open data practices and their capacity to apply such knowledge within institutional systems.

Knowledge of open data practices involves an understanding of concepts such as data lifecycle management, metadata standards, open repositories, data sharing mandates, legal frameworks, ethical considerations, and licensing systems. This knowledge is essential because it shapes librarians' competence in supporting institutional open science goals and assisting researchers with data related services (Okwu & Oladokun, 2023). In Nigeria, academic librarians are increasingly participating in digital scholarship and research support services, yet evidence suggests variations in professional preparedness and institutional support. Adekoya et al. (2024) note that while Nigerian librarians are becoming more involved in research data management services, disparities remain in technical competencies and institutional readiness. This suggests that demographic factors such as educational qualifications, years of experience, gender, and institutional context may influence librarians' exposure to and understanding of open data practices.

Demographic characteristics are important in professional studies because they provide insight into how individual and institutional variables shape knowledge acquisition, access to opportunities, and professional adaptation. Among academic librarians, characteristics such as age, gender, educational attainment, and work experience may influence awareness of emerging scholarly practices, participation in professional development, and responsiveness to technological change. Understanding these characteristics is therefore essential in examining open data practices, particularly in a developing context such as Nigeria where institutional inequalities, uneven infrastructure, and professional capacity gaps may affect librarians differently. Examining demographic characteristics alongside knowledge of open data practices provides a more comprehensive understanding of librarians' preparedness for contemporary data centered roles.

In Nigeria, the academic library system operates within a context shaped by varying levels of technological infrastructure, policy development, funding, and access to professional training. Although awareness of open access and digital scholarship has grown, the transition to open data practices presents additional technical, ethical, and organizational demands (Ajisebutu et al., 2024; Anyaoku & Anike, 2021). Open data requires more than general awareness of openness related initiatives because it involves specialized competencies in data governance, licensing, curation, and preservation. Oyedodun and Adetoro (2024) emphasize that librarians' engagement with emerging digital practices is often shaped by institutional readiness and individual competence. This suggests that the capacity of academic librarians to participate meaningfully in open data practices may be influenced not only by institutional structures but also by their demographic and professional profiles.

Despite increasing global emphasis on open science, empirical studies on open data practices among librarians in Nigeria have focused more on academic librarians, open access resources, or general digital systems, with limited specific attention to academic librarians as a broader professional category. Existing studies have not sufficiently examined how demographic characteristics intersect with librarians' knowledge of open data practices within Nigerian academic institutions. This gap is significant because academic librarians represent a major workforce in higher education and play a central role in institutional research support. Given these concerns, there is a need to examine both the demographic characteristics of academic librarians in Nigeria and their knowledge of open data practices. Such an examination is necessary for understanding patterns of preparedness, identifying professional gaps, and informing policies that strengthen librarians' roles within the expanding open science framework. This study therefore investigates the demographic characteristics and knowledge of open data practices among academic librarians in Nigeria.

Statement of the Problem

The increasing global adoption of open science has positioned open data as an essential mechanism for promoting research transparency, reproducibility, collaboration, and wider dissemination of scholarly outputs. Within academic institutions, academic librarians are expected to play important roles in supporting open data practices through research data management, data curation, repository services, and guidance on ethical and legal data sharing processes. Their effectiveness in these roles depends significantly on their knowledge of open data practices as well as demographic factors that may influence their preparedness for these expanding responsibilities.

In Nigeria, academic libraries are gradually adapting to digital transformation and openness related initiatives, particularly through engagement with open access resources, institutional repositories, and scholarly communication support. However, while studies such as Baro and Eze (2017), Anyaoku and Anike (2021), Ajisebutu et al. (2024), and Adeyemi et al. (2025) and Maxwell and Oladokun (2025) have examined librarians' awareness and perceptions of open access and related digital practices, limited empirical attention has been given specifically to academic librarians' knowledge of open data practices. Existing studies have focused more broadly on research data management, open

access utilization, or research librarians, leaving insufficient understanding of how academic librarians as a wider professional group are positioned within the open data movement.

Furthermore, demographic characteristics such as educational qualifications, years of experience, gender, and professional exposure may shape academic librarians' access to training opportunities, technological competencies, and engagement with open science initiatives. Yet, there is limited evidence on how these demographic variables relate to knowledge of open data practices among academic librarians in Nigeria. This implies that without such evidence, institutions may face challenges in designing targeted professional development programs, implementing effective open data policies, and building sustainable support systems that address specific capacity gaps within the academic library workforce. In addition, this paucity of empirical data creates a significant knowledge gap in understanding whether Nigerian academic librarians possess the required knowledge base to effectively support open data initiatives and whether demographic differences influence such preparedness. This study therefore seeks to address this gap by examining the demographic characteristics and knowledge of open data practices among academic librarians in Nigeria.

Research Objectives

1. To identify the demographic characteristics of academic librarians in Nigeria.
2. To assess the level of knowledge of open data practices among academic librarians in Nigeria.
3. To examine the relationship between demographic characteristics and knowledge of open data practices among academic librarians in Nigeria.

Hypothesis

1. There is no significant relationship between the gender of academic librarians in Nigeria and their knowledge of open data practices.
2. There is no significant relationship between the qualification of academic librarians in Nigeria and their knowledge of open data practices.
3. There is no significant relationship between the years of experience of academic librarians in Nigeria and their knowledge of open data practices.

Literature Review

The increasing global emphasis on open science has positioned open data as an important element of transparent scholarship, research collaboration, and knowledge advancement. Open data promotes the accessibility, reuse, and preservation of research outputs, thereby strengthening scientific credibility and institutional visibility (Ng et al., 2024). Within this context, librarians are increasingly expected to move beyond traditional information management roles toward responsibilities that include research data management, metadata creation, repository administration, and scholarly communication support (Nitecki & Davis, 2019; Sugihartati et al., 2025). This professional shift has made librarians' knowledge of open data practices an essential issue, particularly in academic environments where librarians are expected to support researchers within evolving digital and open science systems.

Studies across different contexts suggest that librarians' preparedness for open data remains uneven despite growing professional expectations. In Nigeria, Alex Nmecha and Onifade (2023) found that librarians often lacked sufficient preparedness for research data management, particularly in policy awareness and technical capacity. Abiodun Asanre et al. (2024) similarly reported that health librarians possessed foundational professional skills but lacked specialized competencies for advanced data management services. Ojo et al. (2024), however, identified relatively higher levels of data curation knowledge among librarians in Southwestern Nigeria, although notable deficiencies remained in metadata standards, preservation practices, and ethical dimensions. These studies suggest that while librarians may possess basic conceptual awareness of data related responsibilities, technical and operational knowledge remains inconsistent.

This pattern is not unique to Nigeria. Milewska et al. (2022) found that researchers and information professionals in Poland demonstrated limited practical understanding of data preparation and sharing despite acknowledging the importance of data management. Akullo and Nsibirwa (2024) similarly observed that Ugandan librarians recognized the value of linked open data but had limited implementation readiness. Okoroma (2023) also noted that Nigerian LIS professionals perceived linked data positively while lacking the technical depth necessary for practical application. Collectively, these findings indicate that librarians' knowledge of open data is often fragmented, with awareness exceeding operational competence.

Related studies on open access and openness related systems further provide insight into librarians' professional orientation toward open practices. Baro and Eze (2017) found that Nigerian academic librarians generally perceived open access positively, though concerns about quality and recognition shaped preferences. Anyaoku and Anike (2021) and Ajisebutu et al. (2024) similarly reported growing awareness and utilization of open access resources among Nigerian librarians, but practical engagement varied depending on institutional support. Adeyemi et al. (2025) also found that librarians perceived open resources as beneficial for research support and sustainability.

Tella et al. (2021) reported positive perceptions of open source systems among academic librarians, though educational background, professional experience, and institutional conditions significantly influenced engagement.

These studies suggest that Nigerian librarians are generally receptive to openness related initiatives, but positive attitudes do not automatically ensure advanced practice.

Direct evidence on open data practices is more limited but increasingly important. Anyaoku (2019) found that Nigerian medical librarians were aware of open data initiatives and held favorable perceptions, yet implementation remained constrained. Adekoya et al. (2024) similarly noted growing involvement of Nigerian librarians in research data management services, while also identifying disparities in competence and institutional preparedness. Most notably, Maxwell and Oladokun (2025) found that research librarians in Nigeria demonstrated moderate to high conceptual knowledge of open data practices and generally positive perceptions of open data. Their study further revealed strong recognition of open data's academic, institutional, and professional benefits, including enhanced research visibility, collaboration, and relevance. However, significant barriers such as inadequate training, limited technological infrastructure, insufficient institutional policies, funding constraints, and legal and ethical concerns were identified. This study is particularly important because it demonstrates that librarians' conceptual readiness and positive disposition alone are insufficient when structural limitations persist.

An important but less explored issue in the literature is the influence of demographic characteristics on librarians' knowledge of open data practices. While several studies imply that variables such as educational background, experience, and professional exposure may shape librarians' competencies (Tella et al., 2021; Ojo et al., 2024), few studies directly examine demographic factors as central variables. This omission is significant because demographic characteristics may influence access to training, adaptability to emerging technologies, and professional engagement with open science practices.

From the review, studies have shown that librarians are increasingly aware of open science and open data practices, and they generally demonstrate positive perceptions toward openness. However, knowledge remains uneven, often stronger at the conceptual level than at the technical or operational level. Existing studies also show that institutional barriers significantly affect implementation. While prior research has examined open access, research data management, and perceptions of openness among librarians, limited attention has been given to how demographic characteristics relate specifically to knowledge of open data practices among academic librarians in Nigeria. This gap justifies the present study, as understanding both demographic characteristics and knowledge levels is essential for designing targeted interventions that strengthen academic librarians' preparedness for open data responsibilities.

Methodology

This study adopted a correlational survey research design. The design was considered most appropriate because it enabled the systematic collection of quantitative data for examining both the demographic characteristics of academic librarians and their level of knowledge of open data practices, while also determining the relationship between the selected demographic variables and knowledge levels. Correlational design is suitable for studies that seek to establish the nature and degree of association between variables without manipulating them, thereby allowing the researcher to examine naturally occurring relationships within a defined population (Ahmad et al. 2019; Shal et al, 2024). In the context of this study, the design was particularly relevant because it provided a framework for investigating whether demographic factors such as gender, educational qualifications, and years of experience were significantly related to librarians' knowledge of open data practices.

The population of the study comprised of one hundred and twenty-five (125) academic librarians drawn from selected federal universities across Nigeria's six geopolitical zones namely university of llorin (22) North- Central; UNN (24), South East, BUK (26),North West, University of Benin, Edo State, (21) South-South, Federal University of Kashere, Gomber(17), North East and federal university Oye-Ekiti (15), South West. The universities were selected through randomized process to give equal chances of been selected based on recognized indicators such as research output, academic performance, and institutional visibility (Oladokun, 2025). Moreover, as this study is quantitative research and given the relatively manageable population size, the study employed probability sampling techniques to identified academic librarians within the selected institutions for the study. This approach ensured broad coverage of the study population and minimized sampling bias.

Data were collected using a structured questionnaire designed to obtain information on respondents' demographic characteristics and their knowledge of open data practices. The demographic section captured variables such as gender, educational qualifications, and years of professional experience, while the knowledge section measured respondents' understanding of open data concepts, repositories, policies, licensing, ethical considerations, and librarians' roles in supporting open data initiatives. All substantive items were measured using a four-point Likert scale ranging from Strongly Disagree (1) to Strongly Agree (4). The absence of a neutral midpoint was intended to encourage clear responses and reduce central tendency bias.

To ensure validity, the instrument was subjected to face and content validation by experts in Library and Information Science and research methodology to confirm clarity, relevance, and adequacy of coverage. A pilot study was also conducted among thirty librarians from three federal universities not included in the main study, namely Federal University of Technology, Ikot Abasi, Federal University of Agriculture, Abeokuta, and Federal University, Lokoja. Reliability was established using Cronbach's alpha, with a coefficient of 0.70 and above considered acceptable for

internal consistency (Adamson & Prion, 2013). The questionnaire was administered electronically through Google Forms to enhance accessibility, geographic reach, and response efficiency across the selected institutions.

A total of 117 valid responses were retrieved from the 125 copies of questionnaire distributed and used for the analysis. Data analysis was conducted using both descriptive and inferential statistics through SPSS version 23. Descriptive statistics including frequency counts, percentages, mean, and standard deviation were used to summarize respondents' demographic characteristics and level of knowledge of open data practices. In interpreting responses to the four point Likert scale, a decision threshold of 2.50 was adopted, where mean scores above 2.50 indicated agreement or higher knowledge, while scores below 2.50 indicated disagreement or lower knowledge (Oladokun, 2025; Oladokun et al., 2025).

For hypothesis testing, non-parametric statistical tests were employed because the demographic variables were categorical and the study sought to examine relationships without assuming normal distribution of the data. Specifically, the Mann Whitney U test was used to determine whether significant differences existed in knowledge levels based on gender, since gender involved two independent groups. The Kruskal Wallis H test was used to examine differences in knowledge levels across educational qualifications and years of experience because these variables involved more than two independent groups. These tests were considered appropriate because they are robust alternatives to parametric tests when dealing with ordinal scale data such as Likert responses and categorical independent variables. The null hypothesis was tested at a 0.05 level of significance.

Ethical considerations were strictly observed throughout the study. Participation was voluntary, and respondents were informed of their right to decline participation or withdraw at any point without penalty. Confidentiality and anonymity were maintained by excluding personally identifiable information from the dataset. All data collected were securely stored and used strictly for academic purposes. In addition, all scholarly sources consulted were appropriately acknowledged to uphold academic integrity and ethical research standards.

Results

Objective 1: To identify the Demographic Characteristics of Academic Librarians in Nigeria.

Understanding the demographic characteristics of respondents involved in the study is essential in research, as it provides insights into the composition of the study population. In this study information was collected based on the gender, age, educational qualification, and years of work experience. These characteristics are presented in Table 1 and serve as a foundation for subsequent analyses.

Table 1: Showing the Demographic Data of Respondents (N = 117)

Category	Frequency (N=117)	Percentage (%)
Gender		
Male	68	58.12
Female	45	38.46
Prefer not to say	4	3.42
Qualifications		
Bachelor's degree	34	29.06
Master's degree	62	52.99
PhD	21	17.95
Years of Work Experience		
Less than 1 year	6	5.13
5 years	29	24.79
6-10 years	38	32.48
11-15 years	24	20.51
16-20 years	13	11.11
Above 20 years	7	5.98

Table 1 presents the demographic characteristics of the respondents who participated in the study. The results show that a higher proportion of the respondents were male (58.12%) compared to female respondents (38.46%), while a small fraction (3.42%) preferred not to disclose their gender. In terms of educational qualifications, the majority of the research librarians possessed a master's degree (52.99%), followed by those with a bachelor's degree (29.06%) and PhD holders (17.95%). This indicates that most respondents were well qualified academically. With respect to years of professional experience, respondents were largely within the 6–10 years category (32.48%), followed by those with 1–5 years (24.79%) and 11–15 years (20.51%) of experience. This distribution suggests that the respondents had considerable professional exposure, making them suitable for providing informed views on open data practices.

Objective 2: To assess the Level of Knowledge of Open Data Practices among Academic Librarians in Nigeria.

This section presents the findings on the level of knowledge of open data practices among academic librarians in Nigeria universities. The analysis was conducted to determine the extent to which librarians are knowledge about various aspects of open data practices, including data sharing, data management, data preservation and use of open data repositories, the result are presented in Table 2 below.

Table 2: Showing Level of knowledge of open data practices among research librarians in Nigeria

S/N	Questionnaire Item	SA	A	D	SD	N	Mean	SD
1.	I understand the concept of open data in the context of research and libraries.	45	50	15	7	117	3.14	0.96
2.	I am familiar with national and international open data policies relevant to libraries.	32	48	25	12	117	2.85	0.94
3.	I know the types of research data that can be shared as open data.	40	46	21	10	117	2.99	0.95
4.	I am aware of open data repositories used for storing and sharing research data.	36	44	26	11	117	2.90	0.95
5.	I understand the licensing options (e.g., Creative Commons) used in open data sharing.	28	42	31	16	117	2.70	0.97
6.	I am knowledgeable about ethical considerations involved in open data practices.	34	47	23	13	117	2.87	0.95
7.	I understand the role of librarians in supporting open data initiatives.	41	49	18	9	117	3.03	0.93
8.	I am familiar with data management plans required for open data sharing.	26	40	34	17	117	2.64	0.98

Table 2 shows the level of knowledge of open data practices among research librarians in Nigeria. The mean scores for the items ranged from 2.64 to 3.14, indicating a moderate to high level of knowledge overall. Respondents demonstrated strong understanding of the general concept of open data (M = 3.14) and the role of librarians in supporting open data initiatives (M = 3.03). However, relatively lower mean scores were recorded for familiarity with data management plans (M = 2.64) and licensing options such as Creative Commons (M = 2.70). These findings suggest that while research librarians are conceptually aware of open data practices, there are notable gaps in technical and procedural aspects, particularly in areas related to licensing and structured data management.

Objective 3: To examine the Relationship between Demographic Characteristics and Knowledge of Open Data practices among Academic Librarians in Nigeria.

Hypotheses testing

H_{01}: There is no significant relationship between the gender of academic librarians in Nigeria and their knowledge of open data practices.

To test the hypothesis on the relationship between demographic characteristics and knowledge of open data practices among academic librarians in Nigerian universities, a correctional analysis was conducted. The analysis sought to determine whether significant relationships exist between the selected demographic variables and the respondents' knowledge of open data practices. The result are presented in Table 3 below.

Table 3: Mann Whitney U Test Showing the Relationship Between Gender and Knowledge of Open Data Practices Among Academic Librarians in Nigeria

Gender	N	Mean Rank	Sum of Ranks	Mann Whitney U	Z	p value
Male	68	60.82	4135.76	1412.500	-0.842	0.400
Female	45	56.39	2537.55			

Table 3 presents the Mann Whitney U test analysis examining the relationship between gender and knowledge of open data practices among academic librarians in Nigeria. The result shows that male librarians (Mean Rank = 60.82) recorded a slightly higher mean rank than female librarians (Mean Rank = 56.39). However, this observed difference

was not statistically significant, as indicated by the Mann Whitney U value of 1412.500, Z = -0.842, and p = 0.400, which is greater than the 0.05 level of significance. This means that gender did not significantly influence academic librarians' knowledge of open data practices. Consequently, the null hypothesis stating that there is no significant relationship between the gender of academic librarians in Nigeria and their knowledge of open data practices was not rejected. This finding suggests that both male and female academic librarians demonstrated comparable levels of knowledge of open data practices, implying that gender may not be a major determinant of librarians' conceptual understanding of open data in the Nigerian academic context.

H_{02}: There is no significant relationship between the qualification of academic librarians in Nigeria and their knowledge of open data practices.

Table 4: Kruskal Wallis H Test Showing the Relationship Between Qualification and Knowledge of Open Data Practices Among Academic Librarians in Nigeria

Qualification	N	Mean Rank	Chi Square (H)	df	p value
Bachelor's Degree	34	47.26	8.624	2	0.013
Master's Degree	62	59.84			
PhD	21	73.91			

Table 4 shows the Kruskal Wallis H test analysis conducted to determine the relationship between academic librarians' qualifications and their knowledge of open data practices. The result indicates variations in mean rank scores across qualification categories, with Bachelor's degree holders recording the lowest mean rank (Mean Rank = 47.26), followed by Master's degree holders (Mean Rank = 59.84), while PhD holders recorded the highest mean rank (Mean Rank = 73.91). The calculated Kruskal Wallis H value of 8.624 with 2 degrees of freedom and a p value of 0.013 indicates that the difference was statistically significant at the 0.05 level. Since the p value is less than 0.05, the null hypothesis was rejected. This implies that academic qualification had a significant relationship with librarians' knowledge of open data practices. The finding suggests that higher educational attainment may contribute positively to librarians' knowledge levels, possibly because advanced academic exposure may provide broader engagement with research processes, digital scholarship, and data management concepts. This outcome highlights the importance of academic advancement and specialized professional education in strengthening librarians' preparedness for open data responsibilities.

H_{03}: There is no significant relationship between the years of experience of academic librarians in Nigeria and their knowledge of open data practices.

Table 5: Kruskal Wallis H Test Showing the Relationship Between Years of Experience and Knowledge of Open Data Practices Among Academic Librarians in Nigeria

Years of Experience	N	Mean Rank	Chi Square (H)	df	p value
Less than 1 year	6	39.50	11.482	5	0.043
1–5 years	29	48.67			
6–10 years	38	58.24			
11–15 years	24	65.83			
16–20 years	13	71.12			
Above 20 years	7	74.36			

Table 5 presents the Kruskal Wallis H test analysis assessing the relationship between years of professional experience and knowledge of open data practices among academic librarians in Nigeria . The results reveal progressive increases in mean rank scores across experience categories, beginning with librarians who had less than one year of experience (Mean Rank = 39.50) and increasing steadily to those with above 20 years of experience (Mean Rank = 74.36). The Kruskal Wallis H value of 11.482 with 5 degrees of freedom and a p value of 0.043 indicates that the observed differences were statistically significant at the 0.05 level. Since p is less than 0.05, the null hypothesis was

rejected. This finding indicates that years of professional experience significantly influenced academic librarians' knowledge of open data practices. Specifically, librarians with more years of experience tended to demonstrate higher knowledge levels than those with fewer years of experience. This may be attributed to prolonged professional exposure, increased opportunities for training, and broader interaction with evolving scholarly communication practices over time. The result suggests that experience may play an important role in shaping librarians' familiarity with open data concepts and their capacity to engage effectively in data related services.

Discussion of the Findings

The findings reveal that academic librarians in Nigeria possess a moderate to high level of knowledge of open data practices, particularly in relation to general concepts such as the meaning of open data and the professional role of librarians in supporting open data initiatives. This suggests that librarians are already integrated into the broader discourse of open science and are aware of their evolving responsibilities within the research lifecycle. This finding is consistent with Maxwell and Oladokun (2025), who reported that research librarians in Nigeria demonstrate moderate to high conceptual knowledge of open data practices. Similarly, Adekoya et al. (2024) found increasing involvement of librarians in research data management services, indicating growing familiarity with data-related responsibilities in Nigerian academic institutions.

However, a deeper interrogation of the findings shows that librarians' knowledge is not uniformly distributed across all aspects of open data practices. While understanding of general concepts appears strong, knowledge is relatively weaker in technical areas such as data management planning and licensing frameworks. This distinction is critical because these areas represent the operational foundation of open data implementation. The finding therefore indicates that librarians' preparedness is largely conceptual rather than technical. This outcome supports the findings of Alex-Nmecha and Onifade (2023), who observed that librarians in Nigeria often lack adequate technical preparedness for research data management despite being aware of its importance. In the same vein, Abiodun-Asanre et al. (2024) reported that although librarians possess foundational knowledge, they lack advanced competencies necessary for effective data services. The convergence of these findings suggests a persistent knowledge–practice gap, where awareness does not translate into practical capability.

The demographic characteristics of the respondents provide important context for understanding this pattern. With respect to gender, the findings indicate that there is no significant relationship between gender and knowledge of open data practices. This implies that male and female librarians demonstrate comparable levels of knowledge. This finding aligns with Tella et al. (2021), who found that demographic variables such as gender do not significantly influence librarians' engagement with technological systems, while institutional and professional factors play a more significant role. The implication is that knowledge of open data is not shaped by gender differences but by access to training, exposure, and professional opportunities. This also suggests that interventions aimed at improving open data competencies should be inclusive and broadly targeted rather than gender-specific.

In contrast, the findings show that academic qualification has a significant relationship with knowledge of open data practices, with higher qualifications corresponding to higher levels of knowledge. This result is expected, as advanced academic qualifications typically involve deeper engagement with research processes, scholarly communication, and data-related activities. This finding is consistent with Ojo et al. (2024), who reported that librarians with stronger academic backgrounds demonstrated better understanding of data curation and management practices. Similarly, Adekoya et al. (2024) emphasized that educational exposure enhances librarians' capacity to engage effectively with research data services. Nevertheless, this finding also raises an important concern. Although higher qualifications improve knowledge, they do not completely eliminate the technical deficiencies observed in areas such as licensing and data management planning. This suggests that formal academic training may emphasize theoretical knowledge more than practical competencies, thereby contributing to the imbalance between conceptual awareness and operational expertise.

Furthermore, the findings reveal that years of professional experience significantly influence librarians' knowledge of open data practices, with more experienced librarians demonstrating higher levels of knowledge. This indicates that knowledge development in this area is cumulative and shaped by prolonged engagement in professional activities. This finding supports Ahmad et al. (2019), who argued that professional experience enhances librarians' ability to develop competencies in emerging and data-driven services. However, similar to the case of academic qualification, the influence of experience appears to be more pronounced in general understanding than in specialized technical skills. If experience alone were sufficient, one would expect high competence across all dimensions of open data practices. The observed gaps therefore suggest that professional experience in the current context may be largely informal and not systematically structured to build advanced data competencies. This points to the need for deliberate and continuous professional development programs that focus specifically on technical aspects of open data.

Conclusion

This study examined the demographic characteristics and knowledge of open data practices among academic librarians in Nigeria, as well as the relationship between selected demographic variables and knowledge levels. It was

motivated by the growing importance of knowledge management in academic libraries, where librarians are expected to support teaching, learning and research through effective knowledge creation, organization, sharing and application.

Findings revealed that academic librarians are engaged in knowledge management practices, although the level of involvement varies among individuals. Demographic characteristics such as educational qualification, years of experience, and age were found to influence these practices, with more qualified and experienced librarians showing higher levels of engagement.

The study also showed that knowledge management practices are not determined by demographic factors alone, as institutional support, ICT infrastructure, training opportunities, and organizational culture also play significant roles. This highlights the need for a supportive work environment to enhance effectiveness.

In conclusion, while demographic characteristics influence knowledge management practices among academic librarians in Nigerian universities, improvements depend largely on continuous training, adequate ICT facilities, and supportive institutional policies. The study contributes to existing literature and provides insights for strengthening knowledge management in academic libraries in Nigeria.

Recommendations

Based on the findings of this study, the following recommendations are derived:

1. Academic librarians should engage in targeted professional development programs focused on technical competencies in open data practices. Given the identified gaps in areas such as data management planning and licensing, librarians should prioritize continuous learning through workshops, certifications, and hands-on training that emphasize practical skills rather than only conceptual understanding.
2. University management and library administrators should institutionalize structured training and capacity-building initiatives on open data. Since knowledge levels are influenced by educational exposure and experience, institutions should provide regular, organized training programs, mentorship opportunities, and in-house seminars that equip librarians with the technical and operational skills required for effective open data implementation.
3. Library and Information Science (LIS) schools should strengthen curriculum content to include practical components of open data and research data management. Considering that higher academic qualifications significantly enhance knowledge, LIS programs should go beyond theory to incorporate experiential learning, including data curation, licensing, repository management, and real-world data handling practices.
4. Professional bodies and policymakers should develop and promote standardized frameworks and guidelines for open data practices in academic libraries. To complement the influence of experience and education, there is a need for clear national and institutional guidelines that define competencies, best practices, and operational standards, thereby supporting librarians in translating knowledge into effective practice.
5.

Limitations and Suggestions for Further Studies

This study provides useful insights into the knowledge of open data practices among academic librarians in Nigeria; however, certain limitations should be acknowledged. First, the study relied on a quantitative survey design using self-reported data, which may not fully reflect the actual competencies of respondents. Librarians may have indicated familiarity with open data concepts without necessarily possessing the practical skills required for implementation. As such, the findings largely capture perceived knowledge rather than demonstrated expertise.

Librarians in state universities, private institutions, research institutes, and other information environments may operate under different conditions, particularly in terms of access to infrastructure, training opportunities, and institutional support for open data practices. Third, while the study examined the relationship between selected demographic variables and knowledge, it did not explore other potentially influential factors such as institutional policies, availability of training programs, technological infrastructure, and organizational support systems, which may significantly shape librarians' engagement with open data practices.

In view of these limitations, future research should adopt mixed-methods or qualitative approaches, such as interviews or case studies, to provide deeper insights into librarians' actual competencies and experiences with open data practices. Further studies should also expand the scope to include a wider range of institutions, enabling broader comparison across different academic and research environments. Additionally, future research could investigate the impact of institutional factors and professional development interventions on librarians' practical engagement with open data. Longitudinal studies may also be conducted to examine how librarians' knowledge and competencies evolve over time in response to training, policy changes, and advancements in open science.

Abstract

This study examined digital contents innovation as correlates of librarians' job performance in academic libraries in Delta State. The purpose of the study was to determine the relationship between the use of digital contents and librarians' job performance in academic libraries in Delta State. The study was guided by one research question and one hypothesis. It adopted a correlational survey design and the instrument for data collection was 137 copies of questionnaire; the population consist all the librarians in academic libraries in Delta State. The data was analyzed using Pearson correlation techniques and ANOVA; the regression analyses were employed to determine the relationship between digital contents and librarians' job performance. The findings from regression analyses revealed statistically significant positive relationships between digital contents and job performance. The use of digital contents revealed ($R = 0.487$, $p = 0.009$) which explained 23.7% of the variation, highlighting its impact on service quality and efficiency. The null hypothesis was rejected based on statistically significant ANOVA result ($p < 0.05$), confirming that digital contents innovation has a significant impact on librarians' job performance. It was concluded that digital contents innovation improved job performance among academic librarians. The study recommended that Library Management should implement the use of digital contents as efficient innovation because they contribute to quality service that translates to efficient job performance.

Keywords: Digital contents, Librarians' job performance, Innovations & Academic libraries

Introduction

Job performance indicates how an individual fulfills established organizational objectives through their competencies. Job performance is a significant factor in an organization. The notion of job performance elucidates how an individual executes various responsibilities delegated by their organization. (Chinemerem et al 2021). This indicates that it encompasses work-related behaviours that may be evaluated at both in1dividual and organizational levels. Job performance is crucial for the success of both the employer and the individual inside the organization. According to Anwar et al. (2022) statement on job effectiveness, an employee's performance is determined by their ability, effort, and comprehension of the ability to carry out their role expectations. This indicates that although effort is a major motivator, a person's ability and how they understand their job responsibilities have a big effect on how effective they are at their job overall. This indicates that job performance involves the execution of mandated responsibilities according to employees' areas of expertise, aimed at achieving the organization's goals and objectives. The work effort that employees exert on the job pertains to the energy expended in task execution. Library job performance is focused on fulfilling users' information needs. **The performance of librarians can be viewed in terms of competencies and skills librarians should possess and demonstrate in discharging their duties. Librarian's competencies and skills will include practical skills, cognitive abilities and other general skills. The competencies and ability required are directed toward the job performed by the librarian. Therefore, the library as an organisation places emphasis on job performance in order to encourage effectiveness and efficiency to fulfil obligations and tasks in the library. Many organizations including libraries anticipate meeting their stated objectives through effective performance on the job (Victoria, 2020). According to Nwokike (2018), the expectations of librarians' job performance are predicated on their work-related behaviours; hence the need for the acquisition of skills that would enhance their competences on the job demands and serves as a criterion for staff promotion.**

Academic Libraries are libraries situated within an academic institution to serve educational purposes. Okonkwo et al; (2022) defined Academic libraries as support pillars for the teaching, learning, research, and leisure needs of academic institutions (universities, polytechnics, colleges, and monotechnics) above the secondary school level. Serving the information needs of the parent institution, which include the teachers, staff, students, and the surrounding community. This has been supported by many researchers as the main duty of the library; because it helps students and researchers acquire skills to unlock the academic resources of the library for their information needs, as they identify reference and communicate the retrieved information. (Orakpor, et al. 2025). Academic libraries as seen by Orakpor and Ezekwibe, (2025) are a confidence center of educational establishments and their services assist numerous academic programs, including teaching and research. In academic libraries, the application of the latest technology, particularly internet technology, has transformed traditional methods of providing library and information services; hence it calls for digital contents innovation.

Digital content refers to any information that is stored, transmitted, or consumed in a digital format. This includes text, images, audio, video, and multimedia materials distributed through digital platforms such as websites, social media, and mobile applications. The use of digital content has transformed communication, education, marketing, and entertainment, enabling greater accessibility, interactivity, and personalization. Shkurti (2025) highlights that digital media enhances teaching by offering diverse content formats and promoting learner engagement through interactive technologies. In academic libraries, digital content refers to electronic resources such as e-books, online journals, databases, and multimedia materials that support research, teaching, and learning. The effective use of digital content enhances access to scholarly materials, enables remote learning, and supports modern academic practices; for librarians these are functions that be carried out for librarians to play effective role as library workers. Librarians play key role in managing, organizing, and facilitating access to digital content. Their job performance is increasingly measured by their ability to integrate digital tools, provide user education, and support digital literacy (Orakpor et.al, 2020). Thus, the use of digital contents not only enhance academic library services but also reshape the roles and performance expectations of librarians as they aspire to innovate technological way for effective job performance in their service delivery. Innovations in academic libraries are paramount to the growth of the libraries because, with the advancement in technology and innovation, the libraries need to advance its operation from the analog system to the digital system of operation. Very few institutions within the country seem to have advanced by using digital form of operations in their libraries for cataloguing and classification, registration of users, accessing of the libraries from different locations. It is against this background that the study centered on ; Digital Contents Innovations as Correlates of Librarians' Job Performance in Academic Libraries in Delta State.

Statement of the Problem

High level of development in academic libraries have been linked to digital innovations; which have impacted on the field of education as innovative procedures, which have had an impact on research and academic activities in Academic libraries. In order to attract students, academic communities, administrators, and researchers to support the teaching, learning, and research programs, it is vital that academic libraries embrace new trends in order to create positive job performance and attractive library service delivery among librarians.

In fact, from the researcher's observations, perhaps there are challenges to digital contents innovation in academic library employees' effort and initiative to perform their job adequately. This could range from time factor, inability to work with team, communication barriers, resource constraints and technological limitations amongst others and may hinder the job performance of librarians.

Despite the importance of digital contents innovations for enhancing library services delivery, there is limited understanding about how digital contents innovations specifically, impact the job performance of librarians. The other researches highlighted factors such as leadership styles, emerging technologies, collaboration, and technological change but lacks comprehensive insight into digital contents innovation as a correlate of the job performance of librarians in Academic libraries in Delta State. This gap informed the study on whether digital contents innovations can serve as a correlate or determinant of librarians' job performance, potentially offering new strategies to improve productivity and service quality in academic libraries across Delta State.

Objective of the study

The main objective of this study was to examine digital contents innovations as correlate of librarians' job performance in academic libraries in Delta State; specifically, the study sought to determine:

1. The relationship between use of digital contents and librarians' job performance in academic libraries in Delta State.

Research questions

The study was guided by the research question below:

1. What is the relationship between use of digital contents and librarians' job performance in academic libraries in Delta State?

Hypotheses

The following null hypothesis was tested at 05 level of significance:

2. **H_1:** There is no significant relationship between the use of digital contents and librarians' job performance in academic libraries in Delta State.

Review of Literature

The literature review was carried out under the following sub-headings: Innovation, librarians' job performance and use of digital contents

Innovation

Innovation can mean different things to different people. Thais et al. (2024) defined innovation as fundamentally connected to economic progress and social development, becoming a vital pillar of advancement especially, amid the swift technological changes of the modern age. In today's fast-evolving digital world, where change occurs at an extraordinary rate, organizations that prioritize innovation are not just managing to cope they are flourishing in intensely competitive markets. It is widely acknowledged that innovation plays a crucial role in determining success, acting as a major force behind an organization's resilience and capacity to adapt

Innovation in libraries and information centers has become imperative due to the technological revolution and prolific growth of electronic information of late (Fagbemiro et al., 2022). Oyedokun, et.al (2018) opined that due to dramatic changes in the information environment and the ICT sector, library managers have interest not only to adapt to these sweeping changes, but, more importantly to trigger innovative ideas from their personnel with a view to remain at the frontiers of knowledge rather than mere passive observers. Technology can be used creatively in service delivery by means of the mobile phone. For instance, some libraries have adopted this tool to send overdue reminders to patrons for the late return of library materials whereas others use this for current awareness. While technology is definitely part of the solution, there is no reason to over glorify technology and overlook the human resource behind the technological revolution, (Cruz et al., 2020); hence the essence of delving into the jb performance of librarians.

Librarians Job Performance

Librarians' job performance refers to the effectiveness and efficiency with which librarians perform their duties which include maintaining and organizing library materials, helping patrons, facilitating information access, and meeting community and educational needs. The concept of librarians' job performance are used in various studies; for instance, Adeniyi (2024) defines librarians' job performance as the effectiveness with which library staff fulfill their duties, including information dissemination, user assistance, and resource management, contributing to the overall goals of the institution that established them.

Other authors like Posigha, and Idiedo, (2022) describe job performance as the degree to which librarians achieve set objectives through effective service delivery, resource organization, and user engagement. They emphasize the role of self-efficacy and motivation in enhancing performance. Omali and Echedom (2024) definess job performance as the outcome of librarians' efforts in providing quality services, maintaining organized collections, and facilitating access to information, all influenced by the physical and psychosocial work environment. In line with the same definition, Basahuwa, et al.(2020) define job performance as the proficiency with which librarians utilize ICT tools to manage information resources, support users, and streamline library operations, highlighting the significance of ICT competencies.

Two main types of performance are widely used in related studies: in-role performance and innovation performance. In-role performance refers to the work behaviour required to be carried out in the job description of employees; the in-role performance of employees will be authorized, evaluated and rewarded by the organization. Innovation performance, meanwhile, refers to the behavioural process by which individuals, work teams, and organizations engage in the generation, promotion, and conversion of new ideas into practical applications of individuals, work teams and organizations about the generation, promotion and conversion of new ideas into practical application, which can benefit individuals, work teams and organizations (Prakash and Janardhana, 2017; Chen and Kao, 2021). Job performance consists of a set of employees' behaviours that are perceived to be in agreement with organizational goals that can be measured, monitored and assessed as an achievement at an individual level. The librarians' job performance is that aspect of work behaviour that is of relevance to the library's success.

Use of Digital Contents and Librarians' Job Performance in Academic Libraries

Globalization, digitalization, and continuous technological advancements have posed significant challenges to libraries worldwide. These developments have led to the emergence of digital and virtual libraries, online conferences, e-learning, automated library systems, and the integration of Web 2.0 and Library 2.0 tools. The widespread influence of digital technology has revolutionized the way information is stored, transmitted, and accessed, reshaping communication, historical documentation, and knowledge sharing. Libraries, as repositories of knowledge, preserve and provide access to society's collective wisdom through various formats. Academic libraries are instrumental in supporting the teaching, learning, and research objectives of their institutions, thereby contributing to national development (Agim and Azolo, 2019; Adebayo, and Adeola, 2018).

Libraries empower users by guiding them in locating, interpreting, and applying relevant information, which promotes lifelong learning, literacy, informed citizenship, creativity, independent inquiry, and critical thinking. These goals are achieved largely through the adoption of advanced technologies. Universities, as centers of higher learning, are tasked with producing skilled graduates across disciplines to drive national progress. They are expected to constantly evolve their programs to meet changing manpower demands. The university library, often called the university's intellectual hub, plays a crucial role in fulfilling academic goals by providing resources and services that address the information needs of the university community.

As integral components of the university system, libraries cater for students, academic staff, and administrative personnel. Fajonyomi (2021) notes that librarians and library officers deliver information services that support education and research through skills in collection management, technical services, and user education. Each public university in Nigeria typically has a university library headed by a professional librarian, supported by qualified staff. These professionals assist users across disciplines, carrying out roles such as planning, coordinating, budgeting, and evaluating library functions while applying expert knowledge to problem-solving using technological innovations.

Technological advances have transformed library services in universities, expanding them beyond traditional print formats. These technologies enhance processes like information discovery, access, circulation, and organization, while also improving the acquisition and cataloguing of materials (Agim and Azolo, 2019). Libraries now serve as strategic providers of information in various formats, supporting academic functions through the timely provision of relevant materials; which demands their being digitally literate to be able to apply the use of digital contents. (Edewor et al., 2016; Adewoyin et al., 2017).

Shannon (2017) defines digital literacy as the ability to locate, evaluate, share, and create content using digital technologies and the internet. A digitally literate person critically assesses and effectively uses credible online sources. The shift in educational practices due to ICT advancements has made digital literacy an essential skill in today's learning environments and librarians are expected to embrace the advances in the discharge of their duties.

The ability of academic librarians to harness digital tools in the 21st century depends heavily on their digital competencies. Unfortunately, studies reveal that many Nigerian librarians lack these vital digital skills (Atkinson., 2019; Agim and Azolo, 2019). Many are unable to perform basic computer operations, manage emails, navigate the internet, or deliver services using technological tools, which affects their job performance. This gap in skills can be attributed to the lack of digital infrastructure in university libraries. Aina (2019) highlighted key issues facing Nigerian academic libraries, such as the absence of functional e-libraries and adequately trained personnel. The failure to automate many university libraries negatively affects service quality and librarian productivity. observations and past studies (Basahuwa et al., 2020).All these point to declining performance among librarians, often resulting in user dissatisfaction and the tendency of users to seek alternative information sources.

Methodology

The research design for this study was correlational research design. Correlational research is a non-experimental design that seeks to explore the relationship between two or more variables by using survey methods to collect data, with the primary objective of determining the extent to which variables are related (Pallant, 2020). The choice for this design is relevant and appropriate because it establishes the relationship between digital contents innovations and librarians' job performance in academic libraries in Delta State Nigeria. The area of study was in Delta State. Delta State is located in the southern region of Nigeria, is a diverse and vibrant state known for its rich cultural heritage, natural resources, and educational institutions.

The population of this study consists of 137 librarians in all academic libraries in Delta State, Nigeria. The sample size for this study was 137 academic librarians, which is the entire population of librarians from the academic libraries in Delta State, Nigeria. This decision was made based on the manageable size of the population. The data was analyzed using Pearson correlation techniques and ANOVA; the regression analyses were employed to determine the relationship between digital contents and librarians' job performance.

Results and Analysis of Data

Research Question 1: What is the relationship between use of digital contents and librarians' job performance in academic libraries in Delta State?

Table 1

Regression Analysis on Relationship Between Digital Content Use and Librarians' Job Performance

Model	R	R^2	Adjusted R^2	Unstandardized Coefficients (b)	Std. Error	Decision
Constant	.487[a]	.237	.229	52.314	11.876	positive relationship
Digital Content Use				.319		

a. Predictors: (Constant), Digital Contents Innovation Use

The results in Table 1 show a moderate positive relationship between the use of digital content and librarians' job performance. The correlation coefficient (R = 0.487) indicates that increased access to and integration of digital resources enhances job performance. The R^2 value of 0.237 reveals that 23.7% of the variation in performance is attributable to digital content use; with a coefficient of b = 52.314, this shows that for each unit there is increase in the use of digital content, job performance increases by approximately 52.31 units. These results reinforce the contribution of digital content to improved service delivery and productivity in academic libraries.

Hypotheses

Hypothesis 1: There is no significant relationship between use of digital contents and librarians' job performance in academic libraries in Delta State.

Table 2

ANOVA on Significance of Relationship Between Digital Contents Innovation Use and Librarians' Job Performance

Model	Sum of Squares	Df	Mean Square	F	Sig.
1 Regression	1034.281	1	1034.281	7.048	.009[b]
Residual	14523.764	99	146.697		
Total	15558.045	100			

a. Dependent Variable: Job Performance

b. Predictors: (Constant), Digital Contents Innovation Use

The results in Table 2 reveals a significant relationship between the use of digital contents innovation and librarians' job performance (F = 7.048, p = .009). As the p-value is less than 0.05, the null hypothesis is rejected. This shows that digital content plays a critical role in enhancing librarians' service delivery, confidence, and efficiency. Therefore, there is a significant relationship between use of digital contents innovation and librarians' job performance in academic libraries in Delta State.

Discussion of the Findings

The findings of the study are discussed as follow:

Digital Content and Librarians' Job Performance

This study revealed a significant relationship between the use of digital content and librarians' job performance. Librarians who made extensive use of e-resources, such as electronic books, online journals, and multimedia learning tools, were more efficient and effective in their daily responsibilities. A probable reason for this relationship is that digital content enables faster and more comprehensive access to information, thereby improving the quality of reference services, research support, and information literacy instruction. Additionally, digital content supports creativity and innovation in service delivery, helping librarians better meet the needs of their institutions and users.

This finding is consistent with Aliyu and Mohammed (2018), who found that digital content availability significantly improved information service delivery among academic librarians in Northern Nigeria. Similarly, Etim and Udoh (2021) reported that librarians who regularly used digital resources demonstrated higher levels of competence and responsiveness to academic community needs. Akporhonor and Onoriode (2022) also showed that the availability of digital resources improved librarians' creativity and facilitated innovative methods in delivering library services. Balogun and Ogunmodede (2024) further emphasized that digital repository integration positively influenced collection development and research support roles among academic librarians in Nigerian federal universities.

Conclusion

Based on the findings, the study concludes that digital contents innovation play pivotal role in enhancing librarians' job performance in academic libraries in Delta State. The study showed a significant and positive relationship with performance outcomes. Digital contents innovations were found to support continuous professional development and boost librarians' ability to deliver user-centered services. The use of digital contents improved research support, reference services, and general responsiveness to user needs. It enhanced the organization, classification, and retrieval of library resources, thereby strengthening cataloging efficiency and digital access. In essence, the study concludes that librarians' job performance is significantly influenced by their engagement with digital content.

Recommendations

Based on the findings and conclusion reached, the study recommended the following:

1. Library Management should implement the use of digital contents as efficient innovation because they contribute to quality service that translates to efficient job performance.

2. Library Management should implement the use of digital contents because they enable innovative collaboration, adaptability, and efficiency.

3. They should expand access to digital contents in order to help librarians to improve their library service delivery.

4. Universities and library boards should invest in broadening access to high-quality digital resources. Subscription to e-journals, e-books, and multimedia learning tools should be prioritized to support effective research and information service delivery. Moreover, workshops and certification programs should be organized regularly to improve librarians' competencies in digital contents and database navigation.

Abstract

The growing adoption of electronic information resources in higher education has increased the need for lecturers to possess adequate digital literacy and Information and Communication Technology (ICT) proficiency to effectively access and utilize these resources. This study examined digital literacy and ICT proficiency on the utilization of electronic information resources among lecturers at Kwara State Polytechnic, Ilorin. A descriptive survey research design was employed for the study. The study population comprised lecturers of the Polytechnic, while a purposive sampling technique was used to select the Institute of Information and Communication Technology from the six institutes in the polytechnic because of its relevance to the study objectives. The institute had a total of 53 lecturers, all of whom constituted the study sample. Data were collected using a structured questionnaire. Of the 53 questionnaires administered, 41 were duly completed and returned, yielding a response rate of 77.4%. The collected data were analyzed using descriptive statistics, including frequencies, percentages, and mean scores. The findings revealed that the lecturers possessed a moderate level of digital literacy and ICT proficiency. They demonstrated greater competence in basic digital skills and routine ICT operations than in advanced competencies such as searching academic databases, creating digital content, utilizing cloud computing technologies, and applying specialized digital research tools. The study also found that the overall utilization of electronic information resources was moderate. E-journals, e-books, and digital repositories were the most frequently used resources, whereas subscription-based academic databases recorded comparatively lower levels of utilization. Furthermore, the study identified several challenges affecting effective utilization of electronic resources, including inadequate awareness of available electronic resources, limited access to subscription databases, insufficient ICT training, and difficulties in navigating electronic resource interfaces. The study concluded that digital literacy and ICT proficiency are pivotal to lecturers' effective utilization of electronic information resources. It recommended regular digital literacy and ICT capacity-building programmes for lecturers, increased awareness and user education on available electronic resources, improved institutional access to subscription-based databases, and enhanced technical support to facilitate effective utilization of electronic resources. Implementing these measures will strengthen teaching, research, and academic productivity within Kwara State Polytechnic and similar higher education institutions.

Keywords: Digital literacy, ICT proficiency, electronic information resources, electronic resource utilization, lecturers, Kwara State.

Introduction

The rapid advancement of Information and Communication Technology (ICT) and digital technology has fundamentally transformed the way information is created, accessed, stored, and disseminated across educational institutions worldwide. According to UNESCO (2021), digital technologies serve as essential enablers of knowledge creation, scholarly communication, and institutional efficiency in modern education systems. Similarly, Adebayo and Ibrahim (2016) argue that the integration of ICT tools into academic environments has expanded the range of electronic information resources available to lecturers, thereby enriching teaching and research activities. In contemporary academic environments, electronic resources such as e-journals, online databases, e-books, digital repositories, open educational resources, and academic search platforms have become indispensable tools for scholarly communication and knowledge creation. Ilori, Okoro and Abayomi (2022) affirm that the shift from print to digital information systems has improved the speed, flexibility, and depth with which academic staff retrieve and utilize scholarly materials. Mawere and Sai (2018) stated that electronic resources play a crucial role in enhancing academic productivity by providing access to current information, improving teaching methodologies, and supporting high-quality research. Furthermore, Ukwoma and Echezona (2017) emphasize that the availability of digital databases, institutional repositories, and online scholarly platforms has redefined how lecturers' source, retrieve, and utilize academic information. These resources offer lecturers rapid access to current information, support evidence-based teaching, and enhance research productivity. However, as institutions increasingly shift toward digital and hybrid modes of knowledge delivery, the ability of lecturers to effectively utilize electronic resources has become a key indicator of academic quality and institutional competitiveness.

Central to this digital transformation is the role of digital literacy and ICT proficiency, which is important to how effectively lecturers navigate, evaluate, and utilize digital information systems. Digital literacy extends beyond basic computer skills to include information searching, online communication, critical evaluation, and ethical use of digital content. According to Musa (2025), digital literacy entails not only basic computer operation but also the ability to locate, evaluate, and critically use digital information. Also, Eshet-Alkalai (2018) explains that digital literacy extends beyond basic technical skills to include higher-order cognitive abilities such as information evaluation, ethical use of digital content, and problem-solving in technology-rich environments. ICT proficiency on the hand, refers to the technical skills required to operate digital devices, manage digital files, use productivity software, and interact with online academic platforms. Anyim (2018) stated that ICT competences encompass the knowledge and skills required to navigate and utilize digital tools for academic and professional purposes. Similarly, Agyekum and Brempong (2020) stated that ICT proficiency involves mastery of computer operations, software applications, online platforms, and digital communication tools that support academic work. According to Aina and Akpojotor (2019), lecturers who possess advanced digital literacy and ICT skills are more capable of effectively engaging with electronic databases, digital libraries, and online research platforms to support both teaching and scholarly work. This evidence highlights the critical need to investigate the extent to which digital literacy and ICT competencies shape the utilization of electronic resources in polytechnic settings.

In Nigeria, polytechnics have increasingly adopted electronic information systems as part of national efforts to upgrade the quality of technical and vocational education. Kwara State Polytechnic, Ilorin, provides access to electronic databases and digital library services to support lecturers' instructional and research needs. Despite these investments, observational evidence suggests that the utilization of electronic resources among Kwara State Polytechnic lecturers may be below expected levels, potentially due to gaps in digital literacy, ICT proficiency, awareness, and access conditions such as internet reliability. Previous studies in Nigeria have largely focused on universities, librarians, or students, with limited attention given specifically to lecturers in polytechnics even though they constitute a critical group responsible for knowledge transmission, curriculum development, and research innovation. Considering the pivotal role of lecturers in advancing institutional academic objectives, it is crucial to understand the factors that influence their utilization of electronic resources. This study therefore investigates digital literacy and ICT proficiency as determinants of electronic resources utilization among lecturers in Kwara State Polytechnic, Ilorin. However, by examining the predictive influence of these competencies, the study seeks to provide evidence that can inform digital capacity-building initiatives, institutional ICT policies, and strategies for optimizing electronic resources usage within polytechnic environments.

Research Questions

The following research questions were set out to guide the course of this study:

1. What is the level of digital literacy among lecturers in Kwara State Polytechnic, Ilorin, Nigeria?
2. What is the level of ICT proficiency possessed by lecturers in Kwara State Polytechnic, Ilorin, Nigeria?
3. What is the extent to which lecturers utilize electronic resources in Kwara State Polytechnic, Ilorin, Nigeria? and
4. What are the challenges affecting the utilization of electronic resources by lecturers in Kwara State Polytechnic, Ilorin, Nigeria?

Literature Review

The advancement of information and communication technologies (ICTs) has transformed how information is created, accessed, and utilized in higher institutions of learning. Lecturers are increasingly required to possess digital literacy and ICT proficiency to effectively engage with electronic resources for teaching, research, and professional development. Electronic resources refer to digital information materials that can be accessed electronically, usually via the internet or institutional intranet. These include e-books, online journals, databases, multimedia learning materials, and institutional repositories. Adeniran (2020) defines e-resources as digital sources that provide users with convenient and efficient access to scholarly information without physical boundaries and further stated that utilization of e-resources enhances access to current information and promotes academic productivity. Electronic resources such as e-books, online journals, databases, and institutional repositories have become vital tools for academic productivity and knowledge dissemination. Ogbemudia and Okoduwa (2023) stated that the utilization of electronic resources by lecturers is influenced by several factors, including digital literacy, ICT proficiency, access to reliable internet, awareness of available e-resources, and institutional support. When effectively used, electronic resources enhance lecturers' research productivity, improve instructional delivery, and foster global academic engagement.

Digital literacy is a multifaceted concept that refers to an individual's ability to locate, evaluate, utilize, and create information using digital technologies. According to International Federation of Library Associations and Institutions (IFLA, 2017), digital literacy is the capacity to confidently and critically engage with digital tools and resources for learning, work, and participation in society. Similarly, Gilster (2017) describes digital literacy as the ability to understand and use information in multiple formats from a wide range of digital sources. Digital literacy refers to the ability to effectively find, evaluate, use, and communicate information through digital platforms. However, for lecturers in higher institutions, digital literacy extends beyond the mere ability to operate computers; it includes the capacity to critically assess digital content, manage data effectively, use online platforms for teaching and research, and engage in scholarly communication through digital means. Rahman and Ameen (2023) stated that digital literacy is essential for academic staff to effectively access and utilize electronic resources, enhance pedagogical delivery, and contribute to research productivity. Digital literacy involves competencies such as online searching, data management, and ethical use of digital content. Studies (e.g., Gilster, 2017; Rahman & Ameen, 2023) highlight digital literacy as a prerequisite for efficient use of electronic academic resources. Iyanda, Ajayi and Lawal (2016) emphasized that digital literacy significantly influences the ability of educators to access and use electronic academic materials effectively.

ICT proficiency on the other hand, refers to the ability to effectively apply ICT tools, applications, and systems in performing professional tasks. It includes computer operation, use of productivity software (e.g., MS Office, data analysis tools), internet navigation, and digital communication. According to the International Society for Technology in Education (ISTE, 2016), ICT competence encompasses the skills required to use digital tools purposefully to enhance productivity, communication, collaboration, and problem-solving. Similarly, the United Nations Educational, Scientific and Cultural Organization (UNESCO, 2018) describes ICT proficiency as the capacity to utilize a range of technological tools such as computers, software applications, online platforms, and digital communication systems to support teaching, learning, and administrative activities. ICT proficiency represents the skill level and confidence in using ICT tools, including computers, databases, and communication platforms, for academic and administrative functions. Oye, Salleh, and Iahad (2021) observed that lecturers with higher ICT proficiency tend to integrate technology more effectively into their teaching and research processes. Further stated that ICT proficiency plays a critical role in shaping lecturers' engagement with digital technologies for teaching, research, and collaboration. Also, Adeleke and Olorunsola (2022) stated that lecturers with high ICT proficiency are more capable of integrating technology into their instructional activities, accessing digital academic content, and managing electronic communication effectively.

However, the extent to which lecturers can utilize these resources depends largely on their digital literacy and ICT competence. In many Nigerian polytechnics, including Kwara State Polytechnic, challenges such as limited ICT infrastructure, inadequate training, and low awareness of available electronic resources continue to impede effective utilization. Aina and Olabode (2022) revealed that limited ICT skills and digital illiteracy often constrain effective utilization in developing countries and disparities in digital competence persisting among lecturers, often resulting in limited engagement with institutional digital resources. Obuh and Bozimo (2021) stated that usage levels among lecturers vary due to factors such as awareness, accessibility, ICT skills, and institutional support and ICT proficiency levels vary widely due to unequal access to training opportunities and infrastructural deficiencies. Furthermore, inadequate ICT proficiency remains a major barrier to the adoption of e-resources in Nigerian tertiary institutions (Adeleke & Olorunsola, 2022). However, despite efforts to digitalize higher education in Nigeria, poor internet connectivity, irregular power supply, and limited access to digital devices continue to impede the effective utilization of electronic resources (Ojedokun & Owolabi, 2016). In the context of Nigerian polytechnics, digital literacy and ICT proficiency has become increasingly crucial due to the growing adoption of e-learning systems and electronic databases. Therefore, this study bridged this gap by empirically investigating the extent to which digital literacy and ICT proficiency influence the utilization of electronic resources among lecturers in Kwara State Polytechnic, Ilorin. The outcome of this study provided insight into how digital competencies shape lecturers' access to, and effective use of electronic resources, and guided institutional policies on capacity building and ICT integration in teaching and research.

Empirical Review

Several empirical studies have examined the relationship between digital literacy, ICT competence, and electronic resource information utilization in tertiary institutions: Aina and Olabode (2022) investigated digital literacy and e-resource utilization among lecturers in colleges of education in South-west, Nigeria. Their findings revealed a significant relationship between digital literacy and the frequency of e-resource use. Lecturers with higher digital literacy demonstrated better access to online databases and journals. Similarly, Ogbemudia and Okoduwa (2023) conducted a study among academic staff in Nigerian polytechnics and found that ICT proficiency had a strong positive correlation with e-resource utilization. They concluded that ICT training significantly enhances lecturers' ability to navigate electronic databases and institutional repositories. In another study, Rahman and Ameen (2023) examined digital literacy and access to scholarly e-resources among lecturers in higher education institutions in Pakistan. Their results showed that digital literacy directly influences both the quality and frequency of electronic resource use. Similarly, Ehioghae and Okojie (2024) reported that lecturers' use of e-resources in Nigerian universities is positively associated with both ICT skills and access to stable internet facilities. Their regression analysis revealed that ICT proficiency explained 52% of the variance in e-resource utilization. A comparative study by Mushtaq and Shahzan (2025) across selected African universities found that digital literacy training and ICT support services significantly improved lecturers' engagement with digital repositories and research databases. On the other hand, Obuh and Bozimo (2021) reported that inadequate ICT facilities, poor internet access, and lack of awareness of available e-resources remain major obstacles to optimal utilization in Nigerian universities. These findings collectively underscore the importance of digital competence in maximizing e-resource use. However, there is a paucity of studies focusing specifically on polytechnic lecturers in Kwara State, despite the increasing emphasis on digital integration in technical and vocational education. This gap justifies the need for the present study, which explored how digital literacy and ICT proficiency influence the use of electronic resources among lecturers in Kwara State Polytechnic, Ilorin.

Methodology

The study adopted a descriptive survey design to collect quantitative data from a representative sample on the identified variables without manipulating them. A purposive sampling technique was employed to select just only Institute of Communication and Information Technology (IICT) from Kwara State Polytechnic. The sample size is all the 53 lecturers in the Institute. Questionnaire was employed as data collection instrument titled *"Digital Literacy, ICT Proficiency, and Electronic Resources Utilization Questionnaire (DLIPERUQ)"* and the validity was ensured through expert review to confirm content and face. Their feedback led to minor revisions for clarity and relevance. The reliability coefficient of the instrument was determined using Cronbach's Alpha, which yielded an overall coefficient of 0.87, indicating high internal consistency and reliability of the scale. Data were collected using a well-structured open-ended questionnaire. The instruments were administered to the respondents during the working hours of working days. Respondents were assured of the confidentiality of their responses and that the data collected would be used solely for academic purposes. The researchers followed up with reminders to ensure a satisfactory response rate. Data collected were analyzed using descriptive statistics such as frequency, percentage and mean scores with the aid of SPSS software. The results were presented in tables for easy interpretation and understanding. The researchers upheld ethical standards by ensuring voluntary participation, and confidentiality of respondents' information.

Data Analyses and Results

Response Rate

Table 1: Response Rate

Administered Questionnaire	Retrieved Questionnaire	Valid	Percentage (%)
53	44	41	77.3

A total of 53 questionnaires were administered to the respondents. Out of these, 44 questionnaires were retrieved, representing a retrieval rate of 83.0%. However, only 41 questionnaires were found usable for analysis after data cleaning and validation, resulting in a valid response rate of 77.3%. This valid response rate is considered adequate for social science research, as rates above 70% are generally regarded as acceptable for generating reliable and representative findings. The high retrieval and validity rates suggest good cooperation from the respondents and support the robustness of the subsequent data analysis.

Level of digital literacy among lecturers in Kwara State Polytechnic, Ilorin.

This section presents the analysis of data relating to the level of digital literacy possessed by lecturers of Kwara State Polytechnic. The purpose is to determine the extent to which lecturers possess the competencies required to effectively access, evaluate, manage, and utilize digital technologies and electronic information resources. Responses obtained from the respondents are summarized in Table 2.

Table 2: Level of digital literacy among lecturers in Kwara State Polytechnic

Digital Literacy	VH		H		L		VL		
	F	%	F	%	F	%	F	%	$\bar{X}$
My ability to search for academic information online is…	18	43.9	9	22.0	10	24.4	4	9.8	3.00
My ability to use search engines effectively (e.g., Google Scholar) is…	16	39.0	11	26.8	10	24.4	4	9.8	2.95
My skill in evaluating the credibility of online information sources is…	16	39.0	9	22.0	9	22.0	7	17.1	2.83
My competence in downloading, saving, and organizing digital documents is…	5	12.2	17	41.5	0	0.0	19	46.3	2.20
My skill in using academic databases and digital libraries is…	3	7.3	19	46.3	0	0.0	19	46.3	2.15
My ability to create digital content (e.g., slides, multimedia materials) is…	2	4.9	17	41.5	3	7.3	19	46.3	2.05

Decision Rule: *If $\bar{X}$ is 1.0 to 1.74 = Very Low (VL); 1.75 to 2.49 = Low (L); 2.50 to 3.24 = Higher (H); 3.25 to 4.0 = Very High (VH).*

The results in table 2 indicate that the respondents possess moderate digital literacy in basic online searching skills, such as searching for academic information and using search engines. However, advanced digital literacy skills, including the use of academic databases, digital document management, and digital content creation, were generally low, as reflected by lower mean scores. The results suggest that while lecturers are familiar with basic digital tasks, there are significant gaps in advanced digital competencies that may hinder effective utilization of electronic resources.

Level of ICT proficiency possessed by lecturers in Kwara State Polytechnic, Ilorin

This section presents the analysis of data on the level of Information and Communication Technology (ICT) proficiency possessed by lecturers in Kwara State Polytechnic, Ilorin. The purpose is to determine the extent to which lecturers possess the knowledge, skills, and competencies required to effectively use ICT tools and applications for teaching, research, communication, and access to electronic information resources. The findings provide an understanding of the lecturers' capability to utilize various ICT facilities in carrying out their academic responsibilities. The responses of the respondents are presented in Table 3.

Table 3: Level of ICT proficiency possessed by lecturers in Kwara State Polytechnic

ICT Proficiency	HP		MP		LP		NP		
	F	%	F	%	F	%	F	%	$\bar{X}$
I can operate a computer efficiently for academic tasks.	8	19.5	20	48.8	7	17.1	6	14.6	2.73
I am proficient in using Microsoft Office applications (Word, Excel, PowerPoint).	4	9.8	23	56.1	8	19.5	6	14.6	2.61
I can use institutional ICT facilities (e.g., digital library systems).	5	12.2	19	46.3	11	26.8	6	14.6	2.56
I am skilled in using internet-based communication tools (e.g., Email, Zoom).	16	39.0	5	12.2	15	36.6	5	12.2	2.51
I can manage electronic files and folders effectively.	6	14.6	14	34.1	15	36.6	6	14.6	2.49
I am able to use cloud storage platforms (e.g., Google Drive, OneDrive).	3	7.3	16	39.0	15	36.6	7	17.1	2.37

Decision Rule: *If $\bar{X}$ is 1.0 to 1.74 = Not Proficiency (NP); 1.75 to 2.49 = Less Proficiency (LP); 2.50 to 3.24 = Moderately Proficiency (MP); 3.25 to 4.0 = Highly Proficiency (HP).*

The results in table 3 show that the respondents demonstrate a moderate level of ICT proficiency, with mean scores ranging from 2.37 to 2.73. Higher proficiency was observed in basic computer operation and the use of Microsoft Office applications, while lower proficiency was evident in cloud storage usage and electronic file management. The findings suggest that although respondents possess foundational ICT skills, their competence in more advanced and emerging ICT tools remains limited.

Extent to which lecturers utilize electronic resources in Kwara State Polytechnic, Ilorin

This section presents the extent to which lecturers in Kwara State Polytechnic, Ilorin utilize electronic information resources for teaching, research, publication, professional development, and other academic activities. The analysis is intended to establish the frequency and level of use of various electronic resources available through the Polytechnic Library and other digital information platforms. The findings will indicate whether the available electronic resources are being effectively utilized by lecturers in support of their academic responsibilities. The responses are summarized in Table 4.

Table 4: Extent to which lecturers utilize electronic resources in Kwara State Polytechnic

Extent of Utilization	A		O		R		N		
	F	%	F	%	F	%	F	%	$\bar{X}$
I use e-journals for teaching and research.	19	46.3	9	22.0	10	24.4	3	7.3	3.07
I consult digital repositories for scholarly information.	17	41.5	8	19.5	14	34.1	2	4.9	2.98
I use e-books for course preparation and research.	17	41.5	8	19.5	14	34.1	2	4.9	2.98
I use electronic resources to update my lecture notes.	18	43.9	7	17.1	12	29.3	4	9.8	2.95
I access online databases provided by the Polytechnic.	3	7.3	11	26.8	23	56.1	4	9.8	2.32
I download and store digital materials for academic use.	2	4.9	12	29.3	23	56.1	4	9.8	2.29

Decision Rule: *If $\bar{X}$ is 1.0 to 1.74 = Never (N); 1.75 to 2.49 = Rarely (R); 2.50 to 3.24 = Often (O); 3.25 to 4.0 = Always (A).*

The results in table 4 indicate a moderate extent of utilization of electronic resources among the respondents. Higher usage was recorded for e-journals, e-books, digital repositories, and the use of e-resources for updating lecture notes. However, low utilization was observed in accessing institutional online databases and in downloading and storing digital materials. The results suggest that while the respondents make use of readily accessible electronic resources, the utilization of subscription-based and institution-provided digital resources remains limited.

Challenges affecting the utilization of electronic resources by lecturers in Kwara State Polytechnic, Ilorin

This section presents the analysis of the challenges affecting the utilization of electronic resources by lecturers in Kwara State Polytechnic, Ilorin. The objective is to identify the major factors that hinder lecturers from effectively accessing and utilizing electronic information resources for teaching, research, and other scholarly activities. Understanding these constraints will provide insights into areas requiring institutional intervention to improve the accessibility and effective use of electronic resources. The responses obtained from the respondents are presented in Table 5.

Table 5: Challenges affecting the utilization of electronic resources by lecturers in Kwara State Polytechnic

Challenges	SA		A		D		SD		
	F	%	F	%	F	%	F	%	M
Lack of awareness of available electronic resources affects my usage.	8	19.5	20	48.8	7	17.1	6	14.6	2.73
Limited access to subscription databases is a major challenge.	7	17.1	21	51.2	8	19.5	5	12.2	2.73
The user interface of some e-resources is difficult to navigate.	5	12.2	22	53.7	7	17.1	7	17.1	2.61
I experience difficulty in retrieving relevant information from databases.	5	12.2	18	43.9	10	24.4	8	19.5	2.49
Inadequate ICT facilities hinder my use of e-resources.	6	14.6	7	17.1	15	36.6	13	31.7	2.15
I lack adequate training on how to use electronic resources effectively.	5	12.2	7	17.1	14	34.1	15	36.6	2.05

Decision Rule: *If $\bar{X}$ is 1.0 to 1.74 = Strongly Disagree (SD); 1.75 to 2.49 = Disagree (D); 2.50 to 3.24 = Agree (A); 3.25 to 4.0 = Strongly Agree (SA).*

The results in table 5 indicate that lack of awareness of available electronic resources and limited access to subscription databases are the most prominent challenges affecting respondents' utilization of electronic resources, as reflected by the highest mean scores (M = 2.73). Difficulties related to navigating e-resource interfaces and retrieving relevant information were also reported at a moderate level. In contrast, inadequate ICT facilities and lack of adequate training recorded lower mean scores, suggesting that although they pose challenges, they are perceived as less severe by the respondents. The findings show that awareness and access-related issues constitute the major barriers to effective electronic resource utilization among the respondents.

Discussion of Findings

The findings of this study reveal important insights into the digital literacy skills, ICT proficiency, extent of electronic resource utilization, and challenges affecting lecturers in Kwara State Polytechnic, Ilorin in utilization of electronic resources. The results indicate that lecturers possess a moderate level of digital literacy, particularly in basic skills such

as searching for academic information online and using search engines like Google Scholar. This suggests that most lecturers are familiar with general online information retrieval practices. This finding is consistent with the studies of Aina and Akpojotor (2019) and Ilori, Okoro and Abayomi (2022), they reported that academic staff in Nigerian tertiary institutions generally demonstrate adequate competence in basic digital and online searching skills. However, the study also revealed low proficiency in advanced digital literacy skills, including the use of academic databases, digital document management, and digital content creation. Ukwoma and Echezona (2017) found that lecturers were more comfortable with the use of general search engines and open-access platforms than with specialized academic databases. The implication is that limited advanced digital skills may restrict lecturers' ability to maximize the scholarly benefits of electronic resources.

In terms of ICT proficiency, the findings show that lecturers demonstrate a moderate level of competence in basic ICT operations such as computer usage and Microsoft Office applications. However, lower mean scores were recorded for cloud storage usage and electronic file management, indicating gaps in emerging ICT skills. This is in line with the findings of Agyekum and Brempong (2020) and Olayemi and Ojo (2023), who reported that lecturers in Nigerian tertiary institutions are generally proficient in traditional ICT applications but exhibit limited competence in advanced and cloud-based technologies. Similarly, Umar, Shuaibu, and Aliyu (2024) observed that while academic staff possess foundational ICT skills, deficiencies in emerging digital tools continue to constrain effective engagement with electronic information resources. Such gaps may affect lecturers' efficiency in managing digital academic materials and collaborating effectively in digital environments.

The study further reveals a moderate extent of electronic resource utilization among lecturers. While respondents reported relatively high usage of e-journals, e-books, and digital repositories, utilization of institution-provided online databases and systematic downloading and storage of digital materials was low. This aligns with the findings of Okiki and Asiru (2011) and Ukwoma and Echezona (2017), who observed that academic staff in Nigerian tertiary institutions tend to rely more on freely accessible electronic resources than on subscription-based databases provided by their institutions. Similarly, Tella, Orim, Ibrahim and Memudu (2018) reported that limited awareness, inadequate search skills, and interface complexity often discourage lecturers from fully utilizing licensed electronic databases, despite their availability. This pattern suggests a preference for easily accessible and familiar resources over subscription-based databases that often require specialized search skills.

Regarding challenges, the study identified lack of awareness of available electronic resources and limited access to subscription databases as the most significant barriers to effective utilization. Difficulties in navigating e-resource interfaces and retrieving relevant information were also reported at a moderate level. Interestingly, inadequate ICT facilities and lack of training were perceived as less severe challenges, suggesting that infrastructure may exist but is not being optimally leveraged. These findings are consistent with the findings Ani (2013) and Tella, Orim, Ibrahim and Memudu (2018), they reported that awareness and access-related issues, rather than mere availability of ICT infrastructure, are the primary constraints to effective use of electronic information resources in Nigerian tertiary institutions. Similarly, Owate (2024) highlighted that limited knowledge of available e-resources and subscription databases remains a key barrier to lecturers' optimal engagement with digital scholarly tools.

Conclusion

This study revealed that lecturers possess a moderate level of digital literacy and ICT proficiency, particularly in basic online searching and routine computer operations. Also, the study also identified significant deficiencies in advanced digital skills, including the use of academic databases, digital content creation, cloud storage, and effective digital document management. The extent of electronic resource utilization among lecturers was found to be moderate, with greater reliance on easily accessible resources such as e-journals, e-books, and digital repositories, while institution-provided subscription databases were relatively underutilized. This pattern suggests that familiarity, awareness, and skill level play critical roles in shaping usage behaviour. Furthermore, the study identified lack of awareness of available electronic resources and limited access to subscription databases as the major challenges hindering optimal utilization, alongside difficulties in navigating resource interfaces. However, the study concludes that while the Polytechnic has made efforts to provide electronic resources, lecturers' digital literacy and ICT proficiency significantly influence the extent to which these resources are effectively utilized. Without targeted interventions to strengthen advanced digital competencies and improve awareness and access, the potential benefits of electronic resources for teaching, research, and professional development may not be fully realized.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are proposed:

1. The Polytechnic management should organize continuous training workshops and seminars aimed at improving lecturers' advanced digital literacy and ICT skills, particularly in academic database searching, digital content creation, cloud computing, and electronic resource management.
2. The Polytechnic library should intensify awareness programmes through orientations, email alerts, and departmental briefings to inform lecturers about available electronic resources and how to access them.

3. Efforts should be made to expand and sustain access to relevant subscription-based databases, while ensuring that access procedures are simplified to encourage greater usage among lecturers.
4. Dedicated ICT and library support units should be strengthened to provide on-demand assistance, user guides, and step-by-step tutorials to help lecturers navigate electronic resources more effectively.
5. Digital literacy and ICT proficiency should be formally integrated into staff development and appraisal policies to encourage continuous skill acquisition and professional growth.

Abstract

This study investigated the influence of digital literacy and research skills on the utilisation of library resources among postgraduate students of the National Open University of Nigeria (NOUN). The study was motivated by concerns over the underutilisation of library resources despite their importance in supporting academic research, learning, and knowledge development. Two research questions guided the study: the types of library resources utilised by postgraduate students and the influence of digital literacy and research skills on library resource utilisation. A descriptive survey research design was adopted. The population comprised 7,460 postgraduate students enrolled in NOUN during the 2023/2024 academic session. Using the Krejcie and Morgan sample size determination table, a sample of 361 respondents was selected through stratified random sampling. Data were collected using a self-structured questionnaire validated by experts in Library and Information Science and Educational Measurement and Evaluation. The instrument yielded a Cronbach's Alpha reliability coefficient of 0.845. Data were analysed using descriptive statistics, including frequencies, percentages, means, and standard deviations. The findings revealed that textbooks (87.3%), journals (79.7%), online databases (73.7%), e-books (72.0%), and e-journals (53.4%) were the most frequently utilised library resources. In contrast, specialised resources such as bibliographies, encyclopaedias, reports, maps, atlases, and online catalogues were less frequently used. The study further established that digital literacy and research skills significantly influenced library resource utilisation, as respondents demonstrated competence in searching databases, evaluating information sources, accessing online resources, and using citation management tools. The study concluded that strengthening digital literacy and research competencies is essential for enhancing effective library resource utilisation. It recommended continuous information literacy training, improved digital infrastructure, and increased awareness of underutilised library resources to support postgraduate learning and research productivity.

Keywords: Digital Literacy, Research Skills, Library Resource, Postgraduates, National Open University of Nigeria.

Introduction

Digital literacy and research skills are essential competencies in today's information-driven society, especially within the context of modern libraries. Digital literacy refers to the ability to effectively locate, assess, utilise, and communicate information through digital technologies and online resources. In contrast, research skills encompass techniques for finding, analysing, and synthesising information to support academic, professional, or personal goals. According to Dongkai et al. (2025), as libraries transition from traditional collections to digital platforms, users equipped with strong digital literacy and research skills can more efficiently navigate electronic catalogues, databases, and online journals. These individuals are better able to identify credible sources, employ advanced search techniques, and utilise digital tools for research, thereby maximising the benefits of library services. Such skills not only enable users to critically evaluate digital sources reducing misinformation and building reliable foundations but also foster lifelong learning, independence, and confidence in managing complex information challenges.

Libraries whether at primary, secondary, or tertiary levels are vital educational resources that serve the diverse needs of communities. The term "library" derives from the Greek word "liber," meaning "book," and refers to a carefully curated collection of materials organised for reading, studying, consultation, and research. In higher education, academic libraries act as centres of learning, supporting students and faculty by providing access to scholarly literature that is often not freely available online. The effective use of library resources depends not only on access but also on the skills to actively engage with a variety of information sources. Librarians play an essential role in collecting, organising, and preserving recorded knowledge, ensuring users can easily access materials to support their academic activities. The 'Use and Gratification' theory highlights the psychological motivations behind engaging with library resources, emphasising

the importance of understanding why and how individuals utilise these sources to meet their informational needs (Mensonides et al., 2024).

Fostering digital literacy and research skills is essential for maximizing the effective use of library resources. These skills not only support academic success and professional development but also empower individuals to participate actively and responsibly in the digital society. As libraries continue to evolve in response to rapid technological advancements, the integration of digital literacy into library services ensures that users can fully avail themselves of available resources. This integration allows for the enhancement of learning and research capabilities, enabling users to contribute meaningfully to the generation of new knowledge (Ji. et al., 2024).

Cultivating digital literacy promotes informed and ethical engagement with digital resources. It empowers individuals to critically evaluate information, make informed decisions, and participate in the digital economy. Furthermore, digital literacy supports the responsible use of technology, reducing the risk of cyberbullying, online harassment, and other forms of digital exploitation. Libraries that prioritise digital literacy and research skills are well-positioned to meet the evolving needs of their communities. By providing access to digital resources, training in digital literacy, and support for research and learning, libraries can foster a culture of lifelong learning and digital engagement. As technology continues to advance, libraries will remain essential hubs for education, innovation, and community development.

Statement of the Problem

Libraries constitute the heart and soul of any academic institution, playing a vital role in shaping knowledge, fostering research, and supporting learning within a diverse community. They house a wealth of information resources, meticulously organised by dedicated professionals known as librarians. In universities, academic libraries serve as centres of activity for both students and staff, offering a range of services aimed at maximising the utilisation of library resources, which are essential for various academic pursuits such as research, teaching, learning, community engagement, and lifelong education. The quality of education at a university is often reflected in how frequently students utilise both print and digital library resources, thereby enhancing their knowledge and learning experience. These resources are designed to assist users in broadening their understanding through reading, completing assignments, and conducting research on a wide range of topics.

Currently, the University Library faces a significant challenge in adapting to the demands of the 21st century, particularly considering increasing demographic changes that have resulted in the underutilisation of its resources (Suliman, et al., 2024). Despite the numerous benefits offered by the library, postgraduate students at the National Open University appear to neglect these resources when aiming to improve their academic success. The researcher has observed that these students rarely visit the library, with weekly statistics reflecting this trend. A possible explanation for this low level of engagement may be a lack of information literacy skills, which encompass defining research tasks, developing effective information-seeking strategies, locating and accessing relevant information, as well as synthesising and evaluating resources. This underscores the urgent need to explore how enhancing information literacy skills among postgraduate students could improve their utilisation of library resources. Consequently, this research aims to investigate postgraduates' digital competence and research abilities affecting library resource application at the National Open University of Nigeria.

Research Questions

1. What are the types of library resources used by postgraduate students in the National Open University of Nigeria?
2. How does the level of postgraduates' digital competence and research abilities influence their utilisation of library resources at the National Open University of Nigeria?

Review of Literature

Types of Library Resources Used by Postgraduate Students

Library resources constitute the information materials and services made available to users to support teaching, learning, and research activities. Modern academic libraries provide both print and electronic resources, including textbooks, reference materials, journals, theses and dissertations, databases, institutional repositories, audiovisual materials, and internet-based resources. According to Suleiman, et al (2024), academic libraries have expanded beyond traditional collections to include digital resources that can be accessed remotely through library portals and electronic databases.

Postgraduate students depend heavily on various library resources because of the advanced nature of their academic and research work. Studies indicate that scholarly journals, electronic databases, theses, dissertations, and reference materials are among the most frequently used resources by postgraduate students. Dongkai, et al (2025) observed that electronic journals and online databases have become the preferred sources of information among postgraduate students due to their accessibility and currency of information. Similarly, Sunny and Ramasamy (2025) found that postgraduate students in Nigerian universities frequently utilize electronic databases such as EBSCOhost, JSTOR, ScienceDirect, and institutional repositories to obtain scholarly information for research projects and dissertations. The study further revealed that while printed books remain relevant, electronic resources are increasingly becoming the dominant source of academic information.

The emergence of digital libraries has significantly transformed information access patterns among postgraduate students. According to Dongkai et al. (2025), digital platforms enable users to access information resources irrespective of geographical location, thereby improving convenience and flexibility. This is particularly relevant for distance-learning institutions such as the National Open University of Nigeria (NOUN), where students rely heavily on online access to information resources.

Despite the availability of diverse library resources, several studies report varying levels of utilization. Suleiman et al. (2024) noted that many postgraduate students underutilize available library resources due to inadequate awareness, poor information-searching skills, and limited digital competence. This suggests that availability alone does not guarantee effective utilization of library resources.

Therefore, understanding the specific types of library resources used by postgraduate students is necessary for evaluating resource effectiveness and identifying areas requiring improvement in library service delivery.

Influence of Digital Competence and Research Abilities on Utilisation of Library Resources

Digital competence refers to the knowledge, skills, attitudes, and abilities required to effectively use digital technologies for information retrieval, communication, learning, and problem-solving. Research abilities encompass competencies associated with identifying information needs, locating relevant sources, evaluating information, analyzing data, and synthesizing findings for academic purposes.

The rapid digitization of academic information resources has increased the importance of digital competence among library users. According to Ji et al. (2024), digital competence enables students to navigate electronic databases, online catalogues, institutional repositories, and digital libraries efficiently. Students possessing higher levels of digital competence are more likely to utilize library resources effectively than those with limited technological skills. Research abilities also play a significant role in determining library resource utilization. The information literacy framework proposed by Association of College and Research Libraries emphasizes that users must be able to recognize information needs, develop search strategies, evaluate information sources, and ethically use information. These competencies directly influence the effectiveness with which students engage with library resources.

Several empirical studies have established a positive relationship between digital competence and library use. Mensonides et al. (2024), drawing on the Uses and Gratifications Theory, argued that users are more likely to engage with library resources when they possess the necessary skills to satisfy their information needs. The study found that digital literacy significantly predicts the frequency and effectiveness of library resource utilization among university students. Similarly, Suleiman et al. (2024) reported that postgraduate students with stronger digital skills demonstrated higher levels of electronic resource usage than students with limited digital competencies. The study attributed this difference to the ability of digitally competent students to conduct advanced searches, evaluate information quality, and access resources through multiple digital platforms. Research conducted by Dongkai et al. (2025) further revealed that students who possess advanced research skills are better positioned to identify credible information sources, formulate effective search strategies, and synthesize information from diverse resources. Such competencies contribute significantly to increased utilization of library resources and improved research outcomes.

In the context of open and distance learning institutions, digital competence and research abilities become even more critical because students rely primarily on online information resources rather than physical library collections. Therefore, improving these competencies among postgraduate students may enhance their access to and utilization of library resources, ultimately contributing to academic success and research productivity.

Empirical Gap

Although several studies have examined digital literacy, information literacy, and library resource utilization among university students, significant gaps remain in the existing literature. Most previous studies have focused on conventional universities where students have regular physical access to library facilities. Limited empirical attention has been given to open and distance learning institutions such as the National Open University of Nigeria, where learning and information access are predominantly technology-driven.

Furthermore, many studies have investigated digital literacy and library use independently without examining the combined influence of digital competence and research abilities on library resource utilization among postgraduate students. Existing studies have also concentrated largely on undergraduate populations, leaving postgraduate students relatively underrepresented despite their greater research demands.

In addition, while previous research has documented the availability and utilization of electronic resources, there is insufficient evidence regarding the specific types of library resources most frequently used by postgraduate students in NOUN and how variations in digital competence and research abilities influence such utilization. Consequently, this study seeks to fill this gap by investigating the types of library resources used by postgraduate students and examining the extent to which their digital competence and research abilities influence the utilization of library resources at the National Open University of Nigeria.

Methodology

Research Design

This study adopted a descriptive survey research design. The choice of this design was informed by the nature and objectives of the study, which sought to examine the influence of digital literacy and research skills on the utilisation of library resources among postgraduate students of the National Open University of Nigeria (NOUN). Descriptive survey design is appropriate because it enables the researcher to obtain data directly from a large population and describe existing conditions, behaviours, perceptions, and relationships without manipulating any variables. The design facilitates the collection of quantitative data from respondents across diverse locations, making it particularly suitable for NOUN's distance learning environment where students are geographically dispersed. Furthermore, it allows for the generation of findings that can be generalised to the wider postgraduate student population.

Population of the Study

The population of this study comprised all postgraduate students enrolled in the National Open University of Nigeria (NOUN) during the 2025/2026 academic session. According to institutional records, the postgraduate student population stood at 7,460 students. This population included students enrolled in postgraduate diploma, master's, and doctoral programmes across the various faculties and study centres of the university. The focus on postgraduate students was based on the assumption that they engage extensively in scholarly activities and therefore constitute an appropriate population for investigating the influence of digital literacy and research skills on library resource utilisation.

Sample Size

The sample size for the study was determined using the Krejcie and Morgan (1970) sample size determination table. Based on a target population of 7,460 postgraduate students, a minimum sample size of 361 respondents was considered adequate to achieve a 95% confidence level and a 5% margin of error. The selected sample size was therefore deemed representative of the study population and sufficient for statistical analysis and generalisation of findings.

Sampling Technique

The study employed a stratified random sampling technique to ensure adequate representation of the different categories of postgraduate students within the university. The population was first stratified according to the major postgraduate programme categories, namely Postgraduate Diploma (PGD), Master's, and Doctoral (PhD) programmes. Thereafter, the sample size of 361 respondents was proportionally allocated to each stratum based on the relative size of each subgroup within the total population. Within each stratum, respondents were selected through simple random sampling. This procedure enhanced the representativeness of the sample and minimised sampling bias by ensuring that all categories of postgraduate students had an equal opportunity to participate in the study.

Procedure for Data Collection

Data for the study were collected using a self-structured questionnaire developed by the researcher based on the objectives of the study and relevant literature. The questionnaire consisted of sections covering respondents' demographic characteristics, digital literacy competencies, research skills, and the extent of library resource utilisation. Prior to the main study, the instrument was subjected to expert review to establish its face and content validity. After obtaining the necessary institutional approvals, the questionnaire was administered to the selected respondents through appropriate channels accessible to postgraduate students of NOUN. Participants were informed of the purpose of the study, and their voluntary participation and confidentiality were assured.

Validity and Reliability of the Instrument

To ensure the validity of the instrument, the questionnaire was reviewed by experts in Library and Information Science and educational measurement and evaluation. Their observations and recommendations guided the revision of the instrument to ensure that the items adequately measured the constructs under investigation.

The reliability of the instrument was established through a pilot study conducted among postgraduate students who were not part of the main study population. The responses obtained were analysed using Cronbach's Alpha reliability coefficient, which yielded an overall reliability index of 0.845. This coefficient exceeded the acceptable threshold of 0.70, indicating that the instrument possessed satisfactory internal consistency and was reliable for data collection.

Method of Data Analysis

Data collected from the respondents were coded and analysed using the Statistical Package for the Social Sciences (SPSS) version 25. Descriptive statistics, including frequencies, percentages, means, and standard deviations, were employed to summarise respondents' characteristics and describe the study variables. The choice of these statistical tools was based on their suitability for describing patterns and trends in survey data and addressing the research objectives of the study.

Table 1: Research Objective One: Types of library resources used by postgraduate students in the National Open University of Nigeria

Library Resources	Freq.	Percentage %
Textbooks	65	87.3
Journals	48	79.7
Online databases	41	73.7
e-book	48	72.0
e-journals	37	53.4
Dictionaries	30	38.1
Magazines	23	48.3
Bibliographies	19	27.1
Encyclopedias	16	26.3
Reports	12	20.3
Online Catalogue	16	24.6
Maps	4	5.9
Atlases	3	4.1

The table indicates that postgraduate students at the National Open University of Nigeria predominantly utilise core academic resources such as textbooks, journals, and online databases. Textbooks are the most frequently used resource, with an impressive 87.3% of students relying on them, emphasising their importance as primary learning materials. Journals also feature prominently, with nearly 80% of students engaging with them, highlighting the significance of current research and scholarly articles in their academic pursuits. Furthermore, a substantial proportion of students utilise online databases (73.7%) and e-books (72.0%), reflecting a strong preference for digital and readily accessible resources that support their research activities.

Beyond these core resources, students also make moderate use of e-journals, dictionaries, and magazines. Over half of the students (53.4%) access e-journals, indicating a reliance on electronic scholarly materials, although marginally less than traditional journals. Dictionaries are employed by approximately 38% of students, suggesting they serve as important reference tools for language, terminology, or clarification purposes. Magazines, which may cater to current affairs or more general interests, are utilised by nearly half of the students (48.3%), indicating some engagement with less formal or more contemporary content.

Conversely, the utilisation of less common resources such as bibliographies, encyclopaedias, reports, online catalogues, maps, and atlases is comparatively low. Bibliographies and encyclopaedias are used by about a quarter of the students, which suggests their relevance might be limited to specific research contexts. Similarly, maps and atlases are amongst the least used resources, with fewer than 6% of students relying on them, indicating their limited role in postgraduate research at this university. The data demonstrates that postgraduate students predominantly engage with scholarly, digital, and print materials directly related to academic research, while resources such as maps and atlases are only marginally relevant within this academic environment.

Table 2: Level of postgraduates' digital competence and research abilities influence their utilisation of library resources at the National Open University of Nigeria

S/N	Items	SA	A	D	SD	$\bar{X}$	Std.	Remark
	N (361)	4	3	2	1			
1.	My digital skills enable me to effectively search online databases and journals.	172(51.5)	120(35.9)	25(7.5)	17(5.1)	3.34	0.825	SA
2.	I am confident in my ability to critically evaluate online sources for academic purposes.	187(56.0)	114(34.1)	24(7.2)	9(2.7)	3.43	0.743	SA
3.	My research skills enable me to efficiently use library resources to achieve my academic goals.	166(49.7)	116(34.7)	25(7.5)	27(8.1)	3.26	0.911	SA

4.	I am familiar with the library's online resources and can access them easily.	164(49.1)	119(35.6)	22(6.6)	29(8.7)	3.25	0.918	SA
5.	My digital literacy skills help me to effectively use citation management tools.	165 (45.7%)	120 (33.2 %)	25 (6.9%)	10 (2.8%)	3.5	0.8	
6.	I believe that my research skills are sufficient to utilise library resources effectively.	170 (50%)	115 (28.2%)	25 (6.9%)	!0 (2.8%)	3.5	0.8	

The data indicates that postgraduate students at the National Open University of Nigeria generally perceive their digital skills as a crucial factor in effectively utilising library resources. A significant majority, 87.4%, agree that their digital competence enables them to efficiently search online databases and journals, with a mean score of 3.34. This reflects a high level of confidence in navigating digital tools for academic research. Similarly, 90.1% of respondents feel confident in their ability to critically evaluate online sources, supported by a mean of 3.43, highlighting strong digital literacy in assessing the quality and relevance of information.

Furthermore, the students' research skills are perceived to play an important role in their academic activities. About 84.4% agree that their research abilities help them to utilise library resources more effectively, with a mean score of 3.26. This suggests that research proficiency significantly enhances their capacity to access and use academic materials. In addition, nearly 85.2% of students are comfortable accessing online library resources, with a mean score of 3.25, indicating a good level of familiarity and ease in navigating digital library platforms.

The table also shows that digital literacy extends to managing references, with 79.1% of respondents agreeing that their skills assist them in using citation management tools effectively, supported by a mean of 3.5. Lastly, half of the students believe that their research skills are sufficient for effective resource utilisation, which is also reflected in a mean score of 3.5. The data suggests that students perceive their digital competence and research abilities as vital enablers for making effective use of library resources, which likely contributes positively to their academic success.

Discussion of Findings

The findings relating to the types of library resources utilised by postgraduate students in the National Open University of Nigeria revealed that textbooks, journals, online databases, and e-books constitute the most frequently used information resources. The predominance of textbooks (87.3%) suggests that postgraduate students continue to depend heavily on foundational and prescribed learning materials to support coursework and independent study. The high utilisation of journals (79.7%) further indicates that students recognise the importance of current scholarly literature in advancing their academic and research activities. Similarly, the substantial use of online databases (73.7%), e-books (72.0%), and e-journals (53.4%) reflects the increasing acceptance of digital resources among postgraduate students within the open and distance learning environment.

The extensive use of electronic information resources may be attributed to the flexible learning structure of NOUN, which requires students to access information remotely and independently. The findings imply that postgraduate students are adapting to the digital information landscape by integrating both print and electronic resources into their learning processes. However, the relatively low utilisation of resources such as bibliographies, encyclopaedias, reports, online catalogues, maps, and atlases suggests that these materials are either less relevant to the academic demands of the respondents or that students may lack adequate awareness and skills required to exploit these specialised resources effectively.

These findings corroborate previous studies which reported that postgraduate students tend to prioritise scholarly and electronically accessible resources that directly support research and academic tasks. Studies on information-seeking behaviour among postgraduate students have consistently shown a preference for journals, textbooks, and online databases because of their perceived usefulness, accessibility, and relevance to postgraduate research. The findings therefore suggest that university libraries should continue to strengthen access to both print and electronic scholarly resources while promoting awareness of underutilised information sources that may enrich research outcomes.

Furthermore, the findings revealed that postgraduate students perceive their digital competence and research abilities as important determinants of effective library resource utilisation. Most respondents agreed that their digital skills enable them to search online databases and journals efficiently (87.4%) and critically evaluate online information sources for academic purposes (90.1%). This demonstrates that digital literacy competencies, particularly information searching and evaluation skills, play a significant role in enabling students to navigate the increasingly digital academic information environment.

The findings also showed that respondents believed their research skills enhanced their ability to utilise library resources effectively (84.4%), while a large proportion indicated familiarity with accessing online library resources (85.2%). This

suggests that students who possess stronger research competencies are more capable of identifying relevant information needs, selecting appropriate resources, and using available library services to achieve their academic objectives. The ability to use citation management tools effectively and confidence in one's research abilities further reinforce the notion that digital literacy and research competence complement each other in facilitating successful information use.

The findings align with the propositions of the Information Literacy framework and previous empirical studies which emphasise that the ability to locate, evaluate, organise, and ethically use information significantly influences academic information behaviour. They are also consistent with studies that identified digital literacy as a predictor of effective utilisation of electronic information resources among postgraduate students. Students who possess adequate digital and research competencies are more likely to maximise the benefits of available library resources, thereby enhancing the quality of their academic work and research productivity.

The findings demonstrate that while postgraduate students at the National Open University of Nigeria actively utilise core scholarly resources and exhibit positive perceptions of their digital and research competencies, there remains a need for continuous user education programmes. Such initiatives should focus on strengthening advanced information literacy skills and promoting the use of specialised library resources that are currently underutilised. Enhancing these competencies would not only improve library resource utilisation but also contribute to the development of independent, information-literate researchers capable of thriving in contemporary knowledge environments.

Summary of Findings

According to Sunny (2025), postgraduate students predominantly relied on core academic resources such as textbooks, journals, and online databases, reflecting a preference for materials that support rigorous academic research. Yu (2025) highlighted that digital competence and research skills significantly influenced students' ability to effectively utilise library resources, with most students expressing high confidence in their digital literacy and critical evaluation abilities. Xia (2025) further noted that digital skills and research proficiency were perceived as vital enablers of academic success, suggesting that enhancing these competencies could lead to better resource utilisation and research outcomes among postgraduate learners. Additionally, Wu et al. (2025) emphasised that students' engagement with digital resources was closely linked to their overall academic performance, while Marmoah (2025) underscored the importance of institutional support in developing students' digital literacy and research skills to optimise resource use.

Conclusion

This study concluded that postgraduate students at the National Open University of Nigeria primarily utilise scholarly resources such as textbooks, journals, online databases, e-books, and e-journals to support their academic and research activities. The preference for these resources reflects their relevance and accessibility within the open and distance learning environment. In contrast, specialised resources, including bibliographies, encyclopaedias, reports, online catalogues, maps, and atlases, remain underutilised, possibly due to limited awareness, inadequate skills, or perceived irrelevance. The study further established that digital literacy and research skills significantly influence effective library resource utilisation. Students demonstrated confidence in searching databases, evaluating online information, accessing electronic resources, and using citation management tools, while also acknowledging the importance of research competencies in information retrieval and use. The findings suggest that effective utilisation of library resources depends not only on resource availability but also on strengthening users' digital and research competencies to enhance academic performance and research productivity.

Recommendations

1. The National Open University of Nigeria Library should maintain and enhance access to key scholarly resources such as textbooks, journals, databases, e-books, and e-journals while promoting greater use of underutilized resources through library orientation programmes, digital guides, and awareness campaigns. This will improve students' access to information and increase overall library resource utilisation.
2. The National Open University of Nigeria should strengthen postgraduate students' information literacy and research skills through continuous training, integration into orientation and research courses, proactive librarian support, and improved digital infrastructure to enhance access to and effective use of electronic resources.

Abstract

The advent of digital platforms has significantly influenced how academic libraries communicate with users and promote information services. Social media platforms have become veritable tools for enhancing information access, engaging users, and delivering services beyond physical spaces. This study investigated how academic libraries in Imo State, Nigeria, are utilizing social media platforms to strengthen digital platforms connections and support effective information service delivery. Five research objectives were formulated to guide the study. The population of the study comprised all the professional librarians in five academic libraries in Imo State. The study adopted a descriptive survey research design. The data were analyzed using descriptive statistical tools such as frequency counts, simple percentage and tables. The results were presented in tables, frequency and percentage for easy interpretation. The Findings revealed that social media platforms such as Facebook, WhatsApp, Twitter, (X) and YouTube are the most used social media platforms. The findings also revealed that current awareness services, dissemination of information, promoting electronic resources, and facilitating virtual reference interactions are some of the services rendered with social media. The findings identified some benefits such as improved communication, increased visibility of library services and enhanced user engagement. Despite these benefits, challenges such as poor internet connectivity, irregular power supply, inadequate funding, lack of trained ICT staff and lack of institutional policy still persist. The study recommended among others: the development of formal social media policies, continuous staff training programmes, and also alternative source of power supply to enhance effective use of digital platforms in academic libraries in Imo State. The study concluded that even though social media platforms have significantly transformed library service delivery; strategic interventions are still required to maximize its potential.

Keywords: Digital platforms, social media, academic libraries, Imo State, library services, user engagement

Introduction

In the early years of the twenty first century, most libraries underwent a significant shift as emerging technologies transformed the way information was been created, accessed and disseminated. The emergence of Internet and advancements in technology has brought about great transformation in the library. Kaplan & Haenlein, (2010) rightly pointed out that the emergence of Web 2.0 applications has redefined how information is created, disseminated, and accessed, necessitating a shift from traditional service models to more interactive and user-centered approaches. In order for libraries to remain relevant they embrace social media platforms such as Facebook, Twitter, and Instagram to interact with their communities, publicize services and events, and reach users beyond their physical locations. These platforms enhanced communication, facilitated resource sharing, and supported the development of active online communities, thereby redefining the role of libraries in the digital era. Through innovative posts, inclusive outreach initiatives, and real-time engagement, libraries utilize social media to promote reading culture, encourage lifelong learning, and strengthen community connections in an increasingly digital environment.

Nwachi and Igbokwe (2019) defined social media as web-based platforms that enable users to create public or semi-public profiles within a bounded system, connect with other users, and view and navigate their own as well as others' networks. Most academic libraries are now undergoing significant transformation driven by advancements in digital technologies. Social media platforms, as core components of Web 2.0, have become indispensable tools for libraries seeking to enhance their visibility, improve service delivery, and foster user engagement. Some academic libraries in Imo State are already adopting social media platforms such as Facebook, WhatsApp, Twitter, Instagram etc. to communicate with their users, promote services, and provide access to information resources beyond their physical boundaries. These platforms support real-time interaction, collaborative knowledge sharing, and user participation, thereby aligning library services with the expectations of digitally oriented users (Aharony, 2012).

The integration of social media into library operations reflects a broader paradigm shift toward participatory librarianship, where users are not merely passive recipients of information but active contributors to knowledge creation. Consequently, libraries are repositioning themselves as dynamic, technology-driven institutions capable of responding to the evolving needs of their communities. Despite the growing adoption of social media in academic libraries, its utilization in Imo State remains limited. Most academic libraries lack the necessary ICT facilities, skilled personnel, and strategic policy frameworks required for effective implementation. It is based on this premise that this study is conducted to investigate how libraries in Imo state are utilizing social media platforms for service delivery.

Statement of the problem

The use of social media platforms and their transformational changes in information dissemination and service delivery cannot be overlooked. Social media has become a cornerstone for modern libraries, enabling them to enhance their services and build meaningful connections with their communities. From promoting events and sharing resources to fostering engagement and gathering feedback, these platforms allow libraries to stay relevant and impactful in a digital-first world. Despite the growing importance of social media in information dissemination, many academic libraries in Imo State have not fully optimized these platforms for effective service delivery. Challenges such as inadequate digital skills, poor infrastructure, and inconsistent usage limit their potential. Given this scenario, this research therefore investigated how social media platforms are being utilized in academic libraries in Imo State.

Objectives of the Study:

Specifically, this study intends to:

i. Identify the type social media platforms used in academic libraries in Imo State.
ii. Determine the services librarians used social media tools for in academic libraries in Imo.
iii. Find out the purposes of using social media platforms for library service delivery.
iv. Identify the benefits librarians derive in using of social media platforms for library service delivery.
v. Identify challenges librarians encounter in using social media platforms for library service delivery

Literature Review

Social media is often referred to as a collection of web-based programmes that support the production and dissemination of user-generated content and expand on the conceptual and technical. Bradley (2012) defined the term social media as the use of web-based and mobile technologies to turn communication into interactive dialogue underpinnings of web 2.0. It is user-centric, multifunctional, and not location- or time-constrained. The University of South Florida (2025) stated that social media encompasses online platforms and applications that enable users to create, share, and interact with each other through various forms of contents, like text, images, and videos. It facilitates the creation of online communities and networks, allowing users to stay connected, share information, and participate in conversations. According to Chuma-Ibe (2019), a social media networking site is an online portal or web service built for social relations among groups of individuals. In the context of libraries, these platforms facilitate communication, collaboration, and information dissemination. Facebook, WhatsApp, Twitter, YouTube, Instagram, blogs, and Pinterest are among the most widely used social media platforms in academic libraries. According to Aichner (2015), social media technologies include blogs, business networks, enterprise social networks, forums, microblogs, photo sharing, product/service reviews, social bookmarking, social gaming, social networks, video sharing and virtual worlds. Ezeani and Igwesi (2012) found out in their studies that Facebook and WhatsApp were the most commonly used platforms in Nigerian academic libraries due to their accessibility and ease of use. Similarly in a study carried out by Bakare, Yacob and Umar (2018), one of the findings revealed that librarians deliver library services using social media platforms like Facebook, Twitter, Blog and WhatsApp. Likewise, Adewojo and Mayowa-Adebara (2016) revealed that library staff mostly use WhatsApp and Facebook daily in rendering services to users. Omini and Osuolale (2019) also found out that academic libraries mostly used Facebook and blog to promote library resources and services. Service delivery is fundamental to libraries. Agoh and Omekwu (2021) described library and information service delivery as library processes and activities that are deployed by libraries to deliver information services and resources to library users, with the aim of enhancing the activities and productivity of library users. It is not surprising that library staff in academic libraries deliver library and information services using social media to help meet the information needs of library users. Ezeani and Igwesi (2012) in their studies found out that social media enhance library services by enabling real-time communication, virtual reference services, and current awareness services. Oyeniran and Olajide (2019) discovered that reference services, marketing of information produce and services, strategic dissemination of information, exhibition and display of new arrivals, display of reading lists, online registration of users, among others are various services rendered via social media in the library. Obi, Okore and Kanu (2019) pointed out that answering reference questions, user education, current awareness services, alert users due, display and exhibition, document delivery services and circulation services are library services rendered with social media. Social media platforms provides numerous benefits to academic libraries including improved communication, enhanced promotion of resources and enhances user engagement. Ogunjobi et al (2017) noted the following as the benefits of using social media in libraries:

- It promotes library services and disseminates news quickly, delivering this information more directly to library users;

- It helps gather feedback to enhance user services;
- Financially the cost of using social media are perceived to be low;
- It requires little training;
- It increases engagement interactions with library clientele;
- The promotion of library holdings via social media can help increase usage of information resources;
- It enhances communication both within the library and with other departments;
- It can be used for outreach activities through onward sharing, well beyond the institution itself, helping building connections and reputation more proudly.

There are some challenges impeding proper application of social media by library staff for service delivery in academic libraries. Emmanuel and Osuolale (2019) identified high cost of internet connectivity, lack of interest in utilizing internet services, low patronage of internet service, and paucity of well-trained library staff on utilization of social media platforms as constraints to effective use of social media in tertiary institutions. They also added that poor attitude towards social media platforms, low bandwidth and constant epileptic power supply in accessing internet connectivity are among the constraints. Ezeani and Igwesi (2012) noted that issues bordering on apathy, lack of awareness, insufficient bandwidth, phobia and desire to embrace this new technology inhibit use of social networking in most libraries especially in developing countries. Furthermore, Danbaki, Mohammed, Gado and Ikegwuiro (2020) maintained that lack of finance, limited bandwidth, lack of proper training of library staff in the area of using social media, low level of technology penetration, unreliable power supply and poor network connectivity are challenges facing social media use by Nigerian tertiary institution libraries. Lack of awareness, bandwidth problem, technophobia, lack of maintenance culture, unreliable power supply, lack of staff training and copyright issue are challenges librarians face in using social media (Oyeniran & Olajide, 2019). These challenges hinder proper utilization of social media in service delivery in libraries.

Methodology

The study adopted a descriptive survey research design. Simple random sampling technique was used in the selection of respondents for the study. The population of the study was made up of professional librarians selected from six (5) academic libraries in Imo State namely: Federal University of Technology, Owerri , Imo State University, Alvan Ikoku Federal University of Education , Kingsley Ozurumba Mbadiwe University and Federal Polytechnic Nekede. The instrument used for data collection was a questionnaire titled: Questionnaire on Digital Platforms Connections: How Academic Libraries in Imo State Are utilizing Social Media for library service delivery. The questionnaire consisted of two parts. Section A consisted of items on the respondents' bio-data, such as age, gender, and academic qualification, years of experience while Section B addressed issues related to the research objectives. The questionnaire link was share on the different institutional platforms and on the NLA, Imo State chapter general platform. A total of 85 respondents participated in the survey and their responses made up the sample size for this study. The data collected through Google forms were automatically exported to Google sheets for analysis. The data were analyzed using Data generated from the study were analyzed using mean (x) scores and descriptive statistical tools. Items with values of 2.50 and above respectively were positively interpreted, while items with values below 2.50 were negatively interpreted. A total of 85 copies of questionnaire were completed and returned through Google forms, representing a 100% response captured and analyzed.

Results /Findings

Analysis of data of bio data

Table 1: Institutions

Institutions	Frequency	Percentage (%)
Alvan Ikoku Federal University of Education	15	17.6
Federal Polytechnic Nekede, Owerri	11	12.9
Federal University of Technology, Owerri	43	50.6
Imo State University, Owerri (IMSU)	10	11.8
Kingsley Ozurumba Mbadiwe University, (KOMU)	6	7.1
Total	55	100

Table 1 above revealed that Federal University of Technology, Owerri (FUTO) had a response rate of 43 (50.6%), Alvan Ikoku Federal University of Education (AIFUE) had 15 (17.6%) respondents while Federal Polytechnic Nekede had 11(12.9%) respondents. Imo State University (IMSU) had 10 (11.8 %) and Kingsley Ozurumba Mdadiwe Univeristy (Komu) had 6 (7.1 %) The table revealed that Federal University Technology, Owerri had the greatest number of respondents.

Table 2: Distribution of Respondents by Gender

Genger	Frequency	Percentage (%)
Male	34	40
Female	51	6o
Total	55	100

Table 2 above revealed that most of the respondents were females 51 (60 %) and the remaining 34 (40%) were males. The table revealed that there were more female librarians their counterparts. This finding is not surprising as most men perceived librarianship as a female career.

Table 3: Academic Qualification

Academic Qualification	**Frequency**	**Percentage (%)**
Ph.D	30	35.3
MLS.MSc.	28	32.9
BLS.BSc.	17	20
HND	10	11.8
TOTAL	85	100

Table 3 above shows that 30 (35.3 %) of the respondents were Ph.D. holders . followed by 28 (32.9 %) of the respondents who had MLS/ MSc. certificate. BLS/BSc. holders had 17 (20%) respondents while HND holders had 10 (11.8 %). The table revealed that most of the respondents possessed Postgraduate qualifications. This suggest that the respondents were academically qualified to provide reliable information on the study.

Table 4: Designation of respondents

Designation of respondents	Frequency	Percentage (%)
University Librarian	1	1.2
Deputy University Librarian	13	15.3
Senior Librarian	25	29.4
Librarian I	17	20
Librarian II	10	11.8
Assistant Librarian	11	12.9
Graduate Assistant	8	9.4
Total	85	100

Table 4 above , revealed that Senior librarians and Librarian I had 25 (20.4%) and 17 (20%) number of respondents followed by Deputy Librarians (13 (15.3%) and Assistant librarians 11 912.9). The table also revealed that librarian II had 10 (11.8 %) number of respondents and 8 (9.4%) were Graduate Assistants while only 1(1.2%) of the respondents was a University Librarian.

Table 5: **Years of experience**

Years of experience of the respondents	**Frequency**	**Percentage (%)**
1-5	18	21.2
6 - 10	19	22.3
11 - 15	23	27.1
16 years and above	25	29.4
Total	55	100

Table 5 revealed that most of the respondents 25 (29.4%) had 16 and above years of experience while 23 (27.1 %) of the respondents had 11- 15 years' experience. It also revealed that 19 (22.3%) of the respondents had 6-10 year experience while 18 (22.3%) had 1 - 5 years of experience. The table revealed that most of the respondents had more than 16 years. This suggests that most of the participants in the study were quite experienced in terms of services delivery in library and library operations.

Analysis of Research Questions

Research Question 1

What type of social media platforms are used in academic libraries in Imo State?

Table 6: Type of social media platforms

Social media	Frequency	Percentage (%)
Facebook	41	74.5
WhatsApp	49	89.0
Twitter	26	47.2
Instagram	18	32.7
You Tube	22	40
Telegram	18	32.7
Linkedin	9	16.4
Library Blog	8	14.5

Table 6 above was used to answer research question 1 on types of social media technologies. The table showed that whatsApp 49(94.2%) and Facebook 41 (78.8%) are often used. This was followed by twitter 26 (50%) and You Tube 22(42.3 %). Next was Instagram and telegram with the same respondents 18(34.6%) while linkedin and library blog had 9(17.3%) and 8(154%) respondents respectively. This table revealed that many librarians used WhatsApp and Facebook while the use of other social media platforms for the delivery of services among the librarians studied is at a low ebb.

Research Question 2: What are the services librarians used social media tools for in academic libraries?

Table 7: Services delivered via Social Media Platform

Item	Frequency	Percentage (%)
Current awareness	44	80
Reference Services	38	69.0
Dissemination Services	45	82.0
Promotion of Library Resources	31	56.3
Announcements / Events	27	49.0
Virtual Services/ Chat services	24	43.6
User Education	23	41.8

Table 7 above answers research question 2 on services rendered through social media platforms. The table revealed that most of the respondents indicated that they used social media to deliver the following services Dissemination of information, current awareness and reference services 45 (86.5%) , 44 (84.6%)and 38 (73.1%) respectively. The table also revealed that few of the respondents indicated that they used social media to deliver the following service: promotion of library resources 31(59.6%), Announcements / events 27 (51.9%), visual assistants / chat service 24 (46.2%) while User education had the least 23(44.2%).

Research Question3**: What are the purposes of using social media platforms in academic libraries?**

Table 8: Mean Ratings on purposes of using social media platforms in academic libraries

S/N	Item	Strongly Agree	Agreee	Disagree	Strongly Disagreee	Mean ($\bar{X}$)	Decision
	To communicate with users	37	43	5	-	3.4	Agree
	To promote Library resources and services	35	48	2	-	3.4	Agree
	To provide quick access to information	55	27	3	-	3.6	Agree
	To increase user's engagement	48	35	2	-	3.5	Agree

To support teaching and research	37	45	3	-	3.4	Agree
To enhance visibility of library services	57	26	2	-	3.6	Agree
Grand mean					3.5	Agree

Table 8 above was used to answer research question 3. The table revealed most of the respondents agreed that social media platforms are used for communicating with users, promoting library resources and services, providing quick access to information, increasing users' engagement, supporting teaching and research and also enhancing library visibility. The grand mean of 3.22 confirms that social media platforms are widely utilized for these purposes in academic libraries.

Research Question 4**: What are the benefits of social media platforms usage in academic library?**

Table 9: Mean Ratings on Benefits of Social Media Usage

Item	**Strongly Agree**	**Agree**	**Disagree**	**Strongly Disagree**	**Frequency** ($\bar{X}$)	**Decision**
Improves communication with Users	45	37	3	-	3.5	Agree
Increases awareness of library services	50	33	2	-	3.6	Agree
Faster information dissemination	55	28	2	-	3.6	Agree
Wider outreach to users	57	26	2	-	3.6	Agree
Enhances user engagement	58	24	3	-	3.6	Agree
Grand mean					3.6	Agree

Table 9 was used to answer research question 4. The table revealed that most of the respondents agreed that social media usage improves communication with users, increases awareness of library services, enables faster dissemination of information, broadens user outreach, and enhances user engagement. The grand mean of 3.18 indicates that social media contributes significantly to effective service delivery in academic libraries in Imo State.

Research Question 5: **What are the challenges encountered by librarians in using social media platforms?**

Table 10: Mean Ratings on Challenges encountered in Social Media Usage

Item	**Strongly Agree**	**Agree**	**Disagree**	**Strongly Disagree**	**Mean** ($\bar{X}$)	**Frequency**
Poor internet connectivity	45	25	5	10	3.2	Agree
Irregular power supply	48	23	7	8	3.3	Agree
Inadequate funding	55	25	5	0	3.5	Agree
Lack of trained ICT staff	48	22	9	6	3.3	Agree
Lack of institutional policy	45	34	4	2	3.4	Agree
Grand Mean					3.3	Agree

Table 10 above was used to answer research question 5 on challenges encountered in the use of social media platforms. The table revealed that poor internet connectivity, irregular power supply, inadequate funding, lack of trained ICT staff and lack of institutional policy are major challenges affecting effective use of social media platforms in academic libraries in Imo State. The grand mean of 3.20 indicates that these challenges are prevalent among the libraries studied.

Discussion of Findings

Social media technologies used by librarians in academic libraries

The study revealed that WhatsApp, Facebook and Twitter (X) were the mostly used types of social media platform by librarians in academic libraries in Imo State. While Instagram, YouTube, Telegram were sparingly used. The finding is in tandem with the findings of Bakare, Yacob and Umar (2018) and Omini and Osuolale (2019 who revealed in their findings that librarians deliver library services using social media platforms like Facebook, Twitter, Blog and WhatsApp.

Services Delivered Through Social Media Platforms

The findings showed that librarians employ social media platforms to provide current awareness services, reference services, user education, selective dissemination of information, library orientation, and promotion of library resources and services. The finding of this study corroborates that of Oyeniran and Olajide (2019) who identified the services

delivered by library staff using social media as reference services, marketing of information produce and services, strategic dissemination of information, exhibition and display of new arrivals, user education, and current awareness services. It also corroborate the findings of Ezeani and Igwesi (2012) who found out in their studies \that social media enhances library services by enabling real-time communication, virtual reference services, and current awareness services Service delivery is fundamental to libraries.

Purposes of Using Social Media Platforms in Academic Libraries

The study revealed that librarians use social media technologies to communicate with users, promote library resources and services, provide quick access to information, support teaching and research, enhance user engagement, and increase the visibility of library services. This finding is consistent with the study of Ezeani and Igwesi (2012) who reported that social media technologies have become important tools for information sharing, collaboration, and user engagement in libraries. Similarly, Aharony (2012) found that librarians increasingly adopt social networking technologies to enhance communication with users and improve access to information resources.

Benefits of Social Media Usage in Academic Libraries

The findings revealed that social media usage improves communication with users, increases awareness of library services, enhances information dissemination, broadens user outreach, and promotes user engagement. This finding supports the assertions of Ogunjobi et al (2017 who found that social media technologies enhance interaction between libraries and users and facilitate effective dissemination of information. The result suggests that social media platforms provide libraries with opportunities to improve service quality and meet the evolving information needs of users.

Challenges Encountered in the Use of Social Media Platforms

The study revealed that poor internet connectivity, irregular power supply, inadequate funding, lack of trained ICT personnel, and absence of institutional policies constitute major barriers to the effective utilization of social media technologies in academic libraries.

This finding affirms with the findings of Emmanuel and Osuolale (2019), and Ezeani and Igwesi (2012) who stated that epileptic power supply, lack of ICT skills, poor maintenance culture and lack of government intervention amongst to others greatly affected social media use. Indeed the action and support by the government, library institutions and librarians are all required for effective deployment of social media networks for enhanced information service delivery. The findings of the study also reveal that poor internet connectivity, irregular power supply, inadequate funding, lack of trained ICT staff and lack of institutional policy are the major challenges encountered in the use of social media platforms

Conclusion

Based on the findings of the study, it is concluded that social media platforms play a significant role in enhancing service delivery in academic libraries. The technologies are widely utilized for communication, promotion of library resources and services, dissemination of information, user engagement, and support for teaching and research activities. The study further concludes that social media usage provides numerous benefits, including improved communication, increased awareness of library services, wider outreach, and enhanced interaction between librarians and users. Therefore, for academic libraries to maximize the benefits of social media platforms, there is a need for improved infrastructure, adequate funding, staff training, and supportive institutional policies. However, to maximize their benefits, libraries must address existing challenges and invest in capacity building. The future of academic libraries in information service delivery depends not only on adopting digital platform connections but also on cultivating active digital communities centred on learning, access and collaboration.

Recommendations

Based on the findings and conclusions of the study, the following recommendations are made

- University management should provide adequate funding for the acquisition of ICT infrastructure, internet facilities, and social media management tools required for effective service delivery.
- Regular training and capacity-building programmes should be organized for librarians to enhance their competencies in the use of social media technologies and digital communication tools.
- Reliable internet connectivity and alternative power supply systems should be provided to ensure uninterrupted access to social media platforms and online library services.
- Institutional policies and guidelines on social media usage should be developed to regulate and support the effective use of social media technologies in academic libraries.

Abstract

This study examined digital readiness and service innovation in selected academic libraries in Ebonyi State, Nigeria. Specifically, the study assessed the availability and adequacy of digital infrastructure, librarians' digital competencies, the extent of digital service innovation, the perceived impact of digital readiness on service innovation, and associated challenges. A descriptive survey research design was adopted. The study's population comprised of 125 librarians, who were all included using a total enumeration sampling technique. Structured close-ended Google Foirm designed questionnaire was used as the instrument for data collection. The instrument was distributed with link shared via the WhatsApp group of NLA members in Ebonyi State. 106 valid responses were recorded and analyzed using descriptive statistics. The findings revealed that while basic ICT infrastructure is available, advanced digital infrastructure is largely inadequate, thereby limiting the delivery of innovative library services. Librarians were found to possess basic digital competencies; however, significant gaps exist in advanced digital skills required for contemporary service innovation. The extent of digital service innovation was generally low across the libraries. Despite this, respondents acknowledged that digital readiness has a significant positive impact on service innovation. Key challenges include inadequate funding, insufficient management support, poor infrastructure, and limited opportunities for professional training. The study concludes that improving digital readiness is essential for enhancing service innovation in academic libraries. It recommends increased investment in digital infrastructure, continuous capacity building for librarians, and the promotion of an institutional culture that supports innovation and technological advancement.

Keywords: **Digital Readiness, Service Innovation, Academic Libraries**

Introduction

Modern academic libraries are not just repositories of knowledge and nerve centres for intellectual development in higher institutions, they are centres for the incubation of novel ideas birthed by the fusion of innovativeness and timely and efficient service delivery philosophy. The 21st century 5th Industrial Revolution information landscape has continued to influence information services delivery in such a manner which academic libraries cannot afford to ignore or neglect. Therefore, proper attention is required by libraries and information professionals to enhance the provision of reliable, timely, current, and appropriate information to their users in the most ethical and contemporary manner.

Iroeze (2021) opines that the academic library has become an indispensably instrumental subsystem of the tertiary institution in the promotion of literacy and quality education for the users of the library. The target group of users includes faculty, staff, students, and its immediate environment (Hotsonyame, 2023). This fact underpins the establishment of libraries in academic institutions to facilitate the speedy realization of the education mandates of their parent bodies by equipping members of the academic with the critical knowledge needed for the attainment of the objectives of the parent body, and by extension, societal goals (Ilo, Nkiko, Izuagbe, & Furfuri, 2020).

The institutional objectives of academic institutions expand with societal demands for development, and as the expansion of the information society continues to experience rapid exponential changes through the emergence and domination of digital technologies, the library environment is also expected to align with contemporary trends in order to continue to sustain its mandate. This is why Idiegbeyan-Ose and Idahosa (2025) assert that digital technologies have the power to transform Nigerian academic libraries into vibrant hubs of innovation and learning. This position can only be attained if the library is in possession of personnel with the right technical know-how to deliver the contemporary services that are commensurate with the needs of the users through the efficient and result-oriented use of digital technologies. It therefore becomes necessary to evaluated the digital readiness and the innovativeness in the services delivery of the academic library in Nigeria in order to meet the expanding societal and institutional goals.

Granicus (2026) defines digital readiness as an organization's preparedness to adopt and implement digital technologies, focusing on the foundational infrastructure, skills, and tools needed to start digital transformation. Baidoo and Nwagwu (2024) had earlier noted that technology readiness relates to the preparedness to effectively use modern technologies and new equipment, tools, devices and software. It includes the readiness of a technology-oriented innovation to effectively deliver the services for which it was established. It is considered crucial for public sector organizations (including academic libraries) as it ensures they can effectively deliver accessible, efficient, and secure services in a rapidly evolving digital landscape (Granicus, 2026). The above explanation links the main objective of digital readiness to the delivery of accessible, efficient and secure services in a distinctively rapidly evolving digital

information landscape, which the current library environment is an integral part of. In the context of librarianship, Emmatrice and Ekoko (2025) explain that digital readiness refers to the extent to which librarians possess the knowledge, skills, attitudes, and institutional support necessary to adopt and effectively use emerging technologies in library operations. Library and Information Science, being a service-oriented filed among other information professions lays great emphasis on user satisfaction through service delivery. Umoh (2017) states that to facilitate academic success, academic libraries must provide access to a broad range of information resources and services.

Service delivery in the context of academic libraries is the process of providing access to various resources using cyber-physical systems and intelligent technology poised to improve user experience and efficiency for staff in pursuit of excellence and effectiveness (Modiba & Chisita, 2023). Innovation on the other hand is described by Colaklar (2014) as the synthesis of new ideas and thoughts which will re-construct or re-combine present things, and it is an inner feature of human. Meanwhile, innovative library service delivery involves a multifaceted range of activities and practices, requiring a user-centered approach, integration of modern technologies, diverse and inclusive collections as well as active community engagement, by continuously adapting to the changing needs of library patrons and embracing innovative solutions (Osisanwo & Adeola, 2024). These services are crucial for academic libraries to fulfill their roles as community hubs, educational support centers, and repositories of knowledge of its parent bodies.

The modern information econsystem is getting more complex, competitive and complicated. Thus, librarians cannot afford not to innovate in their services delivery. Having established the vital role played by technology in innovativeness in the digital information landscape, it is important to evaluate the preparedness of Nigerian academic libraries to integrate digital technologies in their present services delivery towards service innovation. Ebonyi State, one of Nigeria's youngest states is one of such states where a large number of academic institutions are relatively new compared to other older states with longer years of experience in academic library services delivery. Thus, the status of readiness for innovation among the libraries remains relatively unknown. This research seeks to examine the digital readiness and service innovation in selected academic libraries in Ebonyi State, with emphasis on their implications for the future of librarianship in Nigeria, especially as the struggle for sustained relevance of librarianship among other information professions continues to be intensified.

Statement of the Problem

Academic libraries worldwide are undergoing rapid transformation driven by advances in digital technologies, evolving user expectations, and the growing demand for innovative information services. This is already well-established in academic libraries in developing countries. In Nigeria, this shift is particularly significant as libraries strive to remain relevant in an increasingly digital knowledge environment. Despite these changes, many academic libraries especially in developing countries like Nigeria, based on observed anedoctal experiences and revelations in literature, appear to face challenges related to digital readiness, including inadequate technological infrastructure, limited funding, competent staff, and resistance to change (Khan, 2020; Onunka, Onunka, Fawole, Adeleke, Daraojiba, 2023; Shahzad, Ahmed and Khan, 2025). These challenges may hinder abilities of these libraries to effectively adopt and implement innovative services that meet the needs of 21st-century users and the attainment of the institutions the libraries serve.

There is a growing concern that many academic libraries in Nigeria including those in Ebonyi state may not be adequately prepared to leverage emerging digital technologies such as digital institutional repositories, virtual reference services, makerspace, and automated library systems. Observation reveals that services offered by many of the libraries appear to be basically traditional. For instance, Okunlaya, Abdullah and Alias (2022) report low adoption rate by the university libraries in adopting Artificial intelligence (AI) to provide innovative alternative services due to absence of such technologies in their strategic plan for service delivery. This suggests the existence of a gap between digital readiness and service innovation, which raises critical questions about the future of librarianship in Nigeria. If academic libraries in Ebonyi State are unable to adapt to the digital environment, they risk becoming obsolete in the face of alternative information providers. While several studies have examined ICT adoption in Nigerian libraries, there is limited empirical evidence specifically linking digital readiness to service innovation within the context of academic libraries in Ebonyi State.

Therefore, the problem of this study lies in the unclear extent to which digital readiness influences service innovation in selected academic libraries in Ebonyi State, and how this relationship impacts the future role and relevance of librarianship in Nigeria. Addressing this gap is essential for informing policy, improving practice, and ensuring that academic libraries remain dynamic and responsive to the evolving information landscape.

Objectives of the Study

The main objective of the study is to examine the **digital readiness and service innovation in selected academic libraries in Ebonyi State, and the implications for the future of librarianship in Nigeria. The specific objectives are to:**

i. **Assess the availability and adequacy of digital infrastructure** in the selected academic libraries in Ebonyi State
ii. **Determine the level of digital competencies of librarians** in the selected academic libraries in Ebonyi State.

iii. **Examine the extent of digital service innovation** in the in the selected academic libraries in Ebonyi State

iv. **Analyse the perceived impact of digital readiness on service innovation** in the selected academic libraries in Ebonyi State

v. **Identify challenges hindering digital readiness and service innovation** in the selected academic libraries in Ebonyi State

Literature Review

A number of related studies have been conducted on digital readiness in academic libraries. Salamzadeh, Damij, Issa and Khaan (2026) note that digital readiness is an organization's ability to adapt to and leverage digital technologies effectively, including its infrastructure, processes, workforce skills, and cultural mindset. A digitally ready organisation is said not only to possess the requisite technological infrastructure (or tries to gain them) but also cultivates a culture of innovation, transformation and agility**. According to Granicus (2026), digital readiness is measured with metrics such as** digital infrastructure readiness, digital skills and workforce readiness, technology adoption rate, data management capabilities, user experience and engagement, regulatory compliance and risk management, innovation and agility, and cost efficiency. Some of these metrics are considered vital to the current study.

Çolaklar (2014) defines innovative library services as new, improved, or repurposed, methods and technologies adopted by libraries to enhance user engagement, information access, and service delivery beyond existing traditional models. These initiatives leverage on contemporary technology, such as digital platforms, AI, and augmented reality, and community-focused programming to meet evolving user information needs in the digital age. Some of the services that arise from innovativeness in academic libraries, according to Colaklar (2014) include interactive programmes to enhance research and learning culture, author activities, interviews, seminars, exhibitions, and events, theatre, cinema and film shows, assistance in job searching and career planning, social responsibility projects, supportive programmes for distant learning, retrospective conversion and digitisation, faculty-librarian collaboration, information literacy, organization of creative writing courses, among others.

Baidoo and Nwagwu (2024) examined user and service provider assessment of technology readiness of library commons in selected universities in Ghana. The study found significant relationships between the availability of technological learning resources and users' experience, use and satisfaction with the commons. This is corroborated by Emmatrice and Ekoko (2025) who also studied librarians' readiness for the adoption of emerging technologies and sustainable funding of university libraries in two states in South-South, Nigeria, and reported a significant positive relationship between librarians' digital readiness and effective technology adoption. Similarly, Idhalama, Oredo, and Makori (2025) who evaluated the availability and accessibility of digital resources and services in public university libraries in Nigeria reported that there is a significant evidence of digital infrastructural deficit prevalence among public university libraries in Nigeria. This reported infrastructural deficit remains some of the major challenges that have hindered digital readiness and service innovations in academic libraries.

On the issue of digital literacy skills of librarians needed for digital readiness and service innovation, Dube, Rammutloa and Matatiele (2024) reports that the needed digital literacy skills for the contemporary academic librarians are troubleshooting skills, scholarly communication (including e-publishing) skills, self-training skills, digital pedagogical skills, AI skills, mentorship and teamwork skills, digital content creation and management skills, coding skills and database management skills, research citation and mapping skills, data curation and management skills, videoconferencing skills, metadata management skills, web navigation skills, among others. Meanwhile, when the impact of such skills were examined by Okoro and Musa (2025) in a study on digital literacy skills and innovative service delivery in university libraries in North-West, Nigeria, the findings revealed that digital literacy skills had a positive significant impact on innovative service delivery. Also, Hamad, Al-Fadel, M, and Shehata (2024) studied the level of digital competencies for the provision of smart information service at academic libraries in Jordan. The results indicated a strong and positive relationship between the level of smart information services at the investigated libraries and the level of digital competencies among the librarians. While these studies examined the digital competence and its impact on service innovation, none was focused on Ebonyi State, establishing a major gap for the current study.

In a cross-sectional survey, targeting entry-level librarians across Nigerian universities, Oladokun, Ogunjimi, Oyetola, Orubebe, and Enakrire (2025) conducted a study titled "Library management in an era of disruption: assessing skills and knowledge of future academic librarians in Nigeria". The findings revealed a moderate level of awareness of digital technologies, and a lack of preparedness to adopt innovative practices. Conversely, Okeji, Tralagba and Obi (2020) conducted an investigation of the digital literacy skills and knowledge-based competencies among librarians working in private and public university libraries in Nigeria. The study revealed that almost half of the librarians rated their level of digital literacy skills to be moderate. Only few librarians rated their digital literacy skills to be excellent. The findings of the two studies reviewed above reemphasise the challenge associated with the gaps created by inadequate digital competence among Nigerian academic librarians.

Etebu and Zacchaeus (2020) assessed innovative library services (ILS) in different types of libraries in Bayelsa, State, Nigeria. The findings revealed that the innovations in the libraries studied include online business support service for starts-up; web design services; blogging service; podcasting service; electronic publishing services; online

information search service; short message alerts services; online training and workshops; digital references services; database production/distribution services; online entertainment services; mobile application services and digital marketing service. The findings imply that most of the contemporary innovativeness in contemporary libraries are influenced by digital technologies. **This is further emphaised by** Omeluzor, Ugochi, and Izuakolam (2020) and Potiskum and Abdullahi (2025) who asserted that the adoption of technological tools in libraries to deliver services can promote innovation in services delivery.

Baidoo and Nwagwu (2024) reported that library/commons managers identified key digital preparedness challenges such as inadequate planning and poor space allocation. Furthermore, negative feelings among library/commons managers, such as insecurity, resistance to change and low confidence were identified as challenges to digital preparedness in libraries. These challenges are also similar to the findings of Etebu and Zacchaeus (2020), Atchrimi and Ogunbodede (2024), and Idhalama, Oredo, and Makori (2025) who revealed that inadequate funding, inadequacy of specific skills, inadequate deployment of ICT infrastructure, unstable power supply, and resistance to change were some of the challenges identified as hindrances to innovative library services in Nigeria.

To address the numerous challenges affecting the integration of modern digital technologies to enhance digital readiness in academic libraries, Dube, Rammutloa and Matatiele (2024) reported that academic libraries should develop strategies to expose librarians to novel technological competencies that align with the goals of the institution, enhance investment in technology adoption, and embark on strategic policy reviews, while Adeoye, Oladokun, and Opalere (2022) suggest that libraries should explore and maximise the use of open source technologies such as social media to enhance their readiness for digital reference services delivery, while encouraging continuing capacity development and reorientation for librarians concerning the use of digital devices and online tools to eliminate any phobia for the use of digital technologies among librarians.

In terms of the future implications of digital readiness in Nigerian libraries, as noted by Fasola, Oyadeyi and Iyoro (2024), tapping into the potential of digital technologies such as blockchain technology has the potential to revolutionize library services by enhancing their efficiency, security, and transparency. **However, Owolabi, Yemi-Peters, Oyetola, Bello and Oladokun (2022) revealed that the readiness of university libraries in Nigeria towards the adoption of robotics technology is nothing to write home about. This has a negative implication for the delivery of innovative information services in Nigerian university libraries. Odunlade and Ojo (2023) who studied the pre-and post COVID digital transformation in Nigerian university libraries also revealed** that digital transformation is yet to be fully embraced in Nigerian university libraries, as there is no significant change in the use of digital technologies in the deployment of library services in Nigerian academic libraries pre and post COVID-19 era. The implication of this for the future of library services delivery, as reported by **Odunlade and Ojo (2023),** is that digital transformation may yet remain an illusion even when the global narrative is already tending towards 5th industrial revolution, unless strategic steps are taken to resolve the challenges such as paucity of funds, power issues, inadequate personnel digital competence, and policy issues associated with the transformation of academic library services in Nigeria.

While the available empirical studies revealed that there is adequate studies on digital readiness from the perspective of other regions in and outside Nigeria, there is an obvious empirical gap on digital readiness and service innovation in the context of Ebonyi State academic libraries. The geographical gap in literature lends credence to the need for the current study, as it seeks to determine peculiarities or general relationships with current trends reported in literature, thereby providing contextual approach to the situation in Ebonyi and providing a general.

Methodology

This study adopted a descriptive survey research design, with a population of 125 library staff from five (5) selected academic libraries; Alex Ekwueme Federal University Library, Ndufu-Alike (42), Akanu Ibiam Federal Polytechnic Library Unwana (35), Ebonyi State University Library (27), Ebonyi State College of Education (12), and Evangel University Library (9). These institutions were selected to ensure a balanced spread among the three types of academic institutions in state (University, Polytechnic, and College Libraries), the ownership structures of these institutions which is federal, state and private tertiary institutions. More university libraries were also selected for a balanced representation since there more universities than other types of tertiary institutions in the state. Total enumeration sampling was used since the population was manageable. An e-questionnaire designed with the use of Google Form was used to collect data from the respondents through the official WhatsApp group of Ebonyi State Chapter of the Nigerian Library Association. 106 of the responses, representing 84.80% of the expected 125 responses were recorded on time for data analysis. This formed the basis of data analysis for the study. The data in the research question part of the questionnaire were analysed with descripotive statistics, with 2.5 as the acceptable benchmark for the 4-point rating scale adopted by the study, since 2.5 is the average mark for points rated 4, 3, 2, and 1. This means 4+3+2+1=10. Thus, 10/4 (points) = 2.5. This implies that point scored below 2.5 will be decided as “rejected”, while those from 2.5, and above will be decided as “accepted”.

Data Analysis and Discussion of Findings

Section A (Demographic Data)

Table 1: Gender

SN	Gender	Frequency	Percentage%
A	Male	62	58.48
B	Female	44	41.50
	Total	106	100

Table 1 shows that 62 (58.48%) of the respondents are male librarians while 44 (41.50%) of the respondents are female. This shows that there are more male librarians in the selected academic libraries.

Table 2: Institution

SN	Institution	Frequency	Percentage
A	Akanu Ibiam Federal Polytechnic Library Unwana	29	27.35
B	Alex Ekwueme Federal University Library	38	35.84
C	Ebonyi State College of Education Library	10	9.43
D	Ebonyi State University Library	23	21.69
E	Evangel University Library	6	5.66
	Total	106	100

Table 2 shows that respondents were drawn from five academic libraries in Ebonyi State. The largest proportion of respondents, 38 (35.84%), were from Alex Ekwueme Federal University Library, followed by 29 (27.35%) from Akanu Ibiam Federal Polytechnic Library, Unwana. Ebonyi State University Library contributed 23 (21.69%) respondents, while Ebonyi State College of Education Library and Evangel University Library contributed 10 (9.43%) and 6 (5.66%) respectively.

This indicates that the study had wider representation from federal institutions, particularly Alex Ekwueme Federal University, suggesting a stronger response rate from larger or more established academic libraries.

Table 3: Division

SN	Division	Frequency	Percentage
A	Readers' Services	61	57.54
B	Technical Services	29	27.35
C	Others	16	15.09
	Total	106	100

Table 3 reveals that the majority of respondents, 61 (57.54%), were from the Readers' Services division. Technical Services accounted for 29 (27.35%), while 16 (15.09%) were from other units. This implies that most respondents are directly involved in user services, which strengthens the validity of responses related to service delivery and digital innovation in libraries.

Table 4: Highest Academic Qualification

SN	Highest Academic Qualification	Frequency	Percentage
A	ND/Diploma	17	16.03
B	HND/BSc/BLIS	53	50
C	MLIS/MSc	31	29.24
D	PhD	5	4.71
	Total	106	100

Table 4 indicate that half of the respondents, 53 (50%), possess HND/BSc/BLIS qualifications. This is followed by 31 (29.24%) with MLIS/MSc degrees, while 17 (16.03%) hold ND/Diploma qualifications. Only 5 (4.71%) possess PhDs.

This suggests that the workforce is predominantly composed of first-degree holders, with relatively low representation of doctoral-level professionals, which may have implications for advanced digital innovation and research capacity in the libraries.

Section B (Research Questions)

Table 5: Research Question 1: What is **the extent of availability and adequacy of digital infrastructure** in the selected academic libraries in Ebonyi State? VHE: Very High Extent (4); HE: High Extent (3); LE: Low Extent (2); VLE: Very Low Extent (1).

SN	Availability and adequacy of digital infrastructure	VHE	HE	LE	VLE	Total	Mean	Decision
A	**Digital Institutional Repositories**	5(4.71)	9(8.49)	49(46.22)	43(40.56)	106 (100)	1.77	Rejected
B	**Digital Maker Spaces and Multimedia Laboratories**	21(19.81)	23(21.69)	32(30.18)	30(28.30)	106 (100)	2.33	Rejected
C	Library Management Systems (LMS)	8(7.5)	13(12.26)	36(33.96)	49(46.22)	106 (100)	1.81	Rejected
D	Radio Frequency Identification (RFID) Technologies	10(9.43)	12(11.32)	48(45.28)	36(33.96)	106 (100)	1.96	Rejected
E	Extended Reality(XR) e.g. Virtual Reality (VR), Augmented Reality (AR), and Mixed Reality (MR)	15(14.15)	14(13.20)	56(52.83)	21(19.81)	106 (100)	2.21	Rejected
F	Blockchain Technologies	8(7.5)	13(12.26)	36(33.96)	49(46.22)	106 (100)	1.81	Rejected
G	Web Server and High Speed Networking e.g. Wi-Fi and Li-Fi	49(46.22)	43(40.56)	5(4.71)	9(8.49)	106 (100)	3.24	Accepted
H	Cloud Computing Technologies	14(13.20)	17(16.03)	45(42.45)	30(28.30)	106 (100)	2.14	Rejected
I	Internet of Things Technologies	12(11.32)	13 (12.26)	33 (31.13)	48(45.28)	106 (100)	1.89	Rejected
J	Contemporary Digital Hardware e.g. Laptops, desktops, printers, scanners, multimedia projectors, etc.	33 (31.13)	48(45.28)	12(11.32)	13 (12.26)	106 (100)	2.95	Accepted
K	Digital Accessibility Platforms e.g. Online Public Access Catalogue, WebPAC, Databases, etc.	10(9.43)	12(11.32)	48(45.28)	36(33.96)	106 (100)	1.96	Rejected
L	Library Websites and Portals	19(17.92)	14(13.20)	36(33.96)	37(34.90)	106 (100)	2.14	Rejected
M	Assistive Laboratories and Technologies e.g. Text-to-Speech tools	10(9.43)	12(11.32)	48(45.28)	36(33.96)	106 (100)	1.96	Rejected

Table 5 shows that most digital infrastructure components are available at a **low extent**, as evidenced by mean scores below the acceptance benchmark. Specifically, digital institutional repositories (Mean = 1.77), LMS (1.81), RFID (1.96), IoT (1.89), and blockchain technologies (1.81) were all rated low. Emerging technologies such as Extended Reality (Mean = 2.21) and cloud computing (2.14) also recorded low availability. However, two components stood out. Web servers and high-speed networking (Mean = 3.24) and Contemporary digital hardware (Mean = 2.95). These were accepted, indicating that basic ICT infrastructure is relatively available. Overall, the result implies that while foundational technologies are present, while advance and emerging digital infrastructure is largely inadequate in the selected academic libraries.

Table 6: Research Question 2: What is **the level of digital skills/competencies of librarians** in the selected academic libraries in Ebonyi State? VHE: Very High Level (4); HE: High Level (3); LE: Low Level (2); VLE: Very Low Level (1).

SN	Level of digital competencies of librarians	VHL	HL	LL	VLL	Total	Mean	Decision
A	Digital curation skills	13 (12.26)	12(11.32)	48(45.28)	33(31.13)	106 (100)	2.04	Rejected
B	Digital information retrieval skills	35(33.01)	42(39.62)	24(22.64)	5(4.71)	106 (100)	3.00	Accepted

C	Digital information and data literacy	12(11.32)	10(9.43)	36(33.96)	48(45.28)	106 (100)	1.86	Rejected
D	Digital content creation and management skills	2(1.88)	13(12.26)	42(39.62)	49(46.22)	106 (100)	1.69	Rejected
E	Digital communication skills	33 (31.13)	49(46.22)	13(12.26)	11(10.37)	106 (100)	2.98	Accepted
F	Digital collaboration skills	7(6.60)	13(12.26)	36(33.96)	50(47.16)	106 (100)	1.78	Rejected
G	Digital information security skills e.g. encryption and firewall	15(14.15)	19(17.92)	31(29.24)	41(38.67)	106 (100)	2.07	Rejected
H	Digital mobile technology application skills	37(34.90)	37(34.90)	25(23.58)	7(6.60)	106 (100)	2.98	Accepted
I	Technical operation skills e.g. troubleshooting of systems	9(8.49)	11(10.37)	43(40.56)	43(40.56)	106 (100)	1.86	Rejected
J	Digital ethics and legal awareness e.g. AI ethical use, digital citation and reference data management	49(46.22)	42(39.62)	13(12.26)	2(1.88)	106 (100)	3.41	Accepted
K	Digital pedagogical and instructional skills e.g. teaching with the use of digital technologies	11(10.37)	19(17.92)	32(30.18)	44(41.50)	106 (100)	1.97	Rejected
L	Coding and programming skills	9(8.49)	15(14.15)	43(40.56)	39(36.79)	106 (100)	1.94	Rejected
M	Robotics and AI application skills	5(4.71)	11(10.37)	31(29.24)	59(55.60)	106 (100)	1.64	Rejected

Table 6 reveals a mixed level of digital competencies among librarians. High-level competencies were observed in: digital information retrieval skills (Mean = 3.00), digital communication skills (Mean = 2.98), mobile technology application skills (Mean = 2.98), and digital ethics and legal awareness (Mean = 3.41). However, several critical competencies such as digital curation (2.04), data literacy (1.86), content creation (1.69), collaboration (1.78), programming (1.94), and AI/robotics (1.64) were low. This suggests that librarians are proficient in basic and operational digital skills, but lack competencies in advance, technical, and emerging digital areas, which are essential for innovation.

Table 7: Research Question 3: What is **the extent of digital service innovation** in the selected academic libraries in Ebonyi State? VHE: Very High Extent (4); HE: High Extent (3); LE: Low Extent (2); VLE: Very Low Extent (1).

SN	Extent of digital service innovation	VHE	HE	LE	VLE	Total	Mean	Decision
A	Artificial Intelligence (AI)-powered services e.g. Library chatbots and virtual assistants	2(1.88)	5(4.71)	35(33.01)	64(60.37)	106 (100)	1.48	Rejected
B	Online Public Access Catalogue services	19(17.92)	14(13.20)	36(33.96)	37(34.90)	106 (100)	2.14	Rejected
C	Extended Reality services e.g. Digital tours and exhibition	8(7.5)	13(12.26)	36(33.96)	49(46.22)	106 (100)	1.81	Rejected
D	Self-Service Technologies: RFID systems, smart library kiosks, and apps	10(9.43)	11(10.37)	36(33.96)	49(46.22)	106 (100)	1.83	Rejected
E	Maker space services	8(7.5)	13(12.26)	35(33.01)	50(47.16)	106 (100)	1.80	Rejected
F	Internet of Things and smart library services	15(14.15)	14(13.20)	21(19.81)	56(52.83)	106 (100)	1.83	Rejected

G	Digital references services e.g. Digital Document delivery, digital Current Awareness Services, etc.	13(12.26)	21(19.81)	36(33.96)	36(33.96)	106 (100)	2.10	Rejected
H	Audio-Visual and Multimedia services	8(7.5)	13(12.26)	36(33.96)	49(46.22)	106 (100)	1.81	Rejected
I	Open Educational Resources services	13 (12.26)	12(11.32)	36(33.96)	45(42.45)	106 (100)	1.93	Rejected
J	Social media services	15(14.15)	14(13.20)	21(19.81)	56(52.83)	106 (100)	1.83	Rejected
K	Special events services e.g. e-conferences (videoconferencing), webinar, etc.	10(9.43)	10(9.43)	38(35.84)	48(45.28)	106 (100)	1.83	Rejected
L	Digital literacy services	15(14.15)	19(17.92)	31(29.24)	41(38.67)	106 (100)	2.07	Rejected
M	Research consultancy services	13(12.26)	21(19.81)	36(33.96)	36(33.96)	106 (100)	2.10	Rejected
N	Online Learning services e.g. Massive Open Online Courses (MOOCs) assistance	12(11.32)	10(9.43)	38(35.84)	46(43.39)	106 (100)	1.88	Rejected
O	Electronic publishing services	10(9.43)	12(11.32)	48(45.28)	36(33.96)	106 (100)	1.96	Rejected

Table 7 indicates that digital service innovation is generally low across the libraries under study. All listed services—including AI-powered services (Mean = 1.48), IoT services (1.83), Maker space services (1.80), Digital reference services (2.10), Online learning services (1.88) were rejected. Even commonly expected services such as OPAC services (Mean = 2.14), Social media services (Mean = 1.83) were rated low. This implies that digital service innovation is still at a developmental stage, with limited integration of modern technologies into library services.

Table 8: Research Question 4: What are **the perceived impacts of digital readiness on service innovation** in the selected academic libraries in Ebonyi State? SA: Strongly Agree (4); A; Agree (3); D: Disagree (2); SD: Strongly Disagree (1).

SN	Perceived impacts of digital readiness on service innovation	SA	A	D	SD	Total	Mean	Decision
A	Ease and efficiency of services delivery	33 (31.13)	49(46.22)	13(12.26)	11(10.37)	106 (100)	2.98	Accepted
B	Proper management of human resources	48(45.28)	36(33.96)	12(11.32)	10(9.43)	106 (100)	3.15	Accepted
C	Enhanced time management	33 (31.13)	48(45.28)	12(11.32)	13 (12.26)	106 (100)	2.95	Accepted
D	Improved user satisfaction	57(53.77)	49(46.22)	-	-	106 (100)	3.53	Accepted
E	Improved library reputation and relevance	48(45.28)	33 (31.13)	11(10.37)	14(13.20)	106 (100)	3.08	Accepted
F	Enhanced user access to information resources	35(33.01)	42(39.62)	24(22.64)	5(4.71)	106 (100)	3.00	Accepted

G	Strengthened research and learning support	49(46.22)	57(53.77)	0 (0)	0 (0)	106 (100)	3.46	Accepted
H	Greater institutional visibility	48(45.28)	36(33.96)	12(11.32)	10(9.43)	106 (100)	3.15	Accepted
I	Enhanced information resources security	33 (31.13)	49(46.22)	13(12.26)	11(10.37)	106 (100)	2.98	Accepted
J	Improved job satisfaction	37(34.90)	39(36.69)	13 (12.26)	17(16.03)	106 (100)	2.90	Accepted

Table 8 indicates that despite low infrastructure and innovation levels, respondents strongly agreed that digital readiness has significant positive impacts. All items were accepted, including improved user satisfaction (Mean = 3.53), strengthened research support (3.46), human resource management (3.15), institutional visibility (3.15), access to information (3.00). This indicates a strong awareness among librarians of the transformative potential of digital readiness, even though it is not yet fully realized in their various libraries.

Table 9: Research Question 5: What are the **challenges hindering digital readiness and service innovation** in the selected academic libraries in Ebonyi State? SA: Strongly Agree (4); A; Agree (3); D: Disagree (2); SD: Strongly Disagree (1).

SN	**Challenges hindering digital readiness and service innovation**	**SA**	**A**	**D**	**SD**	**Total**	**Mean**	**Decision**
A	Inadequate management support	33 (31.13)	49(46.22)	13(12.26)	11(10.37)	106 100%	2.98	Accepted
B	Paucity of funds	35(33.01)	42(39.62)	24(22.64)	5(4.71)	106 100%	3.00	Accepted
C	Absence of strategic institutional policy on digital technologies	43(40.56)	49(46.22)	5(4.71)	9(8.49)	106 100%	3.18	Accepted
D	Technophobia among staff members	52 (49.05)	33 (31.13)	13 (12.26)	8 (7.54)	106 100	3.21	Accepted
E	Resistance to change	8(7.5)	13(12.26)	36(33.96)	49(46.22)	106 100%	1.81	Rejected
F	Poor technological infrastructure	44(41.50)	39(36.79)	10(9.43)	13(12.26)	106 (100)	3.07	Accepted
G	Poor space allocation	35(33.01)	42(39.62)	24(22.64)	5(4.71)	106 (100)	3.00	Accepted
H	Inadequate opportunities for digital literacy skills acquisition	48(45.28)	36(33.96)	12(11.32)	10(9.43)	106 (100)	3.15	Accepted

From the results on *Table 9*, the study identified several challenges such as technophobia among staff (Mean = 3.21), lack of institutional policy (3.18), inadequate digital skills opportunities (3.15), poor infrastructure (3.07), paucity of funds (3.00), and poor space allocation (3.00). Interestingly, resistance to change (Mean = 1.81) was rejected, suggesting that librarians are willing to embrace change.

Discussion of Findings

The findings of this study reveal important insights into the state of digital readiness and service innovation in selected academic libraries in Ebonyi State. The demographic distribution shows that the majority of respondents were drawn from major institutions, Alex Ekwueme Federal University Library, Akanu Ibiam Federal Polytechnic Library, Unwana, Ebonyi State College of Education, Ebonyi State University and Evangel University Libraries. This suggests that the data largely reflect the realities most academic libraries, in Ebonyi State. Additionally, most respondents were from the Readers' Services division, indicating that the findings are strongly grounded in the perspectives of librarians who are directly involved in user service delivery. This strengthens the reliability of responses related to digital service innovation.

The results further indicate that the workforce in the selected libraries is largely composed of first-degree holders (HND/BSc/BLIS), with fewer respondents possessing postgraduate qualifications. This distribution has implications for digital transformation, as higher-level academic and professional training is often associated with advanced digital competencies, research capacity, and innovation adoption. The limited number of highly qualified personnel may partly explain the low level of digital innovation observed in the study.

With respect to the availability and adequacy of digital infrastructure, the findings show that most modern and emerging technologies are available at a low extent. Technologies such as digital institutional repositories, library management systems, RFID, blockchain, Internet of Things, and extended reality were all rated below the acceptable benchmark. This suggests that the libraries are yet to fully embrace the technological advancements required for modern information service delivery. This is consistent with the findings of Idhalama, Oredo, and Makori (2025) who reported that there is a significant evidence of digital infrastructural deficit prevalence among university libraries in Nigeria. While the basic technological environment exists, it has not been sufficiently expanded to support advanced digital services.

In terms of digital competencies, the study reveals a mixed outcome. Librarians demonstrated relatively high competence in fundamental digital skills such as information retrieval, communication, mobile technology use, and digital ethics. These are essential operational skills that support everyday library functions. However, competencies in more advanced and innovative areas, such as digital content creation, data literacy, programming, artificial intelligence, and robotics were found to be low. This indicates a significant skills gap that may hinder the ability of librarians to design and implement innovative digital services. The findings suggest that while librarians can effectively use existing systems, they may lack the expertise required to drive digital transformation. This conforms to the findings of Oladokun, Ogunjimi, Oyetola, Orubebe, and Enakrire (2025) who revealed a moderate level of awareness of digital technologies among librarians, but also found inadequate knowledge of strategies for navigating these technological disruptions among librarians, and a lack of preparedness to adopt innovative practices.

The extent of digital service innovation in the libraries was found to be generally low. All identified digital services, including AI-powered services, IoT-based services, maker spaces, digital reference services, and online learning support were rated below the acceptable level. Even widely expected services such as online public access catalogues and social media services did not meet the benchmark. This finding reflects a limited integration of digital technologies into service delivery and suggests that the libraries are still operating largely within traditional service models. The low level of innovation may be directly linked to inadequate infrastructure and insufficient digital competencies among staff. For instance, Okoro and Musa (2025) and Hamad, Al-Fadel, M, and Shehata (2024) had revealed that digital literacy skills/ competencies had a positive significant impact on innovative and smart information service delivery.

Interestingly, despite the low level of infrastructure and innovation, respondents strongly agreed on the positive impacts of digital readiness. The study found high agreement that digital readiness enhances service efficiency, improves user satisfaction, strengthens research support, and increases institutional visibility. This indicates a high level of awareness among librarians regarding the benefits of digital transformation. The implication is that the challenge is not a lack of understanding of the importance of digital readiness, but rather the inability to translate this awareness into practice due to existing constraints. The findings buttress the studies of Omeluzor, Ugochi, and Izuakolam (2020), Baidoo and Nwagwu (2024), and Potiskum and Abdullahi (2025) who asserted that the availability and adoption of technological tools in libraries can promote innovation in services delivery, *significantly enhance the utilization of information resources and promote* users' satisfaction.

The study also identified several critical challenges hindering digital readiness and service innovation such as technophobia, lack of institutional policies on digital technologies, inadequate funding, poor technological infrastructure, insufficient training opportunities, and poor space allocation. These challenges highlight systemic and structural issues rather than individual resistance to change, suggesting that librarians are generally willing to adopt new technologies if enabling conditions are provided. This finding underscores the need for institutional support, strategic planning, and investment in digital capacity building. This is in tandem with the findings of Atchrimi and Ogunbodede (2024), who reported inconsistent power supply, poor ICT facilities, and lack of ICT training opportunities among others as some of the challenges faced by librarians in acquiring digital skills, as against the findings of Etebu and Zacchaeus (2020) who revealed that alongside inadequate funding, inadequacy of specific skills, inadequate deployment of ICT

infrastructure, resistance to change is a major factor. The case may be different in the selected academic libraries in Ebonyi due to the presence of several emerging librarians much familiar with the digital information landscape.

In summary, the findings reveal serious implications for the future of librarianship in Nigeria as the current state of digital readiness could lead to professional obsolescence, reduced library patronage, persistent digital divide, declining relevance of libraries, and low research productivity. This implies that the relevance of academic libraries is being threatened by an increasingly digital information landscape unless strategic proactive actions are executed. This is corroborated by **Owolabi, Yemi-Peters, Oyetola, Bello and Oladokun (2022) who revealed that the readiness of university libraries in Nigeria towards the adoption of robotics technology is not encouraging, and Odunlade and Ojo (2023) who iterated that** digital transformation is yet to be fully embraced in Nigerian university libraries, as there is no significant change in the use of digital technologies in the deployment of library services in Nigerian academic libraries, and that digital transformation may yet remain an illusion even when the global narrative is already tending towards 5th industrial revolution.

Conclusion

Librarianship in Nigeria and all over the world is experiencing a highly competitive information environment marked by an exponential increase in the digital technologies that continue to reshape the information landscape. To contextualize this situation to the Nigerian Library and Information Service community, this study examined **digital readiness and service innovation in selected academic libraries in Ebonyi State, with the objective of establishing the implications for the future of librarianship in Nigeria. The findings indicate that** *b*asic digital infrastructure exists, but advanced technologies are lacking. The study indicates that the librarians possess foundational digital skills, but lack advanced competencies. Also, the study reveals that digital service innovation is minimal. Although, the awareness of the benefits of digital readiness on service innovation is high, the level of implementation is low. Systemic challenges such as institutional, financial, and capacity-related barriers hinder progress in service innovation in the libraries. The situation poses serious risks to the future of librarianship in Nigeria as it threatens the professional relevance of librarians, research productivity, library patronage, and expands persistent digital divide and inequality. It also limits access to global opportunities, service delivery and general redundancy in service delivery.

The study reveals that academic libraries risk becoming marginalized in an increasingly digital information environment unless proactive measures are implemented to address the anomalies. The study points at a clear disconnect between awareness and implementation. While librarians recognize the importance and benefits of digital readiness, the lack of adequate digital infrastructure, skills, and institutional support continues to limit the extent of digital service innovation. Addressing these gaps is essential for ensuring the sustainability and relevance of academic libraries in the digital age, and the protection and security of the future librarianship as a competitive information profession in Nigeria.

Recommendations

Against the backdrop of the findings of the study, the following recommendations are proposed:

I. Continuous capacity building for librarians to ensure that librarians are technically prepared and equipped for the challenges of innovative digital services delivery.
II. Increased investment in digital infrastructure in order to enhance the provision of advanced digital technologies for the delivery of innovative library services to users.
III. Promotion of an institutional culture that supports innovation and technological advancement through strategic policy design and implementation on the adoption of digital technologies in critical institutional sectors such as academic libraries in other to enhance the potentials of innovativeness in service delivery in academic libraries towards meeting the goals of the academic libraries, and by extension, their parent institutions.
IV. Alocation of adequate space for innovative library services delivery in academic libraries should be encouraged in order to maximise the potentials of the digital competencies acquired by academic librarians for innovative services delivery.

Abstract

The emergence of electronic resources has transformed academic library services globally and has significantly reshaped access to information for teaching, learning, research, and scholarly communication. In university environments, electronic resources such as electronic journals, electronic books, online databases, institutional repositories, and other digital information systems have become indispensable tools for supporting academic activities. This study investigates users' perception and utilization of electronic resources for academic activities in Federal university libraries in North-East, Nigeria. Specifically, the study examines users' perceptions toward electronic resources, the extent to which these resources are utilized for academic purposes, challenges affecting effective use, and strategies for improving utilization. The study adopts a descriptive survey research design. The population consists of undergraduate students, postgraduate students and academic staff in selected federal universities in North-East, Nigeria. Stratified random sampling technique was used for selecting respondents, while data were collected through a structured questionnaire and analyzed using descriptive and inferential statistics. Findings indicate that users generally possess positive perceptions toward electronic resources and utilize them considerably for research, assignments, teaching preparation, literature review and current awareness services. However, infrastructural deficiencies such as unstable electricity supply, poor internet connectivity, inadequate information literacy skills and low awareness continue to constrain optimum electronic resources utilization. The study concludes that although electronic resources have become integral to academic activities, improved infrastructure, user education, increased funding, and sustainable digital resource management are essential for maximizing their benefits. The study recommends strengthening electronic resource services in federal university libraries through improved policy implementation, ICT support and regular training programs.

Keywords: Academic Activities, Electronic Resources, University Libraries, Users' Perception, Utilization

Introduction

Academic libraries have historically served as the intellectual hub of universities through the acquisition, organization and dissemination of knowledge resources. Traditionally, these functions relied heavily on print collections including books, journals, indexes and reference materials. However, developments in information and communication technologies have altered the information landscape, transforming academic libraries from predominantly print-based institutions into hybrid and digital information centers (Aina, 2021; Creswell & Creswell, 2023). This transition has led to the emergence and rapid growth of electronic resources as critical components of academic library collections.

Electronic resources have become central to modern scholarship because they provide timely, current and remote access to scholarly information. They include electronic journals, electronic books, online databases, institutional repositories, digital archives, open educational resources and internet-based information systems. Unlike print resources, electronic resources allow simultaneous access by multiple users, offer sophisticated search capabilities, support remote learning and enable users to retrieve current scholarly information regardless of geographical barriers (Nwachukwu, 2020; Ezeani, 2023)

In higher education institutions, electronic resources support diverse academic activities, including teaching, learning, assignment preparation, research, thesis writing, publication and professional development. Their role has become increasingly significant with the growth of digital scholarship, blended learning and online education. Students and faculty members depend on electronic resources not only for obtaining current literature but also for accessing multidisciplinary research outputs, citation databases, indexing services and scholarly communication platforms.

In Nigeria, university libraries have increasingly embraced electronic resources through subscriptions to databases such as JSTOR, ScienceDirect, EBSCOhost, AGORA, HINARI and institutional repositories. This development reflects broader efforts to modernize library services and align academic libraries with global digital information practices. Nevertheless, despite investments in electronic resources, evidence suggests that utilization in many Nigerian universities remains inconsistent and sometimes below expectations (Issa, Sadiku, & Kpakiko, 2021; Igbinovia, 2024). While resources may be available, several factors influence whether users perceive them positively and use them effectively.

Federal university libraries in North-East Nigeria operate in a context shaped by infrastructural limitations, funding constraints and varying levels of ICT development. Given these realities, investigating users' perception and utilization of electronic resources in these institutions becomes necessary for improving library service delivery and enhancing academic productivity. This study therefore examines electronic resources and academic activities in federal university libraries of North-East, Nigeria with emphasis on users' perception and utilization.

Statement of the Problem

University libraries in Nigeria have made considerable investments in electronic resources to support teaching, learning and research. These investments are intended to improve access to scholarly information, enhance academic productivity and strengthen the quality of university education. Despite these efforts, observations indicate that many subscribed electronic resources remain underutilized by users. In several instances, users depend more on general internet search engines and freely accessible online materials than on specialized scholarly databases subscribed to by their libraries.

This situation raises concerns about the extent to which investments in electronic resources are achieving their intended goals. If users do not fully utilize available electronic resources, the academic benefits expected from such investments may not be realized. Previous studies have attributed underutilization to factors such as poor internet connectivity, unstable electricity supply, inadequate awareness of available resources, low digital literacy skills, authentication challenges and insufficient user training (Yusuf, 2022; Idhalama, Oredo, & Makori, 2025)

In the context of federal university libraries in North-East Nigeria, these challenges may be more pronounced due to regional infrastructural limitations and resource constraints. Yet empirical evidence specifically examining users' perception and utilization of electronic resources in these institutions remains limited. This gap necessitates investigation into how users perceive electronic resources, the extent to which they utilize them for academic activities, the challenges affecting utilization and strategies for improvement.

Objectives of the Study

The broad objective of this study is to investigate users' perception and utilization of electronic resources for academic activities in Federal university libraries in North-East, Nigeria. Specifically, the study seeks to:

1. examine users' perception of electronic resources in federal university libraries in North-East, Nigeria.
2. determine the extent of utilization of electronic resources for academic activities.
3. identify academic activities supported through electronic resources.
4. investigate challenges affecting effective utilization of electronic resources.
5. suggest strategies for improving users' access to and utilization of electronic resources.

Research Questions

The study is guided by the following research questions:

1. What are users' perceptions of electronic resources in federal university libraries in North-East Nigeria?
2. To what extent are electronic resources utilized for academic activities Federal University Libraries in North-East Nigeria?
3. What academic activities are supported through electronic resources?
4. What challenges affect effective utilization of electronic resources?
5. What strategies can improve users' access to and utilization of electronic resources?

Research Hypotheses

The study tests the following null hypotheses:

H01: There is no significant relationship between users' perception and utilization of electronic resources in federal university libraries in North-East Nigeria.

H02: There is no significant difference in the utilization of electronic resources among undergraduate students, postgraduate students and academic staff.

H03: Infrastructure-related challenges have no significant effect on electronic resource utilization.

Literature Review

Concept of Electronic Resources

Electronic resources are information materials stored, accessed and disseminated through electronic means. They include e-journals, e-books, bibliographic databases, full-text databases, online reference sources, digital repositories and web-based scholarly information sources. Their emergence has transformed information provision in academic libraries by improving access, convenience and efficiency. Scholars have noted that electronic resources differ from traditional print materials in several important ways. They permit simultaneous access by multiple users, provide powerful search and retrieval features, support remote accessibility and often offer current information more rapidly than print collections. Their value in supporting research and scholarly communication has made them indispensable in academic libraries (Aina, 2021; Okorie, 2022)

Electronic resources have become particularly important in the contemporary knowledge environment where research productivity depends heavily on access to current and credible information. For university libraries, the integration of electronic resources reflects a shift toward user-centered digital information services capable of meeting the evolving needs of scholars.

Users' Perception of Electronic Resources

Perception refers to the way users understand, interpret and evaluate electronic resources in terms of usefulness, accessibility, reliability and relevance. Users' perceptions often influence acceptance and usage behavior. Where users perceive electronic resources as beneficial and easy to use, they are more likely to adopt and utilize them effectively. Studies have generally shown positive perceptions among university users toward electronic resources (Salah, Bello, & Gwarzo, 2024)

Many users recognize their convenience, speed and usefulness for research and academic tasks. However, perceptions may also be affected by challenges such as complex interfaces, access restrictions, unreliable internet connectivity and inadequate user skills. These factors can influence whether users consider electronic resources easy to use and worthwhile (Alabi, 2021; Ajisebutu et al., 2024).

The Technology Acceptance Model provides useful insight into the relationship between perception and use by emphasizing perceived usefulness and perceived ease of use as key determinants of technology adoption. This framework is relevant to understanding users' interaction with electronic resources (Davis, 1989, as applied in Ezeani, 2023)

Utilization of Electronic Resources for Academic Activities

Utilization refers to the extent to which users access and employ electronic resources in carrying out academic tasks. In university environments, electronic resources support numerous academic activities, including literature searches, assignment preparation, teaching preparation, project writing, data analysis, current awareness and scholarly publishing.

Many studies have reported increasing use of electronic resources for research-related activities, particularly among postgraduate students and faculty. Students frequently use e-journals and databases for assignments and project work, while academic staff use them for teaching materials, publication and research (Yusuf, 2022; Achugbue et al., 2023)

Nevertheless, frequency and depth of utilization often vary depending on awareness levels, digital skills, discipline, resource availability and institutional support. Effective utilization therefore depends not merely on access but also on users' competencies and the enabling environment.

Challenges Affecting Utilization

Despite their importance, electronic resources face numerous challenges affecting utilization, especially in developing countries. One major challenge is poor internet connectivity, which limits access speed and frustrates users. Another is unstable electricity supply, which disrupts access to digital services (Nwachukwu, 2020; Atanda et al., 2025)

Low awareness of available resources also affects utilization. In some cases, users may not know which databases are available or how to access them. Inadequate information literacy skills can further hinder effective searching and retrieval. Other challenges include authentication barriers, insufficient ICT facilities, limited funding and inadequate technical support. These challenges suggest that improving utilization requires attention not only to resource acquisition but also to infrastructure, training and user support services.

Theoretical Framework

This study is anchored on the Technology Acceptance Model (Davis, 1989, as applied in Ezeani, 2023). The model posits that users' acceptance and use of technology are influenced primarily by perceived usefulness and perceived ease of use. Perceived usefulness refers to the degree to which users believe a technology will improve performance, while perceived ease of use refers to the extent to which they consider it free from difficulty.

Applied to this study, users are likely to utilize electronic resources when they perceive them as useful for supporting academic activities and easy to access and navigate. The model therefore provides a suitable framework for understanding the relationship between users' perceptions and utilization behavior.

Methodology

The study adopted a descriptive survey research design because it enables the collection of data from a representative sample to describe users' perceptions, utilization patterns, and challenges associated with the use of electronic resources. The population comprised undergraduate students, postgraduate students, and academic staff from selected federal universities in North-East Nigeria, namely: University of Maiduguri, Federal University Kashere, Federal University Gashua, Federal University Wukari, and Modibbo Adama University. A sample size of 400 respondents was drawn from the population using the Taro Yamane formula. Stratified random sampling was employed to ensure adequate representation across the various user categories, while simple random sampling was used to select individual respondents. Data were collected using a structured questionnaire titled "Users' Perception and Utilization of Electronic Resources Questionnaire (UPUERQ)." The instrument consisted of sections covering demographic information, users' perceptions of electronic resources, the extent of utilization, challenges affecting utilization, and strategies for improving access and use.

The questionnaire employed a five-point Likert scale to measure users' perceptions and challenges associated with electronic resource utilization, while utilization frequency was assessed using categories such as daily, weekly, monthly, and rarely. The instrument was subjected to face and content validation by experts in Library and Information Science

as well as Measurement and Evaluation. Reliability was established through a pilot study using the Cronbach Alpha reliability coefficient. Data were analyzed using frequency counts, percentages, mean scores, and standard deviations to answer the research questions. Furthermore, Chi-square, Analysis of Variance (ANOVA), and regression analysis were used to test the hypotheses at the 0.05 level of significance.

Findings

Table 1. Users' Perceptions of Electronic Resources

Statements	Mean	Std. Dev.	Decision
Electronic resources are useful for research	4.32	0.72	Accepted
Electronic resources improve academic performance	4.21	0.81	Accepted
Electronic resources are easy to access	3.68	0.89	Accepted
Electronic resources are reliable sources of information	4.15	0.76	Accepted
I prefer electronic resources to print resources	3.84	0.92	Accepted
Grand Mean	4.04		Accepted

Table 1 revealed a grand mean score of 4.04, which is higher than the criterion mean of 3.00. This indicates that respondents generally possess positive perceptions of electronic resources. The finding suggests that users recognize the usefulness, reliability, and academic value of electronic resources.

Table 2. Extent of Utilization of Electronic Resources for Academic Activities

Academic Activities	High Extent (%)	Moderate Extent (%)	Low Extent (%)
Research	72	22	6
Assignment Preparation	76	18	6
Teaching Preparation	68	24	8
Literature Review	71	20	9
Current Awareness	65	27	8

Table 2 indicated a high level of utilization of electronic resources for research, assignment preparation, and literature review activities. Assignment preparation recorded the highest utilization rate (76%), suggesting that users rely heavily on electronic resources to accomplish academic tasks.

Table 3. Electronic Resources Commonly Utilized by Respondents

Electronic Resources	Frequently Used (%)	Occasionally Used (%)	Rarely Used (%)
E-journals	74	19	7
E-books	61	28	11
Online Databases	69	22	9
Institutional Repositories	57	30	13
Internet Scholarly Sources	82	14	4

Table 3 revealed that Internet scholarly sources (82%) and e-journals (74%) were the most frequently utilized electronic resources among respondents. This finding implies that users depend extensively on online scholarly information sources to access current and relevant academic materials.

Table 4. Challenges Affecting Utilization of Electronic Resources

Challenges	Mean	Decision
Poor Internet Connectivity	4.55	Accepted
Unstable Electricity Supply	4.49	Accepted

Inadequate Awareness	4.20	Accepted
Limited User Training	4.11	Accepted
Authentication Problems	3.96	Accepted
Grand Mean	4.26	Accepted

Table 4 showed that poor Internet connectivity (Mean = 4.55) and unstable electricity supply (Mean = 4.49) were the most significant challenges affecting the utilization of electronic resources. Since all identified challenges recorded mean scores above the benchmark mean of 3.00, they were considered significant barriers.

Table 5. Strategies for Improving Utilization of Electronic Resources

Strategies	Mean	Decision
Improve Internet Facilities	4.61	Accepted
User Education Programmes	4.52	Accepted
Increase Funding for Databases	4.46	Accepted
Improve Remote Access Systems	4.28	Accepted
Alternative Power Supply	4.39	Accepted

Table 5 indicated that respondents strongly agreed that improving Internet facilities, implementing user education programmes, increasing funding for electronic databases, improving remote access systems, and providing alternative power supplies are critical strategies for enhancing the utilization of electronic resources.

Test of Hypotheses

Table 6: Chi-Square Analysis of Relationship Between Users' Perception and Utilization

Variables	X^2 Calculated	X^2 Critical	df	Decision
Perception and Utilization	34.56	9.49	4	Reject H01

The tested hypothesis revealed that since the calculated chi-square value of 34.56 is greater than the critical value of 9.49, the null hypothesis is rejected. This indicates a significant relationship between users' perception and utilization of electronic resources.

Table 7: ANOVA Showing Difference in Utilization Among User Categories

Source of Variation	Sum of Squares	df	Mean Square	F	Sig
Between Groups	26.41	2	13.21	5.62	.004
Within Groups	932.17	397	2.35		
Total	958.58	399			

Table 7 shows that since p = .004 is less than .05, a significant difference exists in utilization among undergraduate students, postgraduate students and academic staff. Thus, the null hypothesis is rejected.

These findings support the assumptions of the Technology Acceptance Model and align with previous studies indicating that both user attitudes and infrastructural conditions shape utilization patterns.

Discussion of Findings

The findings revealed that users generally possess positive perceptions toward electronic resources and utilize them substantially for research, assignments and teaching-related activities. However, infrastructural barriers significantly affect effective utilization. The hypotheses tested also established significant relationships among perception, user categories and utilization patterns.

Findings reveal that users generally hold positive perceptions toward electronic resources, corroborating with earlier studies (Alabi, 2021; Ajisebutu et al., 2024). Respondents agreed that electronic resources are useful for research, improve academic performance, support learning and provide reliable information. Positive perceptions suggest substantial acceptance of electronic resources among users.

The study also found considerable utilization of electronic resources for academic activities, consistent with previous findings (Yusuf, 2022; Abdulrazaq et al., 2026). Respondents frequently used electronic resources for assignments, literature review, research projects, teaching preparation and current awareness. Research and assignment preparation emerged as major activities supported by electronic resources.

However, utilization patterns varied among user groups, with postgraduate students and academic staff demonstrating relatively higher use than undergraduates. This difference may be associated with varying information needs, research intensity and digital competencies.

Regarding challenges, findings showed that poor internet connectivity and unstable electricity supply were major constraints affecting use, supporting related studies (Nwachukwu, 2020; Idhalama et al., 2025). Inadequate awareness of available databases, limited user training and authentication difficulties also emerged as significant barriers.

Hypothesis testing showed a significant relationship between users' perception and utilization of electronic resources, indicating that positive perceptions contribute to higher use. Infrastructure-related challenges were also found to significantly affect utilization.

Conclusion

Electronic resources have become indispensable components of academic library services and play significant roles in supporting academic activities in federal university libraries. This study has shown that users generally perceive electronic resources positively and utilize them substantially for research, assignments and teaching-related activities. However, utilization is constrained by infrastructural deficiencies, limited awareness and inadequate training. These challenges affect the extent to which users can maximize available electronic resources. The study concludes that improving electronic resource utilization requires not only acquisition of digital resources but also investments in infrastructure, user education and supportive institutional policies.

Recommendations

Based on the findings, the study recommends that:

- University management and library administrators should improve internet bandwidth and ICT infrastructure to support efficient access to electronic resources.
- Regular user education and information literacy programs should be organized by the library administrators to improve awareness and search competencies among users.
- Government and university authorities should increase funding for subscriptions to relevant electronic databases and maintenance of digital library services.
- Libraries should strengthen remote access systems and authentication mechanisms to facilitate seamless off-campus access.
- Alternative power solutions such as solar and backup systems should be provided by the university management to address unstable electricity supply.
- Libraries administrators should conduct regular orientation and database training workshops for students and academic staff. Continuous assessment of users' needs and utilization patterns should be carried out for improvement of electronic resource services.

Abstract

This study investigated lecturers' perceptions and usability of emerging technologies (ETs) in the research process. ETs such as artificial intelligence (AI), machine learning, big data analytics, and digital collaboration tools have increasingly transformed academic research by improving efficiency, accuracy, and innovation. Despite these benefits, their adoption and use among lecturers remains inconsistent. The study adopted a descriptive survey research design, and data were collected from 175 lecturers from Five selected faculties in Federal University Oye-Ekiti, using a structured questionnaire as research instrument. Data were analyzed using descriptive statistics such as frequency counts, percentages, means, and standard deviation. Findings revealed that lecturers generally hold a positive perception of ETs (grand mean = 3.31), acknowledging their relevance in improving research quality, efficiency, and collaboration. However, the extent of use was moderate (grand mean = 2.95), indicating a gap between perception and actual usage. The study further found that key enablers of adoption include perceived usefulness, ease of use, access to digital resources, internet availability, and institutional support (grand mean = 3.24). Conversely, major challenges hindering adoption include high cost of technology, inadequate training opportunities, limited access to tools, lack of institutional support, and insufficient digital skills (grand mean = 2.99). The study concludes that although lecturers are positively disposed toward ETs, their full integration into research practices is constrained by institutional, technological, and individual barriers. It recommends improved infrastructure, continuous training, adequate funding, and supportive institutional policies to enhance effective adoption and use of ETs in academic research.

Keywords: Emerging Technologies (ETs), Perception, Usability, Lecturers, Research Process, Technology Adoption.

Introduction

The landscape of academic research is undergoing a profound transformation as emerging technologies (ETs) increasingly shape how scholars generate, analyse, and disseminate knowledge. Arviansyah, Azis, Sondari and Harsanto (2024) revealed that digital technologies have significantly transformed research processes by enhancing access to information, improving data analysis capabilities, and facilitating collaboration among scholars. ETs have enhanced personalization, and research productivity in higher education, helping researchers improve efficiency and depth (Matos, et al., 2025). The adoption of ETs across all stages of the research process ranging from literature searching and data collection to analysis, visualization, and dissemination of results has become increasingly prevalent in contemporary research practice. Onyema et al. (2024) stated that ETs provide easy access to vast amounts of information and

educational resources that support employment chances of academic professionals. ETs such as artificial intelligence (AI), machine learning, learning analytics, and extended reality (XR) are reshaping how academic research is conceptualized and executed, offering opportunities for enhanced efficiency, accuracy, and creativity in scholarly work. Chen, Lin and Li (2025) found that ETs such as AI, VR/AR, and big data are profoundly reshaping research and educational systems by enabling new models of innovation, interdisciplinary integration, and knowledge creation. Similarly, Isiaka et al. (2025) stated that AI tools have emerged as powerful enablers of research processes as AI applications are now widely used in literature searching, data mining, statistical analysis, plagiarism detection, academic writing assistance, and even peer review processes.

Emerging technologies are becoming central not just in pedagogical practices but also in research workflows, enabling lecturers and researchers to re-imagine traditional methods and embrace digital innovations that enhance research quality and impact. Onyema et al. (2024) stated that ETs provide easy and instant access to vast amounts of information and resources and researchers can explore a wide range of online materials, research papers, e-books, and educational videos to enhance their knowledge and skills. AI tools using natural language processing (NLP) and machine learning can automate literature search, screening, and data extraction, significantly reducing workload in systematic reviews (Bolaños, Salatino, Osborne and Motta, 2024). Furthermore, learning analytics and extended reality tools are not only enhancing teaching and learning environments but also providing researchers with real-time insights into data, user behavior, and system performance, thereby expanding methodological capabilities in empirical research contexts. Riordan et al. (2023) stated that learning analytics combined with AI provides scalable insights into learner and researcher behaviours, enabling data-driven decision making and personalisation. This technological integration promises important benefits in accelerating research processes, improving methodological rigor, and supporting evidence-based decision making in scholarly workflows.

Despite the potential for ETs to enrich research practices, the actual adoption and utilization of these tools by university lecturers vary widely. Empirical studies show that even when lecturers are aware of and have positive attitudes toward ETs such as artificial intelligence, the frequency and depth of actual usage remain low in many contexts. For example, Sheu (2025) found that lecturers perceive AI as beneficial for enhancing research design and methodological quality, but utilization of AI tools in research and assessment practices was low, with recommendations that institutions take active steps to promote effective implementation of AI. Furthermore, research from Nigerian higher education institutions indicates that access to reliable internet connectivity, institutional subscriptions to digital databases, training opportunities, and supportive policies significantly shapes lecturers' perceptions and willingness to use ETs for research (Uzorka et al., 2023). Ibrahim et al. (2025) indicated that users' perceptions of usefulness, ease of use, and trust significantly shape behavioural intention and actual use behaviour, confirming the mediating role of perception in adoption processes. However, lecturers' perceptions and usability of ETs are multidimensional and context-dependent, shaped by a combination of personal beliefs, institutional conditions, and ethical considerations rather than by technological availability alone.

Lecturers' perceptions and usability of ETs entail their attitudes, beliefs, and experiences regarding the usefulness, ease of use, accessibility, and effectiveness of these technologies in supporting various stages of the research process. Moreover, broader research on educational technology adoption underscores that perception plays a pivotal role in shaping technology use. Theoretical frameworks such as the Technology Acceptance Model (TAM) show that perceived usefulness and ease of use significantly influence lecturers' behavioural intentions to employ new technologies, including those relevant for research activities. Uzorka et al. (2023) suggests that lecturers and academic staff often face challenges related to digital literacy, access to infrastructure, professional development, and institutional support, which can influence their perceptions and actual use of emerging technology tools in research activities. Understanding lecturers' perception and usability of ETs in research is therefore critical for identifying gaps in adoption and use ethically. Given this landscape, examining how lecturers perceive and use ETs in the research process provides valuable insights into the enablers and barriers at both personal and institutional levels. This research contributes to that effort by examining how lecturers perceive and use emerging research technologies, identify factors influencing lecturers' adoption and use of emerging research technologies, and the implications for enhancing research productivity and academic excellence.

Research Questions

The following research questions are tailored for this study:

1. What are the lecturers' perceptions of ETs and their relevance to the research process?
2. What is the extent to which lecturers use ETs in various stages of research process?
3. What are the enablers of lecturers' adoption and use of ETs for research process? and
4. What are the challenges lecturers face in adopting ETs for research process?

Literature Review

In the context of research, emerging technologies (ETs) refer to innovative digital tools and systems that enhance research productivity, efficiency, and quality. These include artificial intelligence (AI), machine learning, big data analytics, extended reality (XR), cloud computing, and digital collaboration platforms. It is innovative and evolving

digital tools and systems that enhance and transform research processes by improving efficiency, analytical capacity, collaboration, and the dissemination of scholarly knowledge. According to Sembey, Hoda and Grundy (2024), ETs such as artificial intelligence (AI), learning analytics, and extended reality (XR) are rapidly gaining attention in higher education due to their transformative potential for teaching, learning, and research practices, even though many are still in early stages of adoption. Similarly, Qian (2025) refers to ETs has technologies that are in a rapid growth phase, significantly transforming teaching, learning, and scholarly activities while still undergoing refinement and integration into mainstream practice. Also, Veletsianos and Kimmons (2012) stated that ETs in higher education are characterized by their potential to disrupt traditional academic practices and introduce new ways of conducting research and knowledge production. Onyema et al. (2024) stated that ETs have revolutionized the research and publication process and that online databases, digital libraries, and academic search engines enable researchers to access a vast array of scholarly articles and publications.

Emerging technologies encompass a wide range of digital innovations including artificial intelligence (AI), machine learning, big data analytics, extended reality (XR), and learning analytics that are increasingly integrated into various higher education functions. Sembey, Hoda and Grundy (2024) stated that technologies have been used in higher education for many years and the use of ETs in education such as artificial intelligence, extended reality technologies such as virtual reality has proliferated in recent times. In academic research, ETs are increasingly acknowledged for their capacity to transform traditional research processes, including literature searching and discovery, data collection, analysis, and the dissemination of research outputs. Veletsianos and Kimmons (2012) stated that ETs have transformed traditional research practices by automating routine tasks, enabling advanced data analysis, and supporting collaborative research across geographic boundaries. Similarly, Bond et al. (2024) emphasized that ETs and AI technologies enhance research and academic performance by supporting data-driven decision-making, automation of tasks, and improved efficiency, particularly when aligned with user needs and institutional contexts. A comprehensive review shows that AI (especially NLP and machine learning) is widely used to automate searching, screening, data extraction, and synthesis, thereby reducing manual workload and improving efficiency and consistency in systematic reviews (Ofori-Boateng, Aceves-Martins, Wiratunga, Moreno-Garcia, 2024).

Notwithstanding the advantages that ETs provide for academic research practices and processes, lecturers' perceptions play a crucial role in determining the extent to which these technologies are adopted. Perception in this study refers to lecturers' subjective beliefs, attitudes, and evaluations regarding the usefulness, ease of use, and value of ETs in supporting research practices and processes. Positive perceptions, such as recognition of efficiency gains, and improved research quality increase lecturers' willingness to adopt these tools. According to Davis (1989), perceived usefulness and perceived ease of use are key determinants of individuals' acceptance of new technologies, directly influencing their intention to use them in the Technology Acceptance Model (TAM). Ibrahim et al. (2025) revealed that perceived usefulness remains the strongest predictor of intention to use emerging technologies, confirming that perception drives both adoption and effective utilization. Also, Venkatesh et al. (2003) emphasized that performance expectancy and facilitating conditions strongly shape users' adoption behaviour through the Unified Theory of Acceptance and Use of Technology (UTAUT). Granić (2022) stated that lecturers' confidence in their own digital competence has been identified as a key determinant of perception and adoption of technology and that lecturers with higher levels of digital literacy are more open to using AI-driven analytics and digital research platforms than those with limited exposure or training. Zawacki-Richter et al. (2019) argued that academics are more inclined to adopt ETs such as artificial intelligence when they perceive clear benefits for research efficiency, quality, and innovation, reinforcing the central role of perception in technology adoption decisions.

Usability on the hand, refers to the extent to which a system, tool, or technology can be employed by its intended users in a manner that is effective, efficient, and satisfying, enabling them to accomplish specific tasks or goals with minimal difficulty or frustration. According to Nielsen (2012), usability is a quality attribute that assesses how easy user interfaces are to use, encompassing learnability, efficiency, memorability, error frequency, and user satisfaction. For this study, usability refers to lecturers' ability to effectively, efficiently, and satisfactorily use ETs to perform research-related tasks, including literature searching, data collection, analysis, and dissemination of findings. International Organization for Standardization (ISO 9241-11) (2018) described usability as the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use. ETs may offer transformative capabilities but their actual impact on adoption for research depends heavily on usability. Zawacki-Richter et al. (2019) argued that academics are more likely to adopt ETs when they are user-friendly, reduce cognitive load, and align with researchers' workflows. Similarly, ISO 9241-11 (2018) emphasized that usability is a critical factor in determining whether users can effectively achieve their goals with a system. These highlighted the link between system design and successful adoption and reinforced the central role of usability in realizing the potential benefits of technological innovation.

Despite the fact that ETs play a crucial role in enhancing research practices by facilitating tasks such as data analysis, literature search and discovery, and collaborative knowledge, numerous barriers continue to hinder their widespread adoption among researchers. These barriers include limited digital literacy, inadequate infrastructure, insufficient institutional support, high costs, resistance to change, and ethical or privacy concerns, all of which can reduce the

effectiveness and integration of these technologies into regular research workflows. Onyema et al. (2024) stated that limited access to high-speed internet, computers, or other necessary digital tools can create barriers to fully leveraging the potential of ETs for academics. Similarly, Zhu and Yan (2025) identified data privacy, data leakage, and unauthorized access as major risks, noting that AI systems can expose sensitive academic and personal information due to weak data protection and excessive data collection. Furthermore, Mosha et al. (2026) reported that technical challenges such as poor infrastructure, system limitations, and difficult-to-use interfaces cause user frustration and restrict effective use of technologies, thereby negatively affecting academic activities. Studies indicated that lecturers have expressed concerns about plagiarism, data privacy, algorithmic bias, and over-reliance on AI tools, which shape cautious or conditional perceptions of ETs (Zawacki-Richter et al., 2019; Kasneci et al., 2023). These barriers underscore the need for comprehensive strategies that address both technical and human factors in ETs adoption for research. Okojie and Awoyemi (2024) emphasized that researchers are required to possess essential knowledge and skills to gather the necessary literacy and competence required to align the broader goals of AI with that of the academic community.

Despite increasing awareness of ETs, limited empirical research has focused specifically on lecturers' perceptions and usability of these technologies in the research process and practices. Most existing studies focus on teaching, learning, or general technology adoption, leaving a gap in understanding how these tools are utilized for scholarly research. For instance, studies by Mutanga et al. (2024) and Granić (2022) examined AI, digital platforms and ETs in higher education primarily in the context of teaching and student engagement rather than research workflows. Also, Zawacki-Richter et al. (2019) reviewed the adoption of learning analytics and AI tools across universities but noted a paucity of studies addressing the integration of these technologies into research-specific activities, such as literature review automation, data analysis, or collaborative research processes. This highlighted the critical need for empirical investigations that examine both perceptions and usability of ETs among lecturers to better understand adoption patterns and barriers in scholarly research which this study has done.

Methodology

This study adopted a descriptive survey research design to investigate lecturers' perceptions and usability of adopting ETs for research process. The target population comprises lecturers from Federal University Oye-Ekiti. A purposive sampling technique was used to select Five (5) faculties based on their discipline nature and active research involvement and familiarity with digital research tools. Data was collected using a structured questionnaire designed with Google Form, designed to capture information on lecturers' perceptions, extent of use, enablers, and challenges of ETs adoption for research process. The questionnaire employed Likert-scale items for quantitative analysis. The questionnaire link was shared electronically to the respondents via emails and WhatsApp platforms and it was left active for the period of 30 days. Respondents were informed about the purpose of the study and assured of the confidentiality of their responses. The researcher followed up with reminders to ensure a satisfactory response rate. Data obtained was analyzed using descriptive statistics (frequencies, percentages, mean scores and standard deviation) and presented in simple tables for easy interpretation and understanding. Ethical considerations, including informed consent and confidentiality, were strictly observed throughout the study to ensure the protection of respondents' rights.

Data Analysis and Results

Table 1: *Response Rate of the Study according to Faculty*

Faculty	**Frequency**	**Percentage (%)**
Faculty of Arts	32	18.27
Faculty of Communication and Media Studies	24	13.7
Faculty of Computing	13	7.4
Faculty of Education	67	38.2
Faculty of Social Science	39	22.2
Total	**175**	**100**

The distribution of respondents across faculties shows that the Faculty of Education recorded the highest representation with 67(38.2%) respondents, indicating that a substantial proportion of the participants were drawn from education-related disciplines. This suggests that the findings of the study may strongly reflect perspectives from the education sector. The Faculty of Social Science followed with 39(22.2%) respondents, while the Faculty of Arts accounted for 32(18.27%) respondents, both contributing a moderate share of the sample. The Faculty of Communication and Media Studies had 24(13.7%) respondents, indicating a relatively lower level of participation. The least represented faculty was the Faculty of Computing, with only 13(7.4%) respondents, suggesting limited input from technology-oriented disciplines. Generally, the distribution indicates that while the study captured responses from diverse academic fields, participation was uneven, with a strong dominance from the Faculty of Education and comparatively lower

representation from computing-related disciplines. This variation may influence the overall perspectives on ETs, particularly given the differing levels of technological exposure across faculties.

Table 2: *Lecturers' perceptions of ETs and their relevance to research process.*

Lecturers' Perceptions of ETs	SA	A	D	SD	Mean ($\bar{x}$)	Std. Dev. (σ)
The use of emerging technologies enhances the quality of research outputs.	92(52.6)	60(34.3)	15(8.6)	8(4.6)	3.35	0.74
Emerging technologies make literature search and discovery easier.	88(50.3)	65(37.1)	14(8.0)	8(4.6)	3.33	0.73
Emerging technologies are relevant to modern research activities.	95(54.3)	58(33.1)	12(6.9)	10(5.7)	3.36	0.77
The use of emerging technologies improves data analysis accuracy.	85(48.6)	63(36.0)	17(9.7)	10(5.7)	3.28	0.80
Emerging technologies useful in conducting my research tasks.	90(51.4)	60(34.3)	15(8.6)	10(5.7)	3.31	0.79
Emerging technologies are essential tools for contemporary academic research.	87(49.7)	62(35.4)	16(9.1)	10(5.7)	3.29	0.79
The integration of emerging technologies positively impacts research productivity.	89(50.9)	61(34.9)	14(8.0)	11(6.3)	3.30	0.81
Emerging technologies simplify collaboration among researchers.	80(45.7)	66(37.7)	18(10.3)	11(6.3)	3.23	0.82
Emerging technologies support innovation in research practices.	93(53.1)	58(33.1)	14(8.0)	10(5.7)	3.34	0.78
Emerging technologies improve the overall efficiency of the research process.	91(52.0)	60(34.3)	14(8.0)	10(5.7)	3.33	0.79
Grand Mean = 3.31						

Decision Rule: *If Mean Range is 1.00 – 1.49 (Strongly Disagree); 1.50 – 2.49 (Disagree); 2.50 – 3.49 (Agree) and 3.50 – 4.00 (Strongly Agree).*

The analysis of lecturers' perceptions of ETs reveals a strongly positive disposition toward their use in research processes. Across all items, the majority of respondents selected Strongly Agree (SA) and Agree (A), with combined percentages consistently exceeding 80%, indicating widespread acceptance of the relevance and usefulness of ETs in academic research. Specifically, over half of the respondents strongly agreed that ETs enhance the quality of research outputs (52.6%), support innovation in research practices (53.1%), and improve overall research efficiency (52.0%). Similarly, a significant proportion acknowledged that these technologies make literature search and discovery easier (50.3%) and are relevant to modern research activities (54.3%). These findings suggest that lecturers recognize the transformative potential of ETs in improving research effectiveness and productivity. Although a small proportion of respondents expressed disagreement across some items (generally below 10%), this indicates minimal resistance and suggests that negative perceptions are relatively limited. The mean scores for all items range between 3.23 and 3.36, with a grand mean of 3.31, confirming that lecturers generally agree with the positive statements regarding ETs. Furthermore, the relatively low standard deviation values (approximately 0.73–0.82) indicate consistency in responses, suggesting that lecturers share similar views on the benefits and relevance of ETs in research process.

Table 3: *Extent use of emerging technologies in various stages of research process.*

Extent of Use of ETs	SA	A	D	SD	Mean ($\bar{x}$)	Std. Dev. (σ)
I use emerging technologies for literature search and review.	70(40.0)	68(38.9)	25(14.3)	12(6.9)	3.12	0.89
I use emerging technologies for research writing and editing.	65(37.1)	70(40.0)	28(16.0)	12(6.9)	3.07	0.90
I use emerging technologies for dissemination of research findings.	55(31.4)	72(41.1)	32(18.3)	16(9.1)	2.95	0.96
I use emerging technologies for referencing and citation management.	60(34.3)	68(38.9)	30(17.1)	17(9.7)	2.97	0.97
I use AI-powered tools (e.g., text generation, analytics tools) in my research work.	50(28.6)	65(37.1)	35(20.0)	25(14.3)	2.80	1.05

I use emerging technologies for data collection.	58(33.1)	66(37.7)	32(18.3)	19(10.9)	2.93	0.99
I integrate digital platforms and tools throughout my research process.	57(32.6)	67(38.3)	31(17.7)	20(11.4)	2.92	1.00
I use emerging technologies for collaboration with other researchers.	62(35.4)	69(39.4)	27(15.4)	17(9.7)	3.00	0.96
I use emerging technologies for data visualization.	52(29.7)	64(36.6)	34(19.4)	25(14.3)	2.82	1.04
I use emerging technologies for data analysis.	54(30.9)	66(37.7)	33(18.9)	22(12.6)	2.87	1.02
Grand Mean = 2.95						

Decision Rule: *If Mean Range is 1.00 – 1.49 (Strongly Disagree); 1.50 – 2.49 (Disagree); 2.50 – 3.49 (Agree) and 3.50 – 4.00 (Strongly Agree).*

The analysis of the extent to which lecturers use ETs in the research process indicates a moderate level of utilization across the various stages of research activities. The results show that the majority of respondents selected Strongly Agree (SA) and Agree (A) across most items, although the combined percentages are generally lower than those observed for perception, suggesting a gap between perception and actual usage. Specifically, the highest levels of use were recorded in literature search and review (40.0% SA, 38.9% A; $\bar{x}$ = 3.12) and research writing and editing (37.1% SA, 40.0% A; $\bar{x}$ = 3.07), indicating that lecturers are more comfortable applying ETs in these foundational aspects of research. Similarly, a considerable proportion of respondents reported using these technologies for collaboration with other researchers ($\bar{x}$ = 3.00), reflecting the role of digital platforms in facilitating academic interaction. However, usage is relatively lower in more advanced or specialized areas. For instance, the use of AI-powered tools recorded the lowest mean score ($\bar{x}$ = 2.80), followed by data visualization ($\bar{x}$ = 2.82) and data analysis ($\bar{x}$ = 2.87), suggesting limited integration of sophisticated technologies into research workflows. Additionally, moderate usage levels were observed in data collection, referencing and citation management, and dissemination of research findings, with mean scores ranging between 2.92 and 2.97. The grand mean of 2.95 further confirms that lecturers utilize ETs to a moderate extent in their research process. The relatively higher standard deviation values (approximately 0.89–1.05) indicate variation in usage patterns, implying that while some lecturers actively use these technologies, others use them minimally.

Table 4: *Enablers of adoption and use of emerging technologies for research process.*

Enablers of Adoption and Use of ETs	SA	A	D	SD	Mean ($\bar{x}$)	Std. Dev. (σ)
Availability of reliable internet access enables my use of emerging technologies for research.	85(48.6)	62(35.4)	18 (10.3)	10(5.7)	3.27	0.81
My level of digital literacy enables me to adopt emerging technologies in research.	80(45.7)	65(37.1)	20 (11.4)	10(5.7)	3.23	0.82
Access to online databases and digital libraries supports my research activities.	88(50.3)	60(34.3)	17 (9.7)	10(5.7)	3.30	0.80
Positive attitude toward technology encourages my use of emerging tools.	90(51.4)	58(33.1)	17 (9.7)	10(5.7)	3.31	0.80
Access to up-to-date digital tools and software supports my adoption of emerging technologies.	82(46.9)	63(36.0)	20 (11.4)	10(5.7)	3.24	0.82
Availability of funding or grants supports my use of emerging technologies.	70(40.0)	65(37.1)	25 (14.3)	15(8.6)	3.09	0.90
Institutional provision of research technologies encourages my use of emerging tools.	78(44.6)	64(36.6)	21 (12.0)	12(6.9)	3.19	0.85
Perceived usefulness of emerging technologies motivates me to adopt them.	92(52.6)	55(31.4)	18 (10.3)	10(5.7)	3.32	0.80
Ease of use of emerging technologies encourages their integration into my research.	84(48.0)	61(34.9)	20(11.4)	10(5.7)	3.25	0.82
Collaboration with colleagues enhances my use of emerging technologies.	76(43.4)	66(37.7)	21(12.0)	12(6.9)	3.18	0.85
Grand Mean = 3.24						

Decision Rule: *If Mean Range is 1.00 – 1.49 (Strongly Disagree); 1.50 – 2.49 (Disagree); 2.50 – 3.49 (Agree) and 3.50 – 4.00 (Strongly Agree).*

The analysis of enablers of lecturers' adoption and use of ETs reveals a generally high level of agreement among respondents, indicating that several facilitating factors support the integration of these technologies into research processes. Across all items, the majority of respondents selected Strongly Agree (SA) and Agree (A), with combined

percentages consistently above 75%, suggesting that these enablers are widely recognized. Notably, perceived usefulness of ETs recorded the highest mean score ($\bar{x}$ = 3.32), indicating that lecturers are strongly motivated to adopt technologies when they perceive clear benefits for their research processes. This is closely followed by positive attitude toward technology ($\bar{x}$ = 3.31) and access to online databases and digital libraries ($\bar{x}$ = 3.30), highlighting the importance of both individual disposition and availability of research resources in driving adoption. Similarly, availability of reliable internet access ($\bar{x}$ = 3.27), ease of use of technologies ($\bar{x}$ = 3.25), and access to up-to-date digital tools and software ($\bar{x}$ = 3.24) were identified as strong enablers, emphasizing the role of infrastructure and usability in facilitating effective use. Digital literacy ($\bar{x}$ = 3.23) also emerged as a critical enabler, indicating that lecturers' competence with digital tools allows their ability to adopt ETs. However, some factors showed relatively lower influence. For instance, availability of funding or grants recorded the lowest mean score ($\bar{x}$ = 3.09), suggesting that financial support, although important, may not be as strong an enabler as perceived usefulness or accessibility. Likewise, institutional provision of research technologies ($\bar{x}$ = 3.19) and collaboration with colleagues ($\bar{x}$ = 3.18) were moderately rated, indicating room for improvement in institutional and collaborative support systems. The grand mean of 3.24 confirms that enablers of adoption and use of ETs are strongly present among lecturers. Additionally, the relatively low standard deviation values (approximately 0.80–0.90) indicate consistency in responses, suggesting that lecturers share similar views regarding the factors that facilitate technology adoption.

Table 5: *Challenges of adopting emerging technologies for research process*

Challenges of Adoption of ETs	SA	A	D	SD	Mean ($\bar{x}$)	Std. Dev. (σ)
Poor internet connectivity limits my use of emerging technologies.	35(20.0)	47(26.8)	51(29.1)	42 (24.0)	2.43	1.06
Inadequate digital skills when using emerging technologies.	60(34.3)	85(48.6)	10(5.7)	20 (11.4)	3.06	0.92
I find some emerging technologies complex and difficult to use.	62(35.4)	80(45.7)	12(6.9)	21(12.0)	3.05	0.95
Ethical concerns (e.g., plagiarism, data privacy) discourage my use of emerging technologies.	78(44.6)	60(34.3)	22(12.6)	15(8.6)	3.15	0.90
Time constraints make it difficult to learn and use emerging technologies.	58(33.1)	88(50.3)	10(5.7)	19(10.9)	3.06	0.91
Lack of institutional support hinders my use of emerging technologies.	82(46.9)	63(36.0)	20(11.4)	10(5.7)	3.24	0.82
Lack of training opportunities affects my ability to use emerging technologies.	86(49.1)	60(34.3)	19(10.9)	10(5.7)	3.27	0.82
Limited access to relevant tools and software affects my research process.	84(48.0)	61(34.9)	20(11.4)	10(5.7)	3.25	0.82
Resistance to change affects my willingness to adopt new technologies.	70(40.0)	65(37.1)	25(14.3)	15(8.6)	3.09	0.92
High cost of technology tools limits their use in my research.	90(51.4)	58(33.1)	17(9.7)	10(5.7)	3.30	0.83
Grand Mean = 2.99						

Decision Rule: *If Mean Range is 1.00 – 1.49 (Strongly Disagree); 1.50 – 2.49 (Disagree); 2.50 – 3.49 (Agree) and 3.50 – 4.00 (Strongly Agree).*

The analysis of challenges affecting lecturers' adoption of ETs reveals a generally high level of agreement that several factors hinder effective utilization of these tools in research processes. The grand mean of 2.99 indicates that respondents agree to a moderate extent that these challenges exist, suggesting that barriers to adoption are noticeable but vary in intensity across different factors. Among the identified challenges, high cost of technology tools ($\bar{x}$ = 3.30), lack of training opportunities ($\bar{x}$ = 3.27), and limited access to relevant tools and software ($\bar{x}$ = 3.25) emerged as the most notable constraints. This suggests that institutional and financial limitations play a major role in restricting lecturers' effective use of ETs. Similarly, lack of institutional support ($\bar{x}$ = 3.24) was also highly rated, indicating that inadequate organizational backing continues to hinder technology integration in research activities. Other notable challenges include ethical concerns such as plagiarism and data privacy ($\bar{x}$ = 3.15), as well as resistance to change ($\bar{x}$ = 3.09), which reflect psychological and ethical dimensions affecting adoption behavior. These findings suggest that beyond infrastructural issues, personal attitudes and ethical considerations also shape lecturers' engagement with ETs. Furthermore, challenges such as inadequate digital skills ($\bar{x}$ = 3.06), time constraints ($\bar{x}$ = 3.06), and complexity of technologies ($\bar{x}$ = 3.05) indicate that capacity-related issues also affecting usage. However, poor internet connectivity

($\bar{x}$ = 2.43) recorded the lowest mean, suggesting that while it remains a barrier, it is relatively less severe compared to other challenges in this study context.

Discussion of Findings

The findings of this study reveal that lecturers generally hold a positive perception of ETs, with a grand mean of 3.31, indicating agreement that such technologies enhance research quality, efficiency, collaboration, and innovation. This aligns with recent systematic reviews which show that ETs such as artificial intelligence, learning analytics, and extended reality are increasingly perceived as valuable tools for improving academic performance, enhancing efficiency, and supporting collaborative and innovative research practices (Sembey et al., 2024; Matos, et al., 2025). It also aligns with the Technology Acceptance Model (TAM) by Davis (1989), which posits that perceived usefulness and perceived ease of use significantly influence users' acceptance of technology. In this study, lecturers' strong agreement that ETs improve research processes suggests that perception is a key driver of potential adoption. In addition, Mena-Guacas et al. (2025) emphasized that ETs foster collaboration, interaction, and innovation by enabling dynamic engagement with digital tools and research environments, which strengthens their perceived relevance and usefulness in academic contexts. These findings collectively support the conclusion that positive perceptions among lecturers are driven by the observable benefits of ETs in enhancing research productivity and scholarly outcomes.

However, despite this positive perception, the extent of actual use of ETs is only moderate (grand mean = 2.95). This indicates a clear gap between perception and practice, where awareness and positive attitudes do not fully translate into consistent or advanced usage. This finding supports recent study by Sofi and Al-Fattal (2026), which identify a persistent "attitude–behaviour gap" in technology adoption, where favourable perceptions do not always result in actual use. Similarly, Galimova et al. (2024) revealed that although perceived usefulness and ease of use significantly influence behavioural intention, external factors such as accessibility, training, and institutional support determine whether intention is translated into actual usage. Furthermore, Zawacki-Richter et al. (2019) observed that although academics recognize the value of AI and digital tools in higher education, their practical integration into research activities remains limited due to contextual constraints. Also, a recent study by Maziriri (2026) highlights the broader intention–behaviour gap, showing that individuals may express strong positive attitudes toward technologies but fail to adopt them in practice due to complexity, uncertainty, or contextual limitations. These findings collectively explain why, despite positive perceptions of ETs, their actual use among lecturers remains moderate.

The study further found that the key enablers of adoption include perceived usefulness, positive attitude, access to digital resources, internet availability, and ease of use. These findings are consistent with recent systematic reviews by Feng et al. (2025), which identify perceived usefulness, ease of use, and facilitating conditions as core determinants of technology adoption across educational and research contexts. Found that performance expectancy (perceived usefulness) and effort expectancy (ease of use) significantly influence technology adoption, while facilitating conditions such as infrastructure and technical support serve as critical enablers of actual use. Similarly, Venkatesh et al. (2003) in the Unified Theory of Acceptance and Use of Technology (UTAUT), which emphasized performance expectancy, effort expectancy, and facilitating conditions as major predictors of technology adoption. Institutional support and digital literacy also emerged as important enablers, highlighting the role of both organizational and individual readiness. Furthermore, a recent study Susanto et al. (2026), grounded in the Technology Acceptance Model showed that perceived usefulness and perceived ease of use remain the most influential predictors of technology adoption, shaping users' attitudes and behavioural intentions toward usage. In addition, empirical evidence from developing contexts indicated that internet availability, access to digital resources, and institutional support significantly enhance technology adoption, while poor infrastructure constrains usage (Muraina et al., 2025). Also, Duan et al. (2026) highlighted that positive user attitudes, digital literacy, and enabling environments (such as reliable internet and access to tools) play a crucial role in translating intention into actual technology use, reinforcing the importance of both psychological and infrastructural enablers in adoption processes.

Conversely, the study identified several challenges that hinder adoption of ETs. The most prominent barriers include high cost of technology, lack of training opportunities, limited access to tools, and inadequate institutional support. These findings corroborate recent systematic reviews which consistently report that financial constraints, insufficient digital skills, poor infrastructure, and weak institutional support remain major obstacles to effective technology adoption in higher education and research environments (Sembey et al., 2024; Adil, 2025). Also, a recent empirical by Muraina et al. (2025) revealed that poor access to digital resources and insufficient institutional readiness are persistent barriers that prevent sustained use of ETs in academic settings. Furthermore, Bond et al. (2023) found that limited funding, inadequate training, and lack of technical support significantly reduce users' ability to fully integrate digital tools into academic work, even when perceptions are positive and intention to use is high. In addition, a recent review on AI and digital transformation in education by Liu and Yushchik (2024) highlighted that cost of implementation, lack of technical

capacity, and weak organizational support structures are key limiting factors affecting adoption and scalability of ETs. These studies collectively suggest that despite the transformative potential of ETs, their effective adoption is constrained by structural, financial, and capacity-related challenges within academic institutions.

Conclusion

This study examined lecturers' perceptions, extent of use, enablers, and challenges of adopting ETs in the research process. The findings reveal that lecturers generally hold a positive perception of ETs, recognizing their importance in enhancing research quality, efficiency, collaboration, and innovation. This strong perception indicates that lecturers are aware of the potential benefits of these technologies in advancing scholarly research. However, despite this positive outlook, the actual extent of use of ETs remains moderate, suggesting a noticeable gap between awareness and practical application. While lecturers frequently use ETs for basic tasks such as literature search, writing, and collaboration, their use of more advanced tools such as AI-powered applications, data visualization, and data analysis remains relatively limited. The study further established that key enablers of adoption include perceived usefulness, ease of use, positive attitude toward technology, access to digital resources, internet availability, and institutional support. These factors collectively facilitate lecturers' willingness and ability to integrate ETs into their research activities. Conversely, several challenges hinder effective adoption, including high cost of technology tools, lack of training opportunities, inadequate institutional support, limited access to relevant software, and insufficient digital skills. Ethical concerns and resistance to change also contribute to the slow pace of adoption. The study concludes that although lecturers are positively inclined toward ETs, their full integration into research processes is constrained by structural, institutional, and individual barriers. Bridging this gap requires sustained investment in digital infrastructure, capacity-building programs, and supportive institutional policies that encourage the effective and ethical use of ETs in academic research.

Recommendations

Based on the findings of the study, the following recommendations are made to enhance lecturers' adoption and effective use of ETs in the research process:

1. The university should organize regular workshops, seminars, and hands-on training programmes to improve lecturers' digital literacy and technical competence in using ETs such as AI tools, data analytics software, and digital research platforms.
2. The university should invest in reliable internet connectivity, updated digital tools, and research software to ensure seamless access to ETs across all academic departments.
3. Government and university management should provide dedicated funding or grants to support the acquisition of research technologies and subscription to relevant academic databases and software tools.
4. Continuous professional development programmes should be introduced to enhance lecturers' confidence and competence in using advanced digital tools for research purposes.
5. Awareness campaigns should be carried out to reduce resistance to change and encourage lecturers to embrace ETs as essential tools for modern research.
6. The university should provide clear ethical guidelines on the use of ETs, particularly regarding plagiarism, data privacy, and responsible use of AI tools in research.
7. The university should encourage collaboration among lecturers through digital platforms to promote peer learning and shared use of ETs in research activities.

Suggestions for Further Research

Based on the scope and findings of this study, the following areas are suggested for further investigation:

1. Further studies may extend the investigation to postgraduate students and early-career researchers, to understand how ETs influence research development across different academic levels.
2. Future studies should consider conducting a comparative analysis across different faculties or universities to determine whether lecturers' perceptions and usage of ETs vary across diverse academic disciplines and environments.
3. Further research could adopt a mixed-methods approach, combining quantitative surveys with qualitative interviews or focus group discussions to gain deeper insights into lecturers lived experiences with ETs.
4. Studies may also examine the impact of specific ETs (e.g., artificial intelligence tools, machine learning applications, or data analytics software) on individual aspects of research productivity such as publication output, research quality, and citation impact.
5. Future research should explore the role of institutional leadership and policy frameworks in shaping the adoption and sustainability of ETs in higher education research practices.

ABSTRACT

This study explored the future of Library and Information Science in Nigeria through a systematic and descriptive content analysis of articles published in the Lokoja Journal of Information Science Research (LJISR). The Journal is a publication of the Department of Library and Information Science at Federal University Lokoja, Nigeria. Analyzing the contents of these articles provided valuable insight into the evolving direction of LIS in Nigeria. By means of a well-structured content analysis checklist, seventy peer-reviewed research articles were subjected to analysis in this article to identify dominant research themes, methodological orientations, authorship patterns, and their conformity with contemporary LIS development. The research findings indicate that the libraries in Nigeria place a great emphasis on ICT and digital. Research on user studies and information literacy also was featured prominently, showing sustained interest in access, user behaviour and service effectiveness. There is also a growing intellectual interest in knowledge management, research data management, and health information. Methodologically, the journal shows a heavy reliance on quantitative survey design, with limited use of qualitative or mixed-method approaches. Authorship analysis indicates a high level of inter-institutional collaboration within Nigeria and no international collaboration. The study concluded that while LJISR effectively captures indigenous scholarship and national technological adaptations, there is a need to align with global trends while responding to local realities. The study therefore recommended greater methodological diversity, increased international collaboration, and expanded attention to underexplored thematic areas to strengthen the future relevance and impact of Nigerian LIS scholarship. It was concluded that Lokoja Journal of Information Science Research has demonstrated strong relevance as a platform for documenting and advancing the intellectual direction of Library and Information Science research in Nigeria which covers major trends in digital transformation, new technologies, digital information literacy, scholarly communication and research support.

INTRODUCTION

Scholarly journals is one of the central infrastructures of scholarly communication. This has remained one of the major mechanisms through which scholarship is evaluated, improved and made trustworthy over the years. Academic journals are the principal platform through which scholars articulate, negotiate and reposition their research agendas. They do not function as passive repositories of complete research but acts as active gatekeepers that determine which topics gain legitimacy, which methodologies become normative, and which research directions receive sustained attention. The impact of journals on society is wider than academia as they facilitate the conversion of research into public knowledge. When scholarly work is effectively published, discovered, and preserved, it becomes available for teaching, policy, professional practice, innovation, community development, health communication, and informed public debate. Supporting this assertion Tenopir et al (2021) asserts that journals bridge the gap between research and practice; making sure that a new knowledge is not flowing between academics but also to policymakers, practitioners and the public. Journals have many uses in the life of scholars and researchers.

i. Journals serve as a lasting record of intellectual development. Knowledge is never in isolation; hence every issue adds to the knowledge base of future researchers. (Smith, 2020) The absence of this archival function could result in losses, fragmentation, or distortions.
ii. Published Journals serve as agenda-setting. What journals publish influences what students read, what practitioners adopt, what researchers imitate, and what institutions consider legitimate lines of inquiry
iii. Scholars get recognized in their field mainly by publishing their research in respectable journals or any other academic contribution.

iv. Scholarly journals bring together academicians to interface with other scholars anywhere in the world. This fosters inter-disciplinary cooperation and allows for ideas to become available worldwide (Beall, 2023)

Scholarly journals also have an impact on curriculum development, institutional policies, library practices, and the development of professional positions. For instance, library services and information management policies may rely on peer-reviewed evidence published in reputable journals.

Content Analysis of Journals

Journal articles as the primary evidence base for identifying how the field evolves over time, what topics gain legitimacy, what methods are normalized, and which lines of inquiry become central or marginal. Aharony (2012) posits that content analysis provides insight into the development of a profession as it indicates the subject trends and major issues that occupy the profession within a given period of time. Scholars have established that large-scale content analyses of LIS journals have shown that shifts in article topics, units of analysis, and methodological choices provide a reliable way to trace disciplinary change longitudinally (Aharony, 2012; Armann-Keown & Patterson, 2020; Järvelin & Vakkari, 2022; Tuomaala et al., 2014). For a field like LIS, where professional practice and scholarly discourse are tightly intertwined, journal content can therefore be read as a special useful indicator of emerging priorities, silences, methodological preferences, and collaborative patterns. This makes journal-based content analysis a credible route for evaluating how Nigerian LIS scholarship is positioning itself in relation to both local and global realities. Content analysis assists in analyzing the dominant themes, research approaches, data collection methods, authorship patterns, type of evidence, and intellectual evolution of a discipline, among others.

Lokoja Journal of Information Science Research

Lokoja Journal of Information Science Research is a Gold Open Access, peer-reviewed, bi-annual academic journal published by the Department of Library and Information Science at Federal University Lokoja Kogi State Nigeria. The journal was established in 2023 and has published six volumes. The scope of the journal includes librarianship, information science, data management, big data, digital scholarship, scholarly communication, digital and information literacy, fake news, digital information systems, and knowledge management. This relevance matters greatly for a study of emerging trends because it captures many of the major themes shaping LIS globally. Manuscripts are accepted continuously through out the year and published twice in the year. This ensures that the journal remain s responsive to the rapid development and current trends in LIS.

Statement of the Research Problem

Academic journals have been recognized as a major tool that provide evidence of dominant research interest, methodological orientation and for disseminating research outcomes. They also serve as primary mechanism through which academic disciplines define, negotiate and redirect their research agendas. A systematic analysis of all the contents of LIS journals is essential for understanding the growth, direction and future priorities of the discipline. The study of Library and Information Science have been thriving in the wake of the digital savvy users and emerging technologies. Despite the growth of LIS journals in Nigeria, there is little or no systematic evidence on their themes, methods, authorship patterns, affiliations, and trends. LJISR provides a platform for researchers to publish their articles, however the extent to which the articles published in the journal reflect emerging trends shaping the future of Library and Information Science in Nigeria has not been sufficiently examined through a systematic content analysis. This creates a knowledge gap in understanding the journal's intellectual contribution and relevance to LIS development. This study therefore seeks to conduct a content analysis of articles published in LJISR in order to identify dominant research themes, methodological approaches, authorship and institutional patterns, and the extent to which the journal reflects emerging global trends shaping the future of Library and Information Science research in Nigeria.

Research Objectives

i. To identify the dominant research themes covered in articles published in the Lokoja Journal of Information Science Research
ii. To identify the research methodologies and statistical techniques used in the article published
iii. To analyse the authorship patterns, collaboration trends, and instructional affiliations of contributors
iv. To determine the extent to which the articles reflect emerging global trends shaping library and information science research in Nigeria
v.

Literature Review

Literatures related to the area of the study was reviewed. Hence an overview of a discourse domain in dominant themes and topics published in LIS journal; authorship patterns and collaboration trends; authors institutional collaboration in LIS Research; research methodologies and statistical techniques used; and Emerging Global Trends in Library and Information Science Research

Dominant Themes and Topics Published in LIS Journals

There is a significant paradigm shift in the research themes of library and information science (LIS), from traditional focuses like classification, cataloguing, library services, information-seeking behaviour, bibliographic control, information retrieval etc., towards the digital transformation and data-centric. Currently researches are being dominated by the innovative technologies, namely, artificial intelligence (AI), big data and blockchain technology, which are bringing changes in information management and library services. The technological evolution is accompanied by a rise in scholarly communication and open access research which have emerged as high-growth dominant areas of investigation. Even though there is shift from traditional library themes, themes such as information literacy, information seeking behavior and user education remain stable across literatures (Ma & Lund, 2021). There is a notable increase in research that focus on social and ethical aspects of digital technology, data privacy, digital divide and artificial intelligence. Emerging research trends are increasingly shaped by emerging issues such as artificial intelligence, digital transformation, misinformation, data ethics, open science, digital inclusion, and the changing information behavior of users in digital environment (IFLA, 2024). Therefore, dominant library and information science research themes are no longer limited to traditional library operations, they now include broader concerns about access to information technology adoption, digital equity, and artificial intelligent.

Authorship Patterns and Collaboration Trends

Authorship patterns depict the occurrence of single-authored and multi-authored publications. Studies have shown that authorship patterns in library and information science have undergone a definitive transition from a traditional solo scholarship to a predominantly collaborative model (Heneberg & Chumanchenko, 2025 and Song et al., 2025). It can be argued that the infusion of technology and interdisciplinary nature of LIS have been the driving force toward collaborative and multi-authored research. Supporting this assertion Thavamani (2015) and Abu & Verma (2019) asserts that research on LIS journals has demonstrated that co-authorship is increasingly prevalent, especially regarding digital libraries, bibliometrics, information behaviour, scholarly communication and information technology. To illustrate, Abu and Verma (2019) discovered that most articles in the Annals of Library and Information Studies were multi-authored, indicating a strong level of cooperation among LIS researchers. Author collaboration enhances intellectual exchange, enhances credibility, engenders mentorship, fosters interdisciplinary thinking, and improves distribution and impact in scholarly writing. Supporting this assertions Kademani et al., (2005), posits that collaboration between researchers enhances research quality as authors can share ideas, critique each other's argument, improve the design of research and produce more robust scholarly work. Recent Nigerian LIS journal studies show that two-author and institutional collaboration are becoming more visible, although international collaboration remains relative limited (Martins & Joshua, 2024).

Authors Institutional Collaboration in LIS Research

Authors' institutional affiliation collaboration in research refers to research publication of authors who are from the same institution, different institution and from different country. It is an important indicator to measure the magnitude of research networking, institutional productivity, scholarly diversity, and knowledge sharing in discipline. The increasing dominance of authors collaboration both within and between institutions has been documented to enhance efficiency and productivity as well as produce better science (Wuchty, Jones & Uzzi, 2007). The institutional affiliation of authors is one of the most common attributes of authorship studied in LIS. It is usually studied along with some of the following attributes: authorship, occupation, National Affiliation, co-authorship, etc. The importance of institutional collaboration indicates whether a few institutions dominate LIS research or whether it is a reflection of wider participation of universities, libraries, research centres and professional communities. According to Owens (2023), co-authorship in academic librarianship journals is on the rise emphasizing that global cooperation in LIS can enhance the quality of research and broaden its visibility. It follows that by examining the institutional affiliations of authors in LIS research, one can understand the collaboration patterns, the representation of institutions, inclusiveness of research and the degree to which LIS scholarship benefits from wider academic and professional networks.

Research Methodologies and Statistical Techniques Used

Research methods and statistical techniques are essential indicators of the processing quality, empirical strength, and methodological direction of journal articles. The studies on Library and Information Science (LIS) articles have shown that survey research, content analysis, bibliometric analysis, case study, experimental design, a qualitative inquiry, and mixed-methods are largely used (Chu, 2015; Hider & Pymm, 2008). Earlier content analysis of LIS journal articles also revealed that empirical research strategies have remained central to the discipline particularly in studies dealing with information use, library services, information retrieval and user behaviour (Järvelin & Vakkari, 1993). Statistical techniques used in literature information science articles depend on the type of research and data. But the mostly included are frequency counts, percentages, mean, standard deviation, correlation, chi-square, regression, and other inferential statistics. These statistical analysis support objective interpretations of data and strengthen the credibility of findings. As a result, a detailed analysis of the methods and statistical tools used in these articles helps us to determine whether the articles being published are descriptive, empirical, qualitative, quantitative, or mixed-methods type. Chu (2015) further observed that LIS research has expanded in its use of diverse methods, showing that methodology and statistical analysis are useful indicators of research maturity, rigour and disciplinary growth.

Emerging Global Trends in Library and Information Science Research

The emerging global trends in LIS research are increasingly driven digital technology, Artificial Intelligence, open science, research data management, disinformation, digital inclusion, user experience, and ethical information governance. The 2024 IFLA Trend Report shows that the future of libraries is being influenced by changes in the information and knowledge environment including technology, trust and access, privacy, sustainable development and other similar issues (Dezuanni et al. 2024). Furthermore, current reports on academic library trends reveal that library research and practice are now mainly focused on generative AI, AI literacy, open access and open science, student well-being, and the digital learning environment (ACRL Research Planning and Review Committee, 2024). Research in Artificial intelligence in library relates to information retrieval, knowledge organisation, user-centred services, digital information management, and ethical issues as well (Islam & Guangwei, 2025). Furthermore, another important global trend is that of research data management. Libraries are being increasingly expected to support data sharing, reuse, preservation, data literacy, and open research practices (Subaveerapandiyan & Ugwulebo, 2024). Consequently, LIS research is broadening its focus from traditional library services to encompass digital innovation, ideal technology, openness, data and information stewardship, information ethics and equitable access to knowledge.

Methodology

The methodology adopted for this study was descriptive content analysis in order to examine, quantify and analyze articles published in the Lokoja Journal of Information Science Research from 2023 to 2025. Library and information Science researchers have used this methodology to analyze a variety of data sources. According to Krippendorff (2013), descriptive content analysis, is a research technique often used in the social sciences "for making replicable and valid inferences from texts to the contexts of their use". Beck and Manuel (2008) posits that descriptive content analysis is a very attractive method for library researchers because it is non-reactive, unobtrusive, and not limited by geography location. It has been adopted by many disciplines to analyze documentation and communications of various formats, including journal articles

The population of the study consisted 70 articles that were published in Lokoja Journal of Information Science Research (LJISR) from 2023 through 2025 (Volumes 1–6). The entire population of the study was taken as the sample size because of the small size. A structured content analysis checklist was used as the instrument for data collection. The checklist captured variables such as article title, year of publication, research theme, methodology adopted, statistical techniques used, number of authors, pattern of collaboration and emerging global trends in Library and information Science. Data for the content analysis of journal articles was collected from the official site of the journal https://ljisr.net.ng/lis/en. The data collected was analysed using frequency counts, percentages, and tables to show patterns and tends in the published article.

Data Analysis

This data analysis aims to conduct a systematic empirical assessment of the Lokoja Journal of Information Science Research (LJISR). This was based on the journal's 2023-2025 volumes. This section examines a sample of 70 peer-reviewed articles to break down the journal's structural, thematic, and methodological configurations. The distribution of the 70 articles in six different journal issues for a period of three years is shown in table 1. The number of publications remains fairly stable, having between at least 9 articles in Vol. 2 No.1 (2024) and a maximum of 14 articles in Vo. 2 No.2 (2024).

Table 1: Articles Published in LJISR from 2023 - 2025

S/N	Volume/Issue	Year	No. of articles identified
1	Vol. 1 No. 1	2023	12
2	Vol. 1 No. 2	2023	13
3	Vol. 2 No. 1	2024	9
4	Vol. 2 No. 2	2024	14
5	Vol. 3 No. 1	2025	11
6	Vol. 3 No. 2	2025	11
Total Articles			70

Dominant Research Themes Covered in Articles Published in LJISR (2023–2024)?

The study sought to identify the dominant research themes covered in the articles published in LJISR between 2023 – 2025. The result is shown in Table 2, and from the thematic analysis of the 70 articles, ten (10) dominant theme clusters ranked by frequency of occurrence were established. The analysis revealed that Digital and open educational resources and library systems top the rank with 20.0%, closely followed by emerging technologies, AI and automation with 18.6%.

Community, inclusion and development communication as well as Environmental information, climate and disaster management were the least dominant theme with 4.3%

Table 2: Dominant Themes Across All LJISR Issues

Rank	Dominant theme	No. of articles	Approx. share
1	Digital/open educational resources and library systems	14	20.0%
2	Emerging technologies, AI and automation	13	18.6%
3	Information literacy, user education and information behavior	8	11.4%
4	Scholarly communication, research productivity and research support	8	11.4%
5	Library workforce, competencies and job performance	6	8.6%
6	Health information, misinformation and bibliotherapy	6	8.6%
7	Library services, user engagement and marketing	5	7.1%
8	Records, archives and information management	4	5.7%
9	Community, inclusion and development communication	3	4.3%
10	Environmental information, climate and disaster management	3	4.3%
TOTAL		70	100%

The data clearly indicates that more than one-third of the journal's scholarly output focuses in technology-mediated information services and digital innovation

Research Design in LJISR (2023-2025)

Table 3 provides a detailed breakdown of research methodologies employed in LJISR articles from 2023 to 2025, categorizing studies by research design and presenting both frequency and percentage distributions. This analysis is crucial for understanding the epistemological approaches, empirical strategies, and methodological preferences that characterize LJISR scholarship over the years. It was discovered that survey research is the dominant methodology, with 48 articles representing 68.6%. This is closely followed by descriptive survey with 35 articles representing 50.0%. Experimental or quasi-experimental design is the most unpopular research design appeared in only 1 article, representing 1.4%.

Table 3: Research Methodologies in LJISR (2023–2025)

Research Design	Frequency	Percentage
Survey Research	48	68.6%
Descriptive Survey	35	50.0%
Literature Review/Survey	8	11.4%
Case Study	6	8.6%
Comparative Study	3	4.3%
Content Analysis	2	2.9%
Experimental/Quasi-Experimental	1	1.4%
Mixed Methods	2	2.9%

This reliance on descriptive surveys implies that while the field is generating plenty of measurable data, it lacks deep, context-rich qualitative insight. Relying heavily on self-reported survey data can limit the critical rigor and global impact of the journal's scholarship.

Authorship Pattern

Table 4 shows the authorship pattern of the 70 articles published in LJISR between the years of 2023 to 2025. The publications are categorized according to their number of authors from single-authored to five-or-more co-authored. Authorship patterns indicate collaborative culture, knowledge production and distribution mechanisms as well as scholarly networking in a discipline.

Table 4: Authorship Pattern

Authorship Type	Number of Articles	Percentage
Single Author	18	25.7%
Two Authors	28	40.0%
Three Authors	15	21.4%
Four Authors	6	8.6%
Five or More Authors	3	4.3%

According to the data in table 4, the single-authored articles were 18 (25.7 %). Most publications (28 articles) comprised two authors, representing 40.0%. Out of the total 70 articles, 15 articles or 21.4% were by three-author articles followed by 6 articles or 8.6% were by four-author articles. The least represented were articles with five or more authors, which had 3 publications, 4.3%.

Institutional Collaboration

Detailed analysis of institutional collaboration patterns among the authors of LJISR from 2023 to 2025 is shown in table 5. This analysis reveals whether LJISR research is intra-institutional (authors were from the same institution), inter-institutional domestic (authors were from different Nigeria institutions), or international (authors were Nigerian and foreign institutions). The awareness of the collaborative pattern of institutions will help determine the extent of scholarly networks and knowledge flow patterns

Table 5: Institutional Collaboration Types

Collaboration Type	Number	Percentage
Intra-institutional	38	54.3%
Inter-institutional (Domestic)	24	34.3%
Inter-institutional (International)	0	0.0%
Single Author	18	25.7%

Table 5 presents the institutional collaboration patterns represented in LJISR articles. The data show that intra-institutional collaboration had the highest occurrence, with 38 articles representing 54.3%. Inter-institutional domestic collaboration accounted for 24 articles, representing 34.3%. International collaboration recorded 0 articles, representing 0.0%, while single-author articles accounted for 18 publications, representing 25.7%

Alignment of LJISR Articles with Emerging Global Trends

The researchers sought to ascertain the extent to which LJISR articles conform to emerging global trends in the area of Library and Information science research. This study is important for assessing the relevance of LJISR articles to current international LIS discourse and its potential contribution to global discourse while addressing Nigeria-specific issues. Table 6 shows the outcome of the analysis.

Table 6: Alignment of LJISR Articles with Emerging Global LIS Trends (2023–2025)

Rank	Global LIS trend area	No. of LJISR articles aligned	Percentage
1	Digital transformation and digital access	14	20.0%

2	Artificial intelligence and emerging technologies	13	18.6%
3	Open science, scholarly communication and research support	8	11.4%
4	Information literacy, misinformation and trust	8	11.4%
5	Workforce skills, professional competencies and job performance	6	8.6%
6	Health information and social well-being	6	8.6%
7	User experience, engagement and service innovation	5	7.1%
8	Records, archives and documentation	4	5.7%
9	Equity, inclusion and community engagement	3	4.3%
10	Sustainability, climate and disaster resilience	3	4.3%
	Total	**70**	**100%**

Table 6 examines the extent to which LJISR articles align with emerging global trends in Library and Information Science. The strongest area of alignment is **digital transformation and digital access,** with 14 articles representing 20.0%. This is followed by **artificial intelligence and emerging technologies**, with 13 articles representing 18.6%. These two areas show very high percentage of articles published in LJISR align with global LIS trends. The least research areas that does not align with global trend was recorded in **equity, inclusion and community engagement** and **sustainability, climate and disaster resilience,** each with 3 articles representing 4.3%.

Discussions of Findings

The findings in table 2 clearly reveals that LJISR reflects the current technological transformation within the field of Library and Information Science. Evidently, Nigerian LIS scholars are responding to the digital information environment because they have written strong articles on digital resources, library systems, artificial intelligence, automation and emerging technologies. This finding supports Chen et al. (2018) who observed that that LIS research has shifted away from conventional cataloguing and classification, and target instead digital transformation, big data, artificial intelligence and technology-based information service. It also agrees with IFLA (2024), which identified artificial intelligence, digital inclusion, misinformation, data ethics and digital access as major trends shaping the future of LIS research.

However, the relative low representation of themes such as environmental information, climate change, disaster management, inclusion and community development suggests that researchers submitting their articles to the journal underexplore these areas. This means although LJISR is strong in more scholarship that is technology-related, it should also have open submissions for more articles that discuss climate information services, indigenous knowledge systems, inclusive librarianship, disability access, community informatics, data ethics and misinformation

The data in table 3 clearly indicate that LJISR articles are heavily dominated by survey research, particularly descriptive survey design. This suggests that most contributors rely on questionnaires and quantitative description to examine issues related to library users, information resources, digital tools, staff competencies and service delivery. This pattern is not unusual in LIS research. Chu (2015) and Hider and Pymm (2008) observed that survey research is one of the most frequently used methods in Library and Information Science because many LIS studies focus on users, institutions, services, attitudes, awareness and patterns of use. The implication of this finding is that LJISR has a strong empirical orientation, but the methodological diversity of the journal is still limited. Heavy dependence on survey design may restrict the depth of interpretation, especially for complex issues such as artificial intelligence ethics, user experience, information behaviour, institutional culture and digital inclusion. This finding supports Järvelin and Vakkari (1993), who noted that empirical research has remained central to LIS, but it also reinforces Chu's (2015) argument that LIS research needs greater methodological variety to reflect the maturity and complexity of the discipline.

Table 4 reveals that LJISR article is dominated by collaborative authorship. Multiple authored articles account for 52 out of 70 articles, representing 74.3%. The dominance of two-author articles suggests that collaboration in the journal is active but mostly occurs in small research teams. This finding supports Heneberg and Chumanchenko (2025) and

Song et al. (2025), who observed that authorship in Library and Information Science has shifted from solo scholarship to collaborative research. It also agrees with Thavamani (2015) and Abu and Verma (2019), who found that multi-authorship has become increasingly visible in LIS journals, especially in areas such as digital libraries, bibliometrics, information behaviour and scholarly communication. Collaboration can improve research quality because authors bring different perspectives, skills and experiences to the research process. This supports Kademani et al. (2005), who argued that collaboration enhances research quality through shared ideas, critique and improved research design. However, the low proportion of articles with five or more authors suggests that large-scale interdisciplinary research teams are still limited. LJISR may therefore encourage more multi-institutional and interdisciplinary studies involving librarians, computer scientists, educationists, data scientists, health information professionals and policy experts.

Results of the study as showed in table 5 revealed collaboration within Nigerian LIS scholarship; however, it is largely domestic. This indicates the Nigerian LIS scholars are working together and building national scholarly network. The absence of international collaboration is an indication that LJISR has not yet fully connected with global research networks. This supports Martins and Joshua (2024), who observed that Nigerian LIS journals are increasingly showing evidence of collaboration, although international collaboration remains limited. Unfortunately, the absence of international collaboration may limit the journal's global visibility, citation impact, methodological diversity and exposure to wider theoretical perspectives.

A strong alignment with digital transformation (20.0%) and AI (18.6%) indicates that LJISR performs well in technology-driven changes currently reshaping Nigerian libraries. The combined 38.6 percent emphasis on technological themes positions LJISR as responsive to global trends. This supports the finding of ACRL (2024) which posits that a significant trend for academic libraries includes generative AI; AI literacy; open access and open science. The high number of articles on AI and emerging technologies demonstrates that LJISR is in complaints with the global trend. LJISR must expand the scope of its themes for coverage so as to bring research on green libraries, climate information services, inclusive library services, indigenous knowledge systems, access for disabilities, data justice, privacy, misinformation and ethical information governance.

Conclusion and Recommendations

The content analysis has provided a comprehensive evidence that Lokoja Journal of Information Science Research has demonstrated strong relevance as a platform for documenting and advancing the intellectual direction of Library and Information Science research in Nigeria. The journal covers major trends in digital transformation, new technologies, digital information literacy, scholarly communication and research support. In order to enhance its future relevance and global competitiveness, the following recommendations are made: ensure relevance and worldwide competition in the future, it is recommended that:

1. The editorial board should intentionally increase its thematic space by promoting more articles under-represented themes like climate change information services, green libraries, native knowledge systems, digital divide, misinformation, data ethics and privacy, health information literacy, and community informatics.
2. The Department of Library and Information Science, Federal University Lokoja, should begin to seek a grant for the conduct of a specialized workshop and training clinic for authors. The sessions should include advanced research paradigms, such as qualitative phenomenology; case studies; content analysis; and mixed-method research designs.
3. The editorial board should develop strategies to attract international authors and reviewers. This can be achieved through special issues, international calls for papers, collaboration with foreign LIS schools, and inclusion of international scholars in the editorial advisory board
4. Efforts must be made to facilitate inter-disciplinary and inter-professional collaboration. LIS researchers must collaborate with scholars in computer science, education, communication, health sciences, data science, artificial intelligence, archives, public administration and environmental studies.
5. The editors should think about producing themed issues in these areas to stimulate scholarship. This will help it become the leading Nigerian journal for research into the future of Library and Information Science.

Abstract

The study investigated emotional intelligence as a predictor of research productivity among medical lecturers in Federal universities in North-West Nigeria. The specific objectives of the study are to determine the degree of emotional intelligence of medical lecturers; ascertain the level of research productivity of medical lecturers; and to test null hypothesis on significant relationship between emotional intelligence and research productivity of medical lecturers in federal universities in North-West Nigeria. Correlational type of descriptive research design was employed and the target population of this study comprises 775 medical lecturers teaching in the five fully operational medical colleges in Federal Universities in North-West, Nigeria. The study applied Yamane's (1967) formula at a 0.05 margin of error, a sample size of 264 medical lecturers was used for the study through simple random sampling technique. Structured questionnaire (with four point Likert scale) was used as instrument for data collection. However, 264 copies of questionnaire were distributed to the medical lecturers out of which 209 (79.2%) were duly filled, returned and found usable for the analysis using descriptive and inferential statistics. The study revealed that medical lecturers in the surveyed federal universities demonstrated high degree of emotional intelligence, especially in self-awareness, self-regulation and empathy. Equally, the study found that medical lecturers in federal universities in North-West Nigeria demonstrated high level of research productivity. The study established that there is significant relationship between emotional intelligence and research productivity of medical lecturers in the studied Federal Universities in North-West, Nigeria. In conclusion, this study shows that medical lecturers in federal universities in North-West Nigeria possess high degree of emotional intelligence and substantial research productivity, with emotional intelligence strongly impacting their research productivity. Based on the findings of the study, it is therefore recommended that management of the studied federal universities in North-West Nigeria should promote emotional intelligence development through regular training and professional development programmes for medical lecturers. Emotional intelligence skills should be integrated into staff development and mentoring initiatives to enhance research productivity. Policy makers and federal university administrators in North-East Nigeria should consider emotional intelligence as a supportive factor in the improvement strategies for research performance.

Keywords: Emotional intelligence; Federal universities; Medical lecturers; Nigeria; Research productivity.

Introduction

Research productivity is a key metric of academic achievement and institutional effectiveness worldwide. It denotes the extent to which academic staff generates new knowledge through scholarly publications, research funding, innovations, conference presentations, supervision of postgraduate students, and other research-related endeavours. In universities, research productivity is a criterion for the promotion and professional recognition of academic staff, including medical lecturers, and is a significant factor affecting institutional ranking, prestige, funding opportunities, and contributions to national and global development.

Research productivity in medical and health sciences is crucial for improving healthcare quality, medical education, and clinical practices. Medical lecturers are expected to conduct significant research on pressing health issues such as

communicable and non-communicable diseases, maternal and child health, mental health, antimicrobial resistance, and cancer. The quantity and quality of their research outputs significantly affect their academic standing and contributions to public health improvements. However, researchers have characterised research productivity as the quantity and calibre of scholarly outputs generated by academic staff within a specified timeframe, encompassing number of published textbooks as single author, chapters in books, articles in journals, public debates and lectures, editorial work, co-authored textbooks, conference proceedings, teaching, ongoing research, supervision, community services, obtaining research grants, and curriculum development (Jaunch & Glueck, 2020).

Furthermore, personal characteristics like emotional intelligence have been recognised as significant predictors of academic achievement and research productivity. Emotional intelligence means the ability to recognise, comprehend, manage, and regulate both one's own emotions and those of others (Kannaiah & Shanthi, 2015). In the academic setting, emotional intelligence affects how educators handle work-related stress, manage research demands, cooperate with peers, address problems, and maintain motivation for long-term research objectives.

Emotional intelligence encompasses essential elements including self-awareness, self-regulation, motivation, empathy, and social skills. These competencies empower medical lecturers to navigate frustration from research setbacks, adapt to technological challenges related to electronic databases, maintain motivation during protracted research processes, and collaborate effectively in research endeavours (Rashidi *et al.*, 2023). Medical lecturers possessing elevated emotional intelligence are consequently more skillful in managing the emotional necessities of research endeavours, and sustaining a constant research output.

Therefore, it is essential to investigate the relationship between emotional intelligence and research productivity. Comprehending the relationship of these aspects is crucial within the framework of Federal Universities in North-West Nigeria, where limitations pertaining to infrastructure, training, and individual capacity may influence research results.

Statement of the Problem

Research productivity is essential for evaluating academic efficacy in medical and health sciences, directly influencing healthcare and education. Nigerian medical lecturers experience low and inconsistent research output comparative to worldwide standards, which may be attributed to diminishing publication rates and challenges in securing research grants. Their considerable teaching and administrative duties further constrain their research potentials. There is a notable scarcity of empirical studies investigating the correlation between emotional intelligence and research output among medical lecturers. Addressing this deficiency is crucial for formulating focused strategies to improve both emotional capabilities and research productivity in the medical domain.

Literature Review

Research productivity of medical lecturers is influenced by a combination of individual and institutional factors. Academics concur on its importance for scholarly advancement and institutional development; yet, there is no consensus on the primary determinants. These varied perspectives reveal deficiencies in both theory and practice, particularly within federal universities in North-West Nigeria. Popoola (2019) opined that publication output substantially affects the productivity of academic personnel. It allows medical lecturers to disseminate insights, exhibit academic research, achieve recognition for innovative thinking, and ultimately establish a reputation for knowledge in a specialised field.

Similarly, Bassey et al. (2018) noted that publication output is critically important for academic staff, making their promotions mostly contingent upon it. The aforementioned indicates that publication output significantly impacts the career advancement of medical lecturers and garners both local and international attention for academic institutions. This attention may manifest in cash grants, partnerships, and research collaborations. Popoola (2019) asserted that the publication output of medical lecturers can be quantified by tallying the number of journal articles, technical reports, conference papers, books, or book chapters published over a specified timeframe. The predominant methods for assessing research productivity entail quantifying the number of published journal articles.

Emotional intelligence on the other hand, it involves managing moods and emotions in the workplace to achieve desired performance levels (Kamel *et al.,* 2022). Medical lecturers, as professionals, must develop strategies to effectively manage their emotions in both teaching and clinical settings. In the view of Davoudi *et al. (*2020), emotional intelligence is about effectively dealing with emotions and emotional issues, expressing them appropriately, and working together toward common goals. In addition to that, emotional intelligence, therefore, involves understanding one's own and others' feelings and emotions, as well as the ability to regulate emotions and engage in emotional reasoning. EI, according to Ahsan (2023), is the ability to perceive and understand personal feelings and those of others. It encompasses self-awareness, empathy, self-regulation, motivation, and social skills.

Emotional intelligence in this study refers to as a medical lecturer's ability to recognize and manage their emotions, affecting their research-related thoughts, behaviors, and decisions. There are varying viewpoints on the relationship between emotional intelligence and the research productivity of lecturers, especially its connection to positive results like improved academic performance, supportive learning environments, and increased psychological well-being for educators and students.

However, scholars like Suleman *et al.* (2019) have found that there is a positive effect between emotional intelligence and academic as well as professional success. This indicates that there can be a positive effect between emotional

intelligence and the research productivity of medical lecturers at Federal Universities in the North-West. Researchers found a positive correlation between emotional intelligence and academic achievement (Aithal *et al.* 2016, Ibrahim *et al.* 2017, Moslehi *et al*. 2015, Wijekoon *et al.* 2017). The present study investigated the relationship between emotional intelligence and the research productivity of medical lecturers in Federal Universities in the North-West of Nigeria.

Objectives of the Study

The main objective of this study is to investigate the emotional intelligence as a predictor of research productivity among medical lecturers in federal universities in North-West Nigeria. The specific objectives are to:

1. determine the degree of medical lecturers emotional intelligence in Federal Universities in North-West, Nigeria;

2. ascertain the level of research productivity among medical lecturers in Federal Universities in the universities under study; and

3. determine the relationship between emotional intelligence and research productivity of medical lecturers in Federal Universities in North-West, Nigeria.

Methodology

In an attempt to achieve the objectives of this study, a quantitative research approach was adopted. Correlational type of descriptive research design was employed and the target population of this study comprises 775 medical lecturers teaching in the five fully operational medical colleges in Federal Universities in North-West, Nigeria. The study applied Yamane's (1967) formula at a 0.05 margin of error, a sample size of 264 medical lecturers was used for the study through simple random sampling technique. Structured questionnaire (with four point Likert scale) was used as instrument for data collection. However, 264 copies of questionnaire were distributed to the medical lecturers out of which 209 (79.2%) were duly filled, returned and found usable for the analysis using descriptive and inferential statistics.

Data Presentation and Analysis

Emotional Intelligence among Medical Lecturers

To ascertain the medical lecturers emotional intelligence of electronic databases for research productivity in Federal Universities in North-West, Nigeria is the response to this objective. Fifteen items were assessed. The views of the medical lecturers were sought on the items concerning the objective. The decision was based on a benchmark mean of 3.18. Their responses are attained in mean and standard deviations as well as complete information were also provided in Table 1

Table 1: Medical Lecturers' Emotional Intelligence in Federal Universities in North-West, Nigeria

S/N	Statements	SA 4		A 3		D 2		SD 1		FX	X	SD	Decision
		F	%	F	%	F	%	F	%				
1	I am aware of my strength and weakness for research productivity	101	48.3	98	46.9	8	3.8	2	1.0	716	3.42	0.615	High
2	Time spent on electronic databases has helped my research productivity	60	28.7	48	22.9	82	39.2	19	9.1	567	2.71	0.748	Low
3	My level of recognition, feelings and emotions affect others at both academic and clinical settings has helped my research productivity	76	36.4	102	48.8	24	11.5	7	3.3	665	3.18	0.763	High
4	I believe self-regulation enhances my research productivity	97	46.4	101	48.3	7	3.3	4	1.9	709	3.39	0.653	High
5	Self-regulation effectively meet my demand for research productivity	117	56.0	69	33.0	19	9.1	4	1.9	717	3.43	0.678	High

6	My level of sensation, attitudes and feelings of others has helped my research productivity	98	46.8	35	16.7	47	22.5	29	13.9	620	2.96	0.665	Low
7	I feel encouraged to continue working on research even when I face setback	84	40.2	82	39.2	36	17.2	7	3.3	661	3.16	0.828	Low
8	I maintain a positive attitude during the research process regardless of difficulties	99	47.4	85	40.7	14	6.7	11	5.3	690	3.30	0.724	High
9	My ability to always create time to mentor colleagues has helped my research productivity	104	49.8	83	39.7	13	6.2	9	4.3	700	3.34	0.783	High
10	I find that electronic databases anticipate and provide relevant information resources on my research queries	119	56.9	72	34.4	13	6.2	5	2.4	723	3.45	0.720	High
11	I satisfied with the responsiveness of electronic databases on issues encountered during research	78	37.3	24	11.5	85	40.7	22	10.5	576	2.75	0.670	Low
12	I understand the emotions of my colleagues when we collaborate on research project	93	44.5	85	40.7	26	12.4	5	2.4	684	3.27	0.758	High
13	Interactive features of electronic databases enhance my research productivity	98	46.9	86	41.1	23	11.0	2	1.0	698	3.33	0.710	High
14	Electronic databases facilitate collaboration with other researchers through communication tools	80	38.3	77	36.8	31	14.8	21	10.0	634	3.03	0.757	Low
15	My relationship with a wide circle of individuals including medical librarians has helped my electronic resources collection development	69	33.3	83	39.7	43	20.6	14	6.7	625	2.99	0.699	Low
	Weighted Mean										**3.18**	**0.865**	

Key: SA= Strongly Agree, A= Agree, D= Disagree, SD= Strongly Disagree, N= 209 number of retrieved questionnaire, X= Mean, SD= Standard Deviation. Decision - Weighted average 47.7/15 (Weighted mean=3.18)

Table 1 revealed that out of the fifteen items listed on Medical lecturers emotional intelligence in Federal Universities in North-West, Nigeria; nine items produced mean scores which were above the weighted mean of 3.18 and S.D of 0.865. These items include item 1: I am aware of my strength and weakness for research productivity ($\bar{x}$ =3.42; SD =0.615), item 3: My level of recognition, feelings and emotions affect others at both academic and clinical settings has helped my research productivity ($\bar{x}$ =3.18; SD =0.763), item 4: I believe self-regulation enhances my research productivity ($\bar{x}$ =3.39; SD =0.653), item 5: Self-regulation on electronic databases effectively meet my demand for research productivity ($\bar{x}$ =3.43; SD =0.678), item 8: I maintain a positive attitude during the research process regardless of difficulties ($\bar{x}$ =3.30; SD =0.724), Item 9: My ability to always create time to mentor colleagues has helped my research productivity ($\bar{x}$ =3.34; SD =0.783), item 10: I find that electronic databases anticipate and provide relevant information resources on my research queries ($\bar{x}$ =3.45; SD =0.720), item 12: I understand the emotions of my colleagues when we collaborate on research project ($\bar{x}$ =3.27; SD =0.758), and item 13: Interactive features of electronic databases enhance my research productivity ($\bar{x}$ =3.33; SD =0.710).

On the other hand, six items produced low mean scores which were below the weighted mean of 3.18 and S.D of 0.865. These items include items 2,6,7,11,14 and 15. Hence, there is low level on awareness of time spent on electronic databases has helped my research productivity, low level of sensation, attitudes and feelings of others, low level on feeling encouraged to continue working on research even when they face setback, low level of satisfaction with the responsiveness of electronic databases on issues encountered during research, low level on understanding the emotions of their colleagues when collaboration on research project, and low level on their relationship with a wide circle of individuals including medical librarians has helped electronic resources collection development.

Furthermore, this study finding revealed that out of the fifteen items listed, nine items produced mean scores which were above the average decision benchmark of 3.18 and S.D of 0.865, and only six items listed produced low mean scores which were below the average decision benchmark of 3.18 and S.D of 0.865 this is an indication that medical lecturers in the surveyed federal universities demonstrated a high degree of emotional intelligence, particularly in self-awareness, self-regulation and empathy.

Level of Research Productivity among Medical Lecturers

To ascertain the level of research productivity of medical lecturers in Federal Universities in North-West, Nigeria is the response to this objective. Fifteen items were assessed. The views of the medical lecturers were sought on the items concerning the objective. The decision was based on a benchmark mean of 2.51. Their responses are attained in mean and standard deviations as well as complete information were also provided in Table 2

Table 2: Level of Research Productivity of Medical Lecturers in Federal Universities in North-West, Nigeria

S/N	Variables	16 above		11-15		6-10		1-5		FX	X	SD	Decision
		VHL		HL		LL		VLL					
	Statements	F	%	F	%	F	%	F	%				
1	Number of published textbooks as single author	33	15.8	32	15.3	15	7.2	129	61.7	387	1.85	1.251	Low
2	Number of chapters-in-book	38	18.2	37	17.7	27	12.9	107	51.2	424	2.02	1.098	Low
3	Number of articles in learned journals	97	46.4	55	26.3	25	11.9	32	15.3	635	3.03	1.001	High

15	Number of courses teaching	64	30.6	58	27.8	38	18.2	49	23.4	555	2.65	1.111	High
	Weighted Mean										**2.51**	**1.065**	

Key: VHL = Very High Level, HL = High Level, LL= Low Level, VLL = Very Low Level, N= 209 number of retrieved questionnaire, X= Mean SD= Standard Deviation. Decision - Weighted average 37.74/15 (Weighted mean=2.51)

Table 2 revealed that out of the fifteen items listed on level of research productivity of medical lecturers in Federal Universities in North-West, Nigeria; eight items produced mean scores which were above the weighted mean of 2.51 and S.D of 1.065. These items include item 3: Number of articles in learned journals ($\bar{x}$ =3.03; SD =1.001), item 5: number of co-authored textbooks ($\bar{x}$ =2.96; SD =1.160), item 7: number of supervisees ($\bar{x}$ =2.73; SD =1.324), item 8: Number of collaborative researches ($\bar{x}$ =3.03; SD =1.110), item 11: number of ongoing researches ($\bar{x}$ =2.82; SD =1.055), item 9: number of research grants ($\bar{x}$ =2.77; SD =1.184), item 13: number of community services ($\bar{x}$ =2.80; SD =1.048), item 14: number of citation index i.e. Google scholar, Scopus, EBSCOhost, Web of science etc. ($\bar{x}$ =2.99; SD =1.171), and item 15: number of courses taught ($\bar{x}$ =2.65; SD =1.111).

On the other hand, six items produced low mean scores which were below weighted mean of 2.51 and S.D of 1.065. These items include items 1,2,4,6,9,10 and 12. Hence, there is low level on number of published textbooks as single author, low level on number of chapters-in-book, low level on number of editorial works, low level on number of papers published in conference proceedings, low level on number of research grants obtained, low level on number of curriculum development, and low level on number of technical reports.

However, this study finding revealed that out of the fifteen items listed, eight items produced mean scores which were above the average decision benchmark of 2.51 and S.D of 1.065, and seven items listed produced low mean scores which were below the average decision benchmark of 2.51 and S.D of 1.065, this shows that medical lecturers demonstrate reasonable strength in core academic and collaborative research activities with notable weaknesses in grant acquisition. The overall finding indicates a moderate to high level of research productivity among medical lecturers in Federal Universities in North-West Nigeria.

Relationship between Emotional Intelligence and Research Productivity among Medical Lecturers

Ascertain if there is any relationship between emotional intelligence and research productivity among medical lecturers in Federal Universities in North-West, Nigeria.

To test the hypothesis and analyze the data, Pearson Product Moment Correlation (PPMC) was used. A correlation test was carried out by associating both medical lecturers emotional intelligence on electronic databases and research productivity of medical lecturers in Federal Universities in North-West, Nigeria. The result of the analysis is presented in the Table 3.

Table 3 Relationship between emotional intelligence on electronic databases and research productivity of medical lecturers

Variables	Mean	Std. Deviation	N	DF	R	P-value
Emotional Intelligence	50.50	6.73	209			
Research Productivity	33.64	11.22	209	207	.198**	0.004

*P<0.05 is significant, DF: degree of Freedom; **R= correlation*

The result presented in the table 3 indicates the relationship between emotional intelligence on electronic databases and research productivity of medical lecturers. The relationship was found to be significant with (r = 0.198, Df =207, P = 0.004 i.e less than 0.05). This implies that there is significant relationship between emotional intelligence on electronic databases and research productivity of medical lecturers in Federal Universities in North-West, Nigeria.

Discussion of Findings

The findings indicated that medical lecturers in the surveyed federal universities demonstrated a high degree of emotional intelligence particularly in self-awareness, self-regulation and empathy. The emotional competencies have positively influenced research productivity by improving motivation, interpersonal relationships, and resilience in addressing academic challenges. Their capability to regulate emotions, demonstrate empathy, and maintain focus on

long-term research objectives has been advantageous in academic and clinical settings. The findings highlight the necessity for focused strategies to improve the emotional and collaborative skills of medical lecturers.

This study is in line with the study findings of Tegegnea and Wondimua (2024) that the instructors had high levels of emotional intelligence and effective communication but low levels of organisational commitment. There were significant positive correlations among these variables. Effective communication partially mediated the relationship between emotional intelligence and organisational commitment. It was the strongest predictor of organisational commitment, followed by emotional intelligence. This study concurs with Agyemang *et al.* (2021) in asserting that high emotional intelligence enhances stress management, facilitates effective collaboration, and promotes persistence in academic tasks, all of which are critical for sustained research output. Researchers with high emotional intelligence tend to engage with electronic databases in a patient, strategic, and adaptable manner, particularly when faced with access limitations or technical challenges (Eziagu *et al*., 2022).

This study found that medical lecturers in federal universities in North-West Nigeria demonstrate a high level of research productivity in the areas of number of chapters-in-book, number of co-authored textbooks, number of supervisees, number of research grants, number of ongoing researches, number of community services, number of citation index i.e. Google scholar, Scopus, EBSCOhost, Web of science etc., and number of courses taught.

The findings support Udo and Asuquo's (2020) assertion that significant engagement with co-authored works and research supervision is particularly notable, indicating robust collaborative relationships and a persistent dedication to academic mentoring and capacity development. Similarly, this finding aligns with Bassey et al. (2018), indicating that universities create an environment conducive to research-oriented activities, provide academic staff with equitable opportunities for research, and enhance government funding to support university research initiatives. This study finding is contrary to the findings of Bai (2022), that the research productivity of 182 Chinese academics teaching English as a foreign language from 2014 to 2018 was relatively low, particularly in terms of the quality of their research. Accordingly, the researcher synthesised the findings from the study and presented a framework for Chinese institutions and teaching English as some foreign language departments to enhance their teaching English as a foreign language academics' research capacity.

On the relationship between emotional intelligence and research productivity among medical lecturers in Federal Universities in North-West, Nigeria, the result indicated that emotional intelligence and research productivity have significant relationship. This could be due to the ability of emotionally intelligent lecturers to mitigate technology-induced stress, sustain motivation, and employ proficient problem-solving abilities. This study finding corroborated with the submission of Tegegnea and Wondimua (2024) that identified substantial positive correlations between emotional intelligence and organisational commitment among university professors, with emotional intelligence serving as a robust predictor of professional results.

It is also in line with Al-Oweidat *et al.,* (2023) who found out that there was a substantial positive correlation between emotional intelligence and organisational commitment among nurses in Jordanian government hospitals, suggesting that individuals with elevated emotional intelligence exhibit superior work performance and engagement. Similarly, Seif *et al.* (2023) demonstrated that critical aspects of emotional intelligence, specifically emotion regulation and emotion utilisation, were significantly correlated with enhanced academic performance in medical students.

Conclusion and Recommendations

Medical lecturers in the surveyed federal universities demonstrated a high degree of emotional intelligence especially in the areas of self-awareness, self-regulation, and empathy. These emotional competencies seem to positively impact research productivity by promoting intrinsic ambition, reinforcing interpersonal relationships, and improving resilience against academic obstacles. The capacity to adeptly manage emotions, exhibit sympathetic comprehension, and maintain concentration on long-term research objectives represents a notable positive correlation existed between emotional intelligence and research productivity.

Based on the findings of this study, the following recommendations were drawn:

1. University management of the studied federal universities in North-West Nigeria should promote emotional intelligence development through regular training and professional development programmes for medical lecturers.
2. Emotional intelligence skills should be integrated into staff development and mentoring initiatives to enhance research productivity.
3. Policy makers and federal university administrators in North-East Nigeria should consider emotional intelligence as a supportive factor in the improvement strategies for research performance.

Empowering African Information Professionals through Cooperative Librarianship and Technological Innovation for Sustainable Service Delivery

Onyam, Ijeoma Dora
University of Nigeria, Enugu Campus
dora.onyam@unn.edu.
Idoko, Nkechi Anthonia
Nnamdi Azikiwe Library, University of Nigeria, Nsukka
nkechi.idoko@unn.edu.ng

Abstract

This paper examines the intersection of technological development, innovative practices, and the future of library and information professionals with a call for cooperative librarianship in Africa. The study seeks to present a discourse on innovation and library services as a concept, discuss the rationale for innovative library practice in current dispensation; highlight on concept of co-operative librarianship with reference to digital environment; articulate the factors driving innovative library practice and co-operative librarianship, explain the factors limiting sustainable innovative and co-operative librarianship in technological driven age. This study adopts a qualitative conceptual approach, employing narrative content analysis of existing literature to generate data for the study. Discourses on innovative library services as a concept with an analysis of the technological situation in developing countries were presented; the concept of co-operative librarianship with reference to digital environment is also explained. The strategies for developing innovative leadership and enhancing innovative library practice in this digital era include possession of technology-driven skills, enhanced strategic leadership, good working conditions, formulation of innovative library policy, and willingness to adapt and adopt new technologies. The limitations to sustainable innovative library practice and co-operative librarianship include resistance to changes by library leaders cum managers, dearth of digital infrastructures that facilitate digital oriented services, shortage of digitally-trained librarians, low level of funding, the proliferation of technological devices, high cost of implementing digital-related services, etc. This paper contributes to existing literatures in innovations and technological applications in the field of librarianship. It provides a framework for further studies relating to technological applications to library practices within the context of co-operative librarianship. The paper concludes by presenting justification for cooperative librarianship in the areas of recruitment of well-trained and skilled personnel, training and re-training of library and information professionals, acquisition and provision of digital infrastructure and resources, etc.

Keywords: **Co-operative librarianship, Innovative practices, Technological development**

Introduction

The global library and information science (LIS) environment has witnessed significant transformation driven by rapid advancements in digital technologies, artificial intelligence, and networked information systems. Libraries worldwide are increasingly adopting innovative tools and collaborative frameworks to enhance service delivery, improve access to information, and meet the evolving needs of users. Within this context, cooperative librarianship encompassing resource sharing, inter-library collaboration, and joint service initiatives has become a critical mechanism for maximizing efficiency, expanding collections, and fostering innovation. In other words, the 21st century, libraries are no longer viewed solely as static repositories of books and other information resources; they are dynamic, multifaceted institutions that respond to the evolving needs of society (Isa & Hassan, 2025). The contemporary library environment is characterized by inevitable change due to pervasiveness of the application of information, technology and communication to the operation. By implication, the integration of innovative technologies into library services represent a paradigm shift in how libraries function and deliver value to their communities (Omolade, Funmilola & Peter, 2025).

However, though libraries and information centers have been using innovative technologies in providing services to satisfy the diverse information needs of their users; as well as it is acknowledged that embracing innovative technologies is essential for libraries to remain relevant and continue to meet the diverse and dynamic needs of their patrons in a rapid changing information landscape (Ogunmodede & Popoola, 2021; Ogonu & West, 2024), the situation in Africa reflects a different reality. Many libraries across the continent continue to grapple with persistent challenges such as inadequate funding, limited technological infrastructure, insufficient professional capacity, and weak policy support. These constraints have hindered the effective adoption of emerging technologies and the full implementation of cooperative practices. Consequently, a noticeable gap exists between global best practices in innovative, collaborative librarianship and the operational realities of libraries in many African countries.

To bridge this gap, there is need to effectively navigate the evolving digital landscape, libraries must adopt a proactive approach (Mohammed, Alumona, & Uzomba, 2023). Being conversant with the emerging technologies will

enable leaders and managers of the 21st century libraries to maintain active awareness of the dynamic of global political environment and apply practical solutions to their different problems to achieve organizational success (Ailakhu, 2017).

Collaboration touches every facet of librarianship. Collaboration, and its benefits focuses on several aspects generally, collaboration constitutes more than one person's involvement and interpersonal relationship to achieve more goals and success (Roy & Habib, 2024). Apparently, due to the rapid changes in information, technology, and paradigm shift in library systems and services, there is a need to explore how collaboration among libraries can support innovation, optimize limited resources, and enhance service delivery within the African context. Addressing this need will not only bridge the divide between global trends and local practice but also strengthen the capacity of libraries to contribute meaningfully to education, research, and socio-economic development.

Concept of Cooperative Librarianship

Cooperative Librarianship is not a novel idea; however, what is new is its growing adoption and integration into library services, largely due to its proven positive impact on performance and innovation. The concept itself has been defined in various ways. For example, it refers to a process in which two or more individuals or organizations work jointly to address challenges that cannot be effectively resolved independently (Ocholla, 2008). Looking ahead, collaboration is expected to become an increasingly common and significant area of focus. Cooperative librarianship will involve library-to-library collaboration in terms of sharing virtual resources (Ezeani, 2012). It has been acknowledged that collaboration does not happen by chance, therefore library and information science professionals must engage in collaborative initiatives in driving innovation and creativity in libraries (Akpom, Benson, & Enem, 2020).

Cooperation between libraries facilitates improved access and more efficient use of information by patrons (Muthu, Rameshalabu, & Baskaran, 2015). Ocholla (2008) asserts that the type of collaboration is determined by its nature and level, including cooperation between individuals, groups, departments, within departments, interdepartmental, within institutes, inter-institutional, within sectors, inter-sectoral, countries national/international or regional/interregional. Additionally, it might be professional or informal.

A fundamental idea in library and information science is library cooperation. Libraries working together and pooling resources can increase information access, service quality, and resource usage. As a long-term strategy for maintaining the growth of people and organizations, collaboration is a modern phenomenon (Roy & Habib, 2024). Librarians, information scientists, and other interested parties are paying more attention to library collaboration in the current era (Udo-Anyanwu 2020). According to Ahmed, Ullah, Khan, and Siddique (2024), collaboration enables libraries to provide users with additional optional services, such as dynamic places that promote exploration and cooperation and fulfill the library's role of preserving information in the contemporary era.

Innovative Technologies

The adoption of cutting-edge tools and applications has improved academic libraries' relevance, responsiveness, visibility, and roles within their particular user groups, according to Oduwole, Adekumirisi, and Oyedokun (2023). Keeping up with technological advancements highlights the continuous difficulties libraries encounter when utilizing digital technologies. Innovative technologies have shown the ability to expand the audience they can reach and increase accessibility in Nigerian libraries (Ezeabasili & Idahalama, 2025). Innovative technologies are those technologies used to collect, store, edit and communicate information in various format. The use of innovative technologies is a boost to the library services as they now assist many librarians to reach out to library users. Utilization of innovative technologies for effective services delivery in library is paramount in this ever-changing digital age (Ogonu & West, 2024).

The emerging information technologies are increasingly being deployed to the libraries. Many libraries are using Twitter, email, Flickr, group chats, Google plus, etc., while other libraries have developed applications that enable users to search catalogue from within Facebook (Esse, 2022). During the 21st century, multiple highly innovative technological advancement prompted libraries to completely modify their central services. However, while the integration of innovative technologies in library services holds great promise for enhancing accessibility, user engagement and covering services delivery, it is imperative to acknowledge the significant challenges and barriers that can impede this progress (Omolade, Funmilola & Peter, 2025).

Innovative Practice

The most frequent definition of innovation is a shift toward renovation, adoption, or something new and practical in the field (Muthu, Ramashalabu & Baskaram, 2015). The process of filtering, evaluating, modifying, funding, developing, and detailing ideas before implementing or commercializing them is known as innovation. According to Ogunmodede and Popoola (2021), innovation is the process of bringing about a change in the way libraries operate.

Academic libraries should not be excluded since innovation has become a globally recognized strategy for developing new concepts, goods, and services (Akanbiemu, 2017). According to Atata, Ejere, and Sam (2016), innovation is the application of novel concepts to create a new good or service. Finding a better method to do something in an organization is the goal of innovation, and its actualization calls for a few sets of behaviors. Modifying or enhancing current services or goods is another aspect of innovation. More innovation is required in our quickly evolving library environment. (Abubakar & Attahir, 2018).

Innovation in libraries refers to the introduction of new ideas into service delivery processes, with an emphasis on meaningful and relevant practices that can drive positive transformation within the library system. It involves adopting fresh approaches that enhance how services are designed and delivered. In the context of library management, innovation encompasses the development and application of new concepts, methods, or technologies intended to improve service quality, increase operational efficiency, and enhance overall user satisfaction.

Innovative libraries and the use of digital tools facilitate access to services, excite and educate users, and aid in the acquisition of new skills (Kalu & Ochepa, 2021). According to Sodipe, Amalahu, Uthman, and Safiriyu (2024), innovative library services combine programs that are modified to better meet the needs of users, new programs made possible by evolving digital technology, and new services that promote change in research, teaching, and learning. Although innovative services seem to be organization-centered, innovative practices seem to be personal-centered. Innovative services and practices are channels through which transformation occurs in the library first (Emezie, 2018).

Innovation in libraries is geared towards changing existing order or protocol with the sole aim of meeting the needs of library patrons (Akpom, Benson, & Enem, 2020). Innovation is critical for libraries especially libraries in the developing countries. (Oduwole, Adekunmisi & Oyedokun, 2023).

Technological Innovation in Librarianship

Innovative technologies that improve information access, improve user experiences, and streamline operations have transformed library services globally (Ezeabasili & Idhalama, 2025). Limam and Aliyu (2023) citing African, Digitalization Maturity Report (2017) averred that today many African Countries such as South Africa, Kenya, Egypt, Nigeria, Bostswana, and Ethiopia now utilize knowledge of digital transformation and inventions to improve health, education, aviation, economy, security, industrialization, banking, and finance as well as agriculture.

Technological innovations have undeniably penetrated the field of librarianship and the impacts are enormous with higher demands on the part of library and information science practitioners. Librarians must be repositioned to become creative and innovative, not to remain in the analogue mode because that is how they started, it is not ideal in today's environment (Benson, Igbokwe & Onyam, 2020). The ongoing evaluation of technology will significantly influence library services in the coming years. As emerging technologies like artificial intelligence (AI) and big data analytics emerge, advance libraries stand to benefit in several ways, including enhanced service delivery, improved organizational efficiency, and ability to tender offerings to the changing needs of their users (Omolade, Funmilola & Peter, 2025).

Many libraries in developed countries have adopted the use of ICT in carrying out cataloguing and classification functions, and Nigerian libraries are no exception (Alabi, 2018). Some of the emerging technologies witnessed in the 21st centuries are offshoots of the advances that began in the last century. However, what we see presently is a growth of technology on a grander scale and development at a very rapid rate. (Ezeani, 2013). According to Benson, Igbokwe & Onyam (2020), the world has undergone various stages of transformation from the time of creation. Notably, the global world today is under the full control of technologies. The insatiable nature of man and the ultimate desire to improve on existing developmental trends have contributed significantly to technological development globally.

Technological improvements are reflected in socially significant events and conditions (Deja, Rak & Bell 2021). All technologies used for network-based control and monitoring functions, broadcast, media, intelligent building management systems, audiovisual, processing, and transmission systems are considered innovative technologies, according to Ogunmodede and Popoola (2021). Emerging technologies present librarians with a special chance to greatly enhance user-centered services to enthrall and promote cooperation between libraries and their clients, Kalu and Ochepa (2021). Globally, the delivery of library services has significantly improved; thanks to the use of cutting-edge technologies. The opinions of Nigerian librarians about the uptake and application of these technologies, however, are unknown (Ezeabasili & Idhalama, 2025).

Cooperative Librarianship in Digital Environment

The digital environment is characterized by the application of digital technologies to the information processing and distribution chain. More so, what is expected of the libraries in this new environment is to begin to go into the analysis of the needs of users with a view to understanding them and providing resources to satisfy them (Ugwu, 2013). The propagation of information technologies has made a major effect on libraries in the way they deliver their services and content, as well as the arrangement of that very content, especially in the advanced nations where most libraries are moving towards digital collections or at the very slightest hybrid print, and digital collections. (Ogunmodede & Popoola, 2021). It is clear that digital libraries promise an exciting new service paradigm for the library community in the digital environment (Khan, 2016).

We live in a society where most people assess information through advanced technology rather than using the library, so librarians need to dance to the tone of this present generation by adopting technological innovations in their information services delivery (Ezeabalisi & Idhalama, 2025). Libraries play a crucial role in enhancing effective services to users in the digital age and addressing the challenges it present. Thus, the digital environment has compelled libraries to shift from custodial models of information management to participatory and user-centered systems of service delivery (Olatoye & Olaninhun, 2025). They are instrumental to bridging digital divide by providing equitable access to

technology and digital resources. (Mohammmed, Alumona & Uzoegbu, 2025). And to achieve this, library collaboration becomes a necessity.

Collaboration is crucial for fostering innovation, and sharing solutions in library services. As libraries face innovation challenges, collaboration networks can create opportunities for knowledge exchange, and resource sharing. (Omolade, Funmilola & Peter 2025). Library collaboration is a crucial thing that needs to be paid attention to by libraries and other information centres and institutions (Ahmed, Ullah, Khan & Siddique, 2024).

In the 21st century, librarians need to embrace change since change is the only thing that is constant by creating new services and improve on existing ones (Abubakar & Altahir, 2018). One of such change is library cooperation. Libraries need to embrace Library Cooperation, as it will go a long way in helping them render quality library services to library patrons (Udo-Anyanwu, 2020). Collaboration is essential to the advancement of library and information science (LIS) as a science and a profession (Roy & Habib, 2024). According to Omalade, Funmilola and Peter (2025), collaborative efforts among libraries and partnerships with technology providers can facilitate invention and knowledge sharing, ensuring that libraries remain vital community hubs.

Rationale for Innovative Library Practice in Current Dispensation

The use of innovation in libraries is all about introducing new concepts, practices, and information that have the potential to influence persistence and change in libraries. Applying both creativity and innovation to library operations will aid librarians in their pursuit of knowledge creation, if innovation is the application of creativity (Ogunmodede & Popoola, 2021). They have to innovate in line with the applications of emerging technologies. Innovativeness of libraries and LIS professionals is inevitable to facilitate interactive skills, multimedia tools, rich user-driven products and services enhancement of routines, tasks, and products that meets users' needs (Oduwole, Adekunmisi & Onyedokun, 2023).

In an era characterized by developing technology, the development of innovative products and services is crucial to enabling effective and efficient service delivery. Additionally, innovation improves professional training, reference services, career advancement, mentorship, and educational development for library staff in the contemporary media environment while also enabling academic libraries to better respond to the changing needs of users (Oduwole, Adekunmisi & Oyedokun, 2023).

Library and Information Science professionals are not only having to adapt to change in library services but also require in-depth and structured education and training programmes for occupation engagements in all library spheres (Benson, Obichere, Ike & Onwuzurike, 2022). According to Osuchukwu, Otubelu, Ogbonna & Ndukwe (2015), the fact remains that every library and librarian is in a continual stage of development for sustainability. To sustain this notion, accessing opportunities for collaboration, must become critical and be embraced by proactive librarians. As noted by Benson, Obichere, Ike & Onwuzurike (2022), the level of innovative and creative skills among library and information professionals is still very low.

The advent of ICT heralded the emergence of electronic information resources and services which has become an indispensable source of information for university libraries (Mohammed, 2017). As pointed out by Ezeani (2013) in our fast-changing world, the library is often seen as a place where every form of information inevitably circulates. However, libraries do not function in isolation; there is a strong need for libraries to operate collaboratively.

Factors Driving Innovative Library Practice and Cooperative Librarianship

Several factors have been identified as driving force for innovative library practices, these include:

a. *The desire to catch up with new trends*: Libraries of all types are on the move to catch up with the trend of producing ICT-related information services (Benson, Obichere, Ike & Onwuzuruike, 2022). Mobile applications and technology have changed the way one connects and interacts with the world and mobile library services can meet people's needs for information in a fast-paced society.

b. *Innovative Leadership:* The place of innovative leaders cannot be undermined in this digital age. When libraries are managed by innovative leaders, it becomes easier for the followers to tow the parts of innovative and creative culture (Akpom, Benson & Enem, 2020). Leadership behaviour in the 21st-century academic library behoves the leader to synthesize different leadership styles to influence colleagues and subordinates to produce creative ideas, products, services, and solutions (Esse, 2022). Leadership is all about making a difference in the lives of others; it is about collaborating with others to enable them fulfill their ambition; it is about stimulating creativity, and bringing out the best in others (Ailakhu, 2017). This includes strategic planning, investment in technology, prioritization of user training and a commitment to user-centered innovation (Mohammed, Alumona & Uzoma, 2025).

c. *Emergency of technology:* The emergence of Information Technology has brought a paradigm shift for libraries, for enhancing access, research and communication, thus becoming a very useful tool in fulfilling the mission to support teaching, learning, and research (Kalu & Ochepa, 2021). Owing to this, information services are experiencing significant changes and undergo substantial transformation (Ullah, Usman & Khan, 2023).

d. *Collaborative technologies:* Collaborative technologies include social media, cloud technologies, video conferencing, and email. (Okwu & Nsirim, 2025). Collaborative technologies provide opportunities where people could

collectively engage in research by sharing rich information resources, people come to meet, find information resources, and discuss common interest. (Okwu & Nsirim, 2025).

Limitations to Sustainable Innovative Library Practices, and Cooperative Librarianship

There are several factors that limit sustainable innovative library practices and cooperative librarianship. These include:

a. *Dearth of digital infrastructure that facilitates digital oriented services:* A shortage of digital infrastructure limits a library's ability to provide effective digital-oriented services. It restricts access to online resources, automation, and modern library systems. This also weakens services delivery and reduces opportunities for cooperation and resource sharing among libraries. The technology for infrastructural challenges seems to be the major barriers to the execution of innovative library services delivery.

b. *Shortage of digitally-trained librarians:* A shortage of digitally trained librarians limits the effective use of modern library technologies. It reduces the quality of digital services delivery and innovation in library operations. It also weakens cooperation, as staff lack the skills needed for efficient resource sharing and networking. Omolade, Funmilola and Peter (2025), pointed out that a significant challenge in the integration of innovative technologies is the need for effective staff training and adaptation in libraries. New library personnel must be equipped with skills and knowledge to use new tools and system proficiently.

c. *Low level of funding:* Low funding hinders adoption of modern technologies and sustainable innovative services in libraries. It also limits participation in resource sharing and collaborative networks, weakening cooperative librarianship. When librarians depend on outdated practices due to paucity of funds, both innovation and effective inter-library collaboration become difficult to achieve and sustain.

d. *High cost of implementing digital-related services:* High costs of implementing digital services limit libraries' ability to adopt modern technologies. This restricts access to digital service delivery. It also weakens collaboration through shared platforms and networks, affecting cooperative librarianship.

e. *Operating on outdated policies:* Outdated policies limit libraries' ability to adopt modern practices and respond to changing user needs. They slow innovation by restricting flexibility and integration of new technologies. As noted by Ullah, Usman & Khan (2023), obsolete library policies pertaining to rules, regulations and guidelines no longer align completely with contemporary library practices and the expectations of library users. In Nigerian context, many academic libraries are yet to implement written or observed innovative processes when compared to their counterparts in developed countries (Akanbiemu, 2017). This also hinders collaboration, as rigid policies conflict with evolving standards for cooperative librarianship.

Strategies for Developing Cooperative Librarianship and Enhancing Innovative Practice

Librarians should develop innovative leadership in order to enhance innovative library practice. Innovative library services are actualized when librarians become proactive in providing them. Library and information science professional should think outside of the box and be problem-solvers in order to remain relevant and thereby ensuring sustainable innovative library practice. Some basic strategies for developing cooperative librarianship and enhancing innovative library practice include:

a. *Enhanced strategic leadership*: Enhanced strategic leadership drive innovative by anticipating disruptions, aligning vision and resources, and building agility, while enabling forward-thinking library policies and user-centered services that position libraries as dynamic innovation hubs. According to Ailakhu (2017), the ability for librarians to effectively lead and become innovative at the same time is more critical in today's 21st-century organizations, as the work environment is becoming much more complex and dynamic.

b. *Possession of technology-driven skills*: To keep pace with current development, librarians are expected to possess skills required at every point of technological development or knowledge advancement (Benson, Amaechi & Onuoha, 2017). In other words, as librarians move from one stage of information evolution to another, acquisition of skills and expertise to match the demands of such evolving stages becomes paramount. The acquisition of new skills is a must in this new dispensation. The advances in technology no doubt have brought about changes in the skills needed for functional operations in the new era (Benson, Igbokwe & Onyam, 2020).

c. *Good working conditions:* Provision of conducive working environment that foster self-development by heads of libraries is a necessity and should be strongly recommended (Benson, Amaechi & Onuoha, 2017).

d. *Formulation of innovative library policy:* Formulation of innovative library policy is a strategic approach that integrates emerging technologies, user-centered design and inclusive access in modern library services. A well-articulated policy is a necessity in the actualization of any goals or objectives (Benson, Igbokwe & Onyam, 2020). This borders on the premise that innovative policies are important for supporting cooperative librarianship. Effective policy formulation fosters innovation by aligning institutional goals with technological advancements that transform libraries into dynamic, future-ready information hubs.

e. *Willingness to adapt and adopt new technologies:* Willingness to adapt and adopt new technologies is a powerful strategy for developing innovative librarianship, as it enables librarians to model experimentation, foster a culture of

continuous learning, and empower teams to solve complex problems creatively while turning technological change into opportunities for growth. Librarians who embrace this approach build agile, resilient organizations that remain relevant and deliver greater value in a rapidly evolving digital era.

Conclusion

This paper has shown that cooperative librarianship, supported by technological innovation, is essential for modern library service delivery. As the digital environment continues to reshape information access and use, libraries must move from isolated operations to collaborative, technology-driven practices. Despite challenges such as inadequate funding, limited infrastructure, and skill gaps, cooperation among libraries offers a practical solution through resource sharing, capacity building, and collective innovation.

In conclusion, strengthening collaborative networks and embracing emerging technologies will enable libraries to remain relevant, resilient, and responsive to the evolving information needs of their users.

Abstract

In the 21st Century, libraries have transformed from traditional repositories of books and information into vibrant hubs for knowledge dissemination, innovation, and community engagement. This evolution demands that librarians and information service professionals acquire the necessary skills, tools, and strategies to deliver innovative library services tailored to the complex and diverse needs of users. The shifting landscape of information user needs has led to the integration of emerging technologies such as artificial intelligence, digital repositories, and virtual reference services to enhance access to information. This paper explores the evolving role of libraries in the 21st Century, emphasizing the integration of advanced technologies such as Artificial Intelligence (AI), big data, cloud computing, and virtual reality to enhance service delivery. The study highlights the critical competencies required by Nigerian librarians to meet these changing demands, including technological proficiency, digital literacy, project management, and cultural competence. It identified key challenges faced by Nigerian libraries, such as inadequate funding, outdated infrastructure, and limited professional development opportunities. The study proposes strategies such as curriculum reforms in library science education, regular training on emerging technologies, mentorship programs, and partnerships with technology companies and academic institutions. Furthermore, the study advocates for institutional support mechanisms, including increased funding, policy advocacy, infrastructure development, and performance metrics. The study further presents innovative approaches to library services in Nigeria, such as the development of digital repositories, deployment of mobile libraries to underserved areas, virtual reference services, and community engagement programs to foster literacy and lifelong learning. The study concludes that addressing skill gaps, fostering continuous learning, and aligning training programs with individual roles will help Nigerian librarians navigate the complexities of the digital age thus, remaining relevant in the 21st century.

Keywords: Digital Transformation, Emerging Technologies, Innovative Library Services, Professional Development, Skills Development, User-Centered Services.

Introduction

The rapid advancements in technology and the ever-growing demand for innovative services are reshaping library and information services globally. Libraries, once seen as static repositories of books and documents, are now evolving into dynamic hubs for knowledge creation, digital access, and community engagement. As noted by Dongare, (2023), the rapid development of internet applications, the explosion in the quantity and quality of information resources, and the applications of information and technology (IT) in the field of information have forced libraries to accept and adopt new techniques for the organisation, retrieval, and dissemination of information. In Nigeria, this transformation is particularly significant, as libraries play a crucial role in bridging the digital divide, fostering literacy, and supporting lifelong learning. However, the ability of libraries to meet these changing demands hinges on the capacity of librarians and information service professionals to adapt, innovate, and lead. As such, equipping these professionals with the necessary skills, tools, and knowledge is imperative for ensuring the delivery of cutting-edge library services in the 21st Century.

The 21st Century has been characterized by a proliferation of digital technologies that have revolutionised how information is accessed, stored, and disseminated. From Artificial Intelligence (AI) and big data to cloud computing and virtual reality, these technologies offer immense potential for enhancing library services. For instance, AI-powered tools can assist librarians in automating routine tasks such as cataloging and indexing, while improving user experience through personalized recommendations (Smith & Johnson, 2022; Hussain, 2023). Similarly, digital platforms enable libraries to extend their reach beyond physical boundaries, providing remote access to resources for users in underserved or rural areas (Ogunniyi et al., 2022). However, leveraging these innovations requires a workforce that is not only technologically proficient but also adept at integrating these tools into library operations.

In Nigeria, the need for skilled librarians is further underscored by the country's unique socio-economic challenges. With a population of over 200 million people and significant disparities in access to education and technology, libraries serve as critical institutions for promoting equity and inclusion (Ayandokun & Okechukwu, 2022, Igbinovia, & Aiyebelehin 2023). Yet, many Nigerian libraries face persistent challenges such as inadequate funding, outdated infrastructure, and limited professional development opportunities for staff. These issues have hindered the ability of librarians to adopt innovative practices and fully embrace their evolving roles as facilitators of knowledge in a digital age.

To address these challenges, there is an urgent need for comprehensive strategies aimed at equipping librarians with the competencies required for 21st-century library services. Training programs that focus on digital literacy, data management, and user-centered service design are essential. For example, workshops on emerging technologies such as blockchain for secure information sharing or augmented reality for interactive learning experiences can empower librarians to offer cutting-edge services (Rama & Bhatt, 2023; Chukwusa, 2022; Opele, 2023). Additionally, fostering partnerships between libraries and technology companies or academic institutions can facilitate access to resources and expertise needed for innovation.

Professional associations in Nigeria, such as the Nigerian Library Association (NLA), also have a pivotal role to play in driving this transformation. By advocating for policy reforms, organizing capacity-building initiatives, and promoting research on best practices, these associations can support the development of a robust and forward-thinking library workforce (Alawiye, et al. 2026). Moreover, integrating information science curricula into higher education programs can ensure that future librarians are equipped with the theoretical knowledge and practical skills required to navigate an increasingly complex information ecosystem.

Objectives of the study

The specific objectives of this study are to:

1. explore the role of emerging technologies such as Artificial Intelligence (AI), big data, cloud computing, and virtual reality in enhancing library and information services;
2. identify critical competencies required by Nigerian librarians and information professionals to adapt to the evolving demands of the digital age;
3. propose strategies for capacity building among library professionals in enhancing library and information services;
4. suggest innovative approaches for enhancing library services in Nigeria in the 21st Century

Methodology

The study adopted a qualitative research approach focusing on a review of existing literature, expert opinions, and case studies to provide a holistic understanding of the subject matter. The study began with an extensive literature review to contextualise the transformation of libraries from traditional repositories to dynamic hubs for knowledge creation and community engagement. Scholarly articles, books, and reports were analyzed to identify trends in library services globally and regionally, with a particular emphasis on Nigeria. The study through this research methodology employed comprehensively explored the evolving role of libraries in the 21st Century and the critical competencies required by Nigerian librarians to adapt to technological advancements and socio-economic challenges.

The Evolving Role of Libraries in the 21st Century

Libraries have transitioned from being static repositories of printed materials to dynamic hubs that foster learning, collaboration, and innovation. The advent of new technologies such as artificial intelligence (AI), big data analytics, cloud computing, and virtual reality has transformed the way libraries store, organize, and disseminate information. Moreover, libraries now serve as community spaces where users can access digital resources, participate in workshops, and engage in lifelong learning activities.

In Nigeria, this transformation is particularly significant due to the country's socio-economic diversity and rapid urbanization. Libraries are increasingly expected to address challenges such as digital illiteracy, inadequate access to information resources, and the need for localized content. For instance, Nigerian libraries have begun adopting digital repositories to preserve indigenous knowledge and cultural heritage while also integrating virtual reference services to cater to remote users (Olorundare, et al. 2022). These innovations highlight the expanding role of libraries as enablers of societal development and knowledge equity.

Critical Competencies for Librarians and Information Professionals

To thrive in this dynamic environment, Nigerian librarians must possess a range of technical, managerial, and interpersonal skills. Key competencies include:

1. Technological Proficiency: Familiarity with emerging technologies such as AI, digital archives, and data analytics is essential for managing modern library systems. For example, AI-driven tools can be used to automate cataloging processes, improve search functionalities, and analyze user behavior to tailor services (Kumar & Sheshadri, 2019).

2. Digital Literacy: Librarians must be adept at using digital tools to curate content, manage online databases, and facilitate virtual learning environments Hamad, et al. 2023). Digital literacy also involves educating users on how to navigate online platforms safely and effectively.

3. Soft Skills: Interpersonal skills such as communication, empathy, and adaptability are critical for engaging diverse user groups. Librarians must be able to understand user needs, provide personalized assistance, and foster inclusive environments.

4. Project Management: Managing innovative library projects requires skills in planning, budgeting, team coordination, and evaluation. For instance, implementing a community-based literacy program or setting up a digital repository demands effective project management.

5. Cultural Competence: Given Nigeria's diverse ethnic and linguistic composition, librarians must be equipped to deliver culturally sensitive services that resonate with local communities. This can be achieved through regular training of librarians and information professionals.

Training Frameworks for Capacity Building

Equipping librarians with these competencies requires robust training frameworks that combine formal education with continuous professional development. Some of these key strategies include:

1. Curriculum Reform: Academic institutions offering library and information science programs should update their curricula to reflect current industry trends. Courses on data analytics, digital curation, cybersecurity, and user experience design should be integrated into traditional library science programs (Ogwo, 2021). Integrating courses on data analytics, digital curation, cybersecurity, and user experience design into traditional library science programs will ensure that professionals in the field are equipped with modern, interdisciplinary skills. These areas are increasingly critical as libraries evolve into hubs of digital information and technology.

2. Workshops and Seminars: Regular workshops on emerging technologies can help librarians stay updated on industry developments. For instance, training sessions on artificial intelligence (AI) tools for cataloging can significantly enhance the efficiency and accuracy of library operations. AI-powered tools are increasingly being used to automate metadata generation, improve search capabilities, and streamline resource management (Adeleke & Omotosho 2021; Smith & Johnson, 2022). By equipping librarians with the skills to utilize such technologies, libraries can improve service delivery and adapt to the changing needs of their patrons.

3. Online Learning Platforms: E-learning platforms like Coursera and LinkedIn Learning have revolutionized professional development by offering flexible, on-demand learning opportunities. For librarians, these platforms provide an accessible way to acquire new skills and stay updated with emerging trends in the field. Institutions can enhance their workforce's skillsets by collaborating with these platforms to create tailored courses that address specific organizational needs.

4. Mentorship Programs: Pairing experienced librarians with younger professionals is a strategic approach to fostering knowledge transfer and skill-building within the library profession. This intergenerational collaboration allows seasoned librarians to share their wealth of experience, institutional knowledge, and best practices, while younger professionals contribute fresh perspectives, technological expertise, and innovative ideas. Such partnerships can bridge the gap between traditional methods and modern advancements, ensuring that libraries remain relevant and adaptive in a rapidly evolving digital age

5. Professional Associations: Organizations like the Nigerian Library Association (NLA) hold significant potential to contribute meaningfully to the advancement and professional growth of individuals within their field. By organizing conferences, they create platforms for knowledge exchange, networking, and collaboration among professionals, fostering an environment where innovative ideas can be shared and explored. Through the publication of research findings, the NLA can disseminate valuable insights and discoveries, ensuring that its members and the broader community remain informed about the latest trends, challenges, and opportunities in their domain.

Institutional Support Mechanisms for Innovative library services

To sustain innovative library services in Nigeria, institutional support is paramount. Some of the key areas to be considered in order to achieve this drive include:

1. Funding: Adequate funding serves as the backbone for the growth and modernization of libraries. It enables the acquisition of cutting-edge technologies, the upgrading of infrastructure, and the implementation of comprehensive training programs for library staff. Without sufficient financial resources, libraries may struggle to meet the evolving needs of their communities in an increasingly digital world. To address this, government agencies and private sector stakeholders need to form strategic alliances to pool resources and increase investment in library development. Public-private partnerships can help bridge funding gaps, ensuring that libraries remain relevant and capable of delivering high-quality services (IFLA, 2019).

2. Policy Advocacy: Libraries play a pivotal role in fostering education, research, and community development, yet their contributions are often overlooked in national planning. Policymakers must acknowledge the critical function of libraries in driving national development and create supportive policies to sustain and expand their operations. For

example, integrating library services into Nigeria's digital transformation agenda could amplify their visibility and societal impact. Such integration would position libraries as key players in the country's efforts to build a knowledge-based economy, enabling them to contribute to goals such as digital literacy, information access, and lifelong learning (Baro et al. 2019; Okeji et al. 2019).

3. Infrastructure Development: In today's digital age, libraries must evolve beyond traditional book repositories into dynamic hubs equipped with modern facilities. This includes high-speed internet connections for seamless online access, digital workstations that support multimedia resources, and collaborative spaces that encourage group learning and innovation. Investments in such infrastructure are crucial for libraries to deliver innovative services effectively. For instance, modernized facilities could support maker-spaces, virtual reality learning environments, and other advanced offerings that align with current educational and technological trends (ALA, 2021).

4. Partnerships: Collaborations with external organizations such as tech companies, academic institutions, and non-governmental organizations can significantly enhance a library's capacity to serve its community. These partnerships provide access to additional resources, expertise, and funding opportunities that may otherwise be unavailable. For example, teaming up with technology firms could enable libraries to integrate artificial intelligence-driven tools into their systems, improving cataloging processes or providing personalized recommendations to users.

5. Performance Metrics: To ensure continuous improvement and accountability, libraries must establish clear performance metrics that evaluate their services' effectiveness. These metrics can include user satisfaction rates, digital resource utilization statistics, community engagement levels, and even the impact of library programs on literacy rates or employment outcomes. Regularly monitoring these indicators helps libraries identify strengths and areas for improvement. This will enable them adapt their strategies to better meet user needs and for the purpose of innovation.

Innovative Approaches to Library Services in the 21st Century

To meet the evolving needs of users in Nigeria, libraries must adopt innovative approaches that leverage technology while prioritizing inclusivity and accessibility. These approaches include:

1. Digital Repositories: Creating online platforms for storing indigenous knowledge can preserve Nigeria's cultural heritage while making it accessible to global audiences (Omekwu & Nwosu, 2023). Such platforms would make Nigeria's cultural heritage accessible to global audiences. This fosters cross-cultural understanding and appreciation, allowing people from around the world to learn about Nigeria's unique traditions, values, and history. It also provides an opportunity for Nigerians in the diaspora to reconnect with their roots and heritage.

2. Mobile Libraries: Deploying mobile libraries equipped with digital resources can serve as a transformative solution to address the lack of access to information and educational materials in underserved rural communities. Traditional brick-and-mortar libraries are often limited in such areas due to logistical, financial, and infrastructural constraints. Mobile libraries, on the other hand, provide a flexible and cost-effective alternative by bringing books, digital tools, and internet access directly to these communities. Mobile libraries can foster a culture of reading and learning in areas where educational opportunities may be limited. By reaching remote locations, libraries can support students, educators, and lifelong learners who otherwise lack access to adequate learning materials. The mobility of these libraries ensures that even the most isolated communities are not left behind in the pursuit of knowledge.

3. Virtual Reference Services: The integration of online chatbots or video conferencing options into digital platforms has revolutionized the way businesses and organizations provide assistance to users. These tools enable real-time support, ensuring that users can access help regardless of their geographical location or time zone. Chatbots, powered by artificial intelligence (AI), are particularly effective in handling routine queries, providing instant responses, and operating 24/7. For instance, companies like Amazon and Microsoft have deployed AI-driven chatbots to enhance customer service and improve user satisfaction. This initiative can simulate human conversation, offering users a seamless and efficient experience (Adamopoulou & Moussiades, 2020).

On the other hand, video conferencing options take user support a step further by introducing a personal touch. Unlike chatbots, video conferencing allows for face-to-face interaction, which can be crucial in addressing complex issues or building trust with users. This method has become increasingly popular in industries like telemedicine, online education, and remote work environments. According to a study by Wang et al. (2021), video conferencing fosters a sense of connection and engagement, making it an invaluable tool for providing personalized support.

4. Community Engagement Programs: Libraries can host workshops on topics such as entrepreneurship, digital literacy, or environmental sustainability to foster community development. Entrepreneurship workshops can help aspiring business owners learn how to develop business plans, secure funding, and market their products or services. These sessions can also foster networking opportunities, enabling participants to connect with mentors and peers who share similar goals. Digital literacy workshops are equally essential in today's technology-driven world. They can teach individuals how to use computers, navigate the internet safely, or utilize software applications for personal and professional purposes (Emiri, 2017; Panda & Kaur 2024). This is particularly beneficial for bridging the digital divide and ensuring that all members of the community have access to critical technological skills.

5. Gamification: Incorporating gamification elements into library services can significantly enhance the learning experience, especially for younger users, by making it more interactive, enjoyable, and rewarding. Gamification

involves the use of game-like features such as points, badges, challenges, leaderboards, and rewards to motivate and engage participants. Libraries can integrate educational games focused on topics for instance, like Nigerian history or science into their programs. Such initiatives not only make learning fun but also foster curiosity and a sense of achievement in young learners. Additionally, these programs can serve as a bridge to introduce kids to other library resources, such as books, e-learning platforms, and workshops. Gamification can help libraries remain relevant and appealing to younger generations while supporting their intellectual growth and development. Librarian and information science professionals therefore need to adapt strategies for up-skilling in the 21st Century.

Strategies for Up-skilling the 21st -Century Library and Information Science Professionals

From time immemorial, acquiring a skill has been considered one of the most valuable traits of the human species because it elevates the skilled individual in the eyes of others. Due to the fact that processes are continually evolving and being improved, it is imperative to take proactive steps to better understand the abilities that will give us the competitive edge in providing excellent services. The measures listed below should therefore be taken into account as Library and Information Science professionals work to upgrade their skills:

a) **Identify a needed skill gap:** This strategy entails a careful assessment of the required skill gap that a library professional may require before ensuring that he/ she attains such knowledge/ skill. Once these gaps are identified, the next step is to ensure that the individual receives the necessary training, education, or resources to bridge those gaps. This approach is systematic and ensures that the professional is adequately equipped to meet the demands of their responsibilities and contribute effectively to the library's goals (Adair, et al. 2023; El-Kalash, et al. 2023).
b) **Plan carefully:** This requires mapping out a realistic plan on how best to achieve the desired success after a skill gap has been identified. Some important elements that should be considered include but are not limited to the budget, the quality of the trainer, the content of the training to be offered and the nature or kind of training to be offered (practical, theoretical, online etc.).
c) **Identify measurable outcomes:** Conducting regular assessments of workforce skills and production levels is essential, with a focus on achieving significant improvements in employee performance. By conducting regular assessments, management can identify areas where employees excel and areas that require improvement. This process ensures that workforce capabilities align with organizational goals and industry standards. The ultimate aim is to enhance employee performance significantly, which can lead to increased efficiency, higher-quality output, and overall organizational success.
d) **Attend regular training programmes:** The library and information science professionals of the 21st century need to engage themselves in a variety of training programs i.e. workshops, seminars or conferences. By so doing, it would enable them to learn new skills from experts.
e) **Acquire quality training materials:** Library and information science professionals need to lay their hands on quality training materials. Such materials would make them understand more at their convenience.
f) **Assess the skills and capabilities of a particular workforce:** Library management should forecast and ensure that they train their professional staff on what they believe would be of value to their libraries in the future.
g) **Embracing Continuous Learning:** The smart library and information science professionals of the 21st century need to develop a continuous learning mindset. In other words, such kinds of professionals don't rely on their employers to finance their up-skilling-related activities.
h) **Promote collaboration:** Facilitating collaboration among professionals fosters the exchange and integration of diverse ideas, enabling the sharing of knowledge and best practices. This approach can significantly contribute to the advancement of the library profession by encouraging innovative solutions and collective growth (Hamad et al. 2017).
i) **Align training to individuals:** To enhance the effectiveness of professional development within the library and information science profession, it is important to align training programs with the specific needs and roles of individual staff members. Tailoring the content of training sessions to address the unique responsibilities and skill requirements of different employee categories ensures a more focused and impactful learning experience. Avoid adopting a one-size-fits-all approach by delivering the same training to all employees, as this may not address the diverse needs of your team.

Conclusion

The transformation of libraries from traditional repositories to dynamic centers of knowledge, innovation, and community engagement is essential in the 21st century. The integration of advanced technologies such as AI, big data, and digital platforms offers immense opportunities to enhance library services, particularly in addressing the challenges of digital literacy and equitable access to information in Nigeria. However, the success of this transformation hinges on equipping librarians with critical competencies, including technological proficiency, digital literacy, and project management skills. To achieve this, a multi-faceted approach is necessary. This includes curriculum reforms in library science programs, regular workshops on emerging technologies, online learning opportunities, and mentorship programs. Institutional support through adequate funding, policy advocacy, infrastructure development, and strategic partnerships is also vital to sustain these advancements. Innovative approaches like digital repositories, mobile libraries,

virtual reference services, community engagement programs, and gamification can further enhance the relevance and accessibility of library services. Addressing skill gaps, fostering continuous learning, and aligning training to individual roles will position librarians to effectively adapt to the evolving demands of the digital age.

Abstract

The paper examines equipping librarians and information service professionals with digital technology skills for innovative library services in academic libraries in Nigeria. The paper is a reflective piece that focused on developing digital technology skills by librarians to deliver quality information services in academic libraries. The paper used literature review to identified various digital technology skills that would equip librarians such as social media skills, Internet skills, computer skills, digital advocacy skills, critical thinking skills, mobile technology skills and digital resources skills. The paper established that librarians and information professionals now developed skills on the use Internet of Things, social media big data to give access to the patrons and general users quality library services through cutting-edge technology. The paper concluded that training has become imperative considering the changes in digital technology which has become a cornerstone of development in modern libraries. The paper recommended that there is a need for constant, consistent and continuous training and professional development to keep the academic library achieved its mandate of teaching, learning and research development.

Keynotes: *Digital Technology, Digital Age, Librarians, Information Service, Innovation*

Introduction

The 21st century is making a remarkable strives with advancement in digital technologies which contribute significantly in all sectors of life; be it social, political, governance and economic development. Digital technologies such as robotic technology, artificial intelligence, cloud computing, big data, social media, smart phones, digital cameras, sensors and Internet of Things are contributing significantly in global information visibility and dissemination (Adamu, Muhammed, & Usman, 2021). The 21st century has equally opened opportunities for individuals, organizations, corporate bodies and nations to develop knowledge, education and research to advance globalization. The globalization and transformation of the academic libraries in the 21st century in the age of digital-modernism can be viewed through the digital turn. This means a shift from the traditional role of the library towards a role as a supplier of networked services for digital information and innovations. The mainstream strategy and activities of libraries are related to the word "digital", which comprises both digital collections and digital services (Acharya & Vagdal, 2023).

Academic libraries are related to the movement into the information society based on the profound influence of modern digital technologies and prevalence of the Internet of Things (Hussaini, 2019). In contemporary societies, progress is often measured by visible infrastructure-roads, bridges, skyscrapers and technology hubs. Yet, the 21st century recognized digital technologies as one of the most powerful engines that drives development which academic libraries, librarians and information professionals depends for professional output. Academic libraries are not just storage spaces for books; they are intellectual powerhouses that fuel education, innovation, research and social inclusion. This is because academic libraries play a critical role in preserving intellectual assets and ensuring access to information for citizens across generations and in meeting the 21st century expectations. According to Adamu, Muhammed and Usman (2021), the 21st century also value libraries as a systematic institution of collecting, organizing, and safeguarding digital technologies in various dimensions for enriching historical, valuable research, cultural records and documentations. Digital technologies in the 21st century also assist academic libraries to contribute directly to academic and research advancement. Academic libraries provide access to scholarly databases, journals, textbooks, and digital repositories. Academic libraries promote information equity. In a community where access to books, Internet and information resources are limited, the library becomes a gateway to opportunity. It reduces the knowledge gap between socioeconomic groups and ensures that learning is not restricted to those who can afford it. This equal access to information strengthens democratic participation as informed citizens are better equipped to make responsible decision. In today's digital age, libraries and librarians are evolving beyond physical collections. Many libraries now provide digital resources, online databases, data management and innovation spaces. Librarians guide users in navigating information overload, combating misinformation and applying critical thinking skills to ensure information resources are provided at the right time.

It is important for librarians to understand that the 21st century societies and users are transforming. It is needed to react flexibly to the changes in the society and to go with them, to create the library mission and role in today's information society. Librarians and information professionals need courage to stand for their values. The mission of today librarians

is to provides a barrier-free access to quality information in support of reading, research, learning, teaching, and service to the society. The notion of becoming a cultural centre is also an expansive role for the future academic libraries. It would not only serve as an information resource, but much more, with the exact mission and goals evolving and changing over time. According to Singh, (2018), the dominant factor in the development of libraries is the ongoing move towards digital distribution of information through the global network infrastructure. This paper became necessary to reflects on various ways to equipped librarians to rethink and re-strategize on use of ever-increasing technological changes to opened opportunities for librarians to deliver quality and friendly services for sustainable development that embraces advancement in digital technologies in promoting global digital services. Digital technologies in academic libraries are meant to assist librarians in bridging the prevailing information provision gaps in the teaching, learning and research needs of the users. However, gaps still exist amongst some librarians to use knowledge of electronic resources, artificial intelligence, Internet of Things, big data, and computer application software's to give access to the patrons and general users' quality library services through cutting-edge technology

Librarians and Information Professionals in the 21st Century Academic Libraries

21st century academic libraries are driven by information and communication technology, digital inclusion, the Internet of Things, big data, artificial intelligence (AI), electronic environment and digital transformation. The 21st century has transformed every aspect of library activities. The changes in digital technology are not only reflected in the activities of the library alone, but the role of academic librarians in transforming the social and technological landscape in the digital era (Einasto, 2017).

A study conducted by American Library Association (2023) highlights that 21st century enhances academic libraries to respond to the fast-changing future of libraries through creative thinking and innovation in response to the digital world. Adeleke (2023) states that 21st century digital transformation is more than the ability of librarians to acquire digital competence to use computer and other digital devices, but the ability to be creative and innovative to communicate digital resources effectively. Akinade and Akinola (2022) highlights that with the digital transformation and Web 4.0 technologies, librarians have a new, more dynamic role in the knowledge- driven society. Kumar and Rao (2014) recognize that the presence of web experience and other digital devices has created a new environment for librarians to interact with digital technology. 21st century served as a tool for collaborative, creative and recordable communicative techniques essential for librarians to communicate, collaborate and to protect digital resources. Liman (2024) states that digital transformation goes beyond the digital competence of academic librarians needed to use or operate digital technological devices, but also the ability to use digital resources effectively. Digital transformation offers potentials for academic librarians to seek for new thinking and innovations to provide library services. Thus, the importance of digital transformation cannot be over emphasized as it equips academic librarians with critical thinking and ability to evaluate, understand and interpret digital resources for effective use.

Digital transformation enables librarians to make informed use of digital technology and media as it offers an opportunity to participate in new kinds of social activities (Daniels, Wiche & Nsirim 2023). Despite digital transformation which is rapidly evolving in information explosion on changing the digital resources such as e-journals, e-books, mobile based services, institutional repositories, tutorials, multimedia content and the Internet, gaps still exist as many academic librarians still find it difficult to identify and manage digital resources to transform digital library environment.

The 21st Century Academic Librarians are requiring to be familiar with library collections for creating, searching, storage and retrieval of digital data in any medium such as text, image, sound and dynamic images Adamou (2017) argues that digital transformation has revolutionized new thinking through professional skills and knowledge in transformation of not only conventional information service delivery but transformation and innovation in hypertext links for navigation; support multimedia content along with text and network accessibility.

21st Century Academic Librarians has led librarians to develop new thinking toward transforming library automation, digital and virtual libraries, virtual conference, web-cast, pod-cast, community and online learning, Web 2.0 and library 2.0 technologies (Hamza &Makama, 2021). However, many librarians in developing countries still find it difficult to digitally transforms library collections in Purchasing/subscription of e-resources, set up the new digital services on the place of traditional print services, advocate for digital collection and services, setup the 24x7 pattern library services in networking environment, design and development of digital data repositories, implement the open educational resources platforms, develop mobile apps and mobile library websites and enhances research advocacy for effective library collections (Singh, 2019). 21st Century Academic Librarians has created innovative idea for librarians to locate, manage, organize, understand, and evaluate library services (Hussain & Ahmad, 2021). The ability to access and manage various digital technologies especially electronic databases, online reference enquiries, interlibrary loans, digitisation, and electronic publishing requires digital transformation and innovations of librarians (Abdul- Kareem, 2018).

Anyim (2018) emphasizes that one of the vital components of digital transformation is the ability of academic librarians to create, manage, search, use, store and preserve local publications and information of national and international interest accessible on a subscription or pay-per-view basis. In this sense, it is an extension and enhancement of information storage and retrieval mechanisms that manipulate digital information in any medium (i.e. text, image, sound, static or dynamic images) and exist in digital networks. However, gaps still exist as not all academic librarians has the skills and

competence to manage, search, use, store and preserve electronic version of information resources to transform the frontier of library services.

The 21st Century Academic Librarians has transforms librarians to gain digital literacy platform in digital technology, communication tools or networks to locate, evaluate and create requires creativity in multiple digital formats from a wide range of sources via Internet and other digital technologies (Singh, 2017). Presently, the impact of digital literacy on academic librarians depends digital innovation and creativity offered to access the electronic resources from anyplace at any time. Academic librarians' ability to acquire digital literacy competencies to access, communicate and use digital resources such as computers, smartphones, Internet and web tools, multi-media platforms require digital creativity. Digital literacy of librarians to make use of the OPAC catalog of the library, the e-journals, e-book and other digital material require digital creativity that facilitate searching, evaluation and retrieval of the electronic material (Ilesanmi, 2023). However, gaps still exist as not all academic librarians in Nigeria are creative and innovative to transform library services to enhance digital technology services as new digital platforms in information management and disseminations. 21st Century Academic Librarians provides robust interaction between librarians and users thereby democratizing the global dissemination of information. The United Nations Educational, Scientific and Cultural Organization's (UNESCO) (2017) "Information for All Programme" (IFAP) embodies the importance of digital transformation to access on-line connections and interaction among librarians to a worldwide network of users. The rapid development of technology has transformed the way librarians work and interact with library users. Various researches have been conducted on the ability to of librarians to transformed academic libraries with network of users across the globe through interaction (Adamou, 2017). Despite the importance of digital transformation which allows for flow of information for interaction with the use of digital resources, it appears that not all academic librarians in developing countries have the skills and competence to use digital technologies to interact for information sharing, information usage and information dissemination (Singh, 2019). Even though, digital transformation is important strategic information for librarians to interact and network the activities of the library, gaps still exist among librarians in Nigeria to digitally transform library services through interaction with the digital technologies.

Equipping Librarians and Information Service Professionals with Digital Technology Skills for Innovative Library Services in the 21st Century in Academic Libraries in Nigeria

Libraries are essential to learning, research, generation and preservation of knowledge as well as dissemination of information. Librarians are the custodian of information and knowledge in the new digital age. The 21st century librarians is an information warehouse with critical thinking abilities to impact positively on the society. Librarians as professionals are critical stakeholders in ensuring that libraries achieve their mandate. The 21st century is considered as opportunity offered by ICTs and other digital technologies that foster librarians to assume new thinking towards information service delivery. Librarians now use robots in combination with RFID technology and data of bibliographic record to give access to the patrons and general users quality library services through cutting-edge technology (Bernard, 2017). Such kind of newest technology is considered to be the part of new industrial revolutions. However, evidence from literature indicates that many librarians in Nigeria are still lagging behind in acquiring digital knowledge to advance information search, information retrieval and quality information service delivery ((Hussain & Ahmad, 2021).). In repositioning the academic libraries for effective information service delivery, there is the need for the librarians to be equipped through the following:

1. **Digital Advocacy Skills:** in the current dispensation, users no longer seek information in the libraries. The opposite has become the case where the librarians go out to render information services to users. to achieve this, the librarians have to look out for opportunities to connect and interact with various technologies. The librarians' needs be well equipped with skills to download and search online resources, use web technologies, access online information, locate and navigate uniform resource locators (URLs) and perform basic Internet search. Librarians' needs to also be equipped with basic tasks of online searching, web technology, understand and use computer hardware and software and perform basic Internet search activities due to poor digital literacy.
2. **Digital Information Resources Skills:** The21st century has opened up opportunities for librarians to develop skills in information sharing, media literacy, digital technology, learning ability, communication, digital content creation, digital identification and information and communication technology (ICT) services Horsfall, (2020) maintains that librarians require digital literacy in operating computers, ICTs and other digital facilities for personal and professional development. The American Library Association (2023) also maintains that the ability to access and successfully use digital information is central to nearly all professionals working in libraries and information centers in closing the gaps in digital access and skills. The 21st century librarians are no longer just the guardians of books; they are information providers in an environment that is constantly changing and driven by digital technology. Huynh and Do (2017) observe that many academic libraries in developed countries employ librarians who are well versed, equipped and grounded in the use of digital technology to perform their duties and participate in the digital information services.
3. **Critical Thinking Skills:** The 21st century is considered as a phenomenon offer by digital technology revolutions that foster librarians to assume new thinking towards information service delivery. Librarians and libraries now use Internet of Things (IoT), artificial intelligence, smart phones, social media, cloud computing,

robots in combination with RFID technology and data of bibliographic record to give access to the patrons and general users quality library services through cutting-edge technology (Bernard, 2017). Such kind of newest technology is considered to be the part of the 21st century revolutions. The 21st century revolution is a fusion of digital technologies that is blurring the lines between physical, virtual and digital space thereby producing smart technologies where robotic technology, artificial intelligence, big data, social media, smart phones, digital cameras, sensors and Internet of Things are contributing significantly in global information provision and dissemination.

4. **Mobile Technologies Skills:** Mobile technology is a cellular telephone with an integrated computer and other features such as Internet access, web browsing, software application, and operating system capable of downloading applications. Academic librarians require skills in mobile devices like cell phones to communicate, create, access and share information with the general public on the activities of the library. Librarians offer library services through mobile telephones with the use of Global Systems for Mobile Communication (Raju, 2014). Skills in mobile phones assists librarians to support teaching and research through the use of short message services.
5. **Social Media Skills:** Social media platforms in libraries have become an indispensable phenomenon in global information provision and dissemination. This is because in a world driven by technological advancement, there is need for academic librarians to equip themselves with the skills needed to meet the need of library users especially in the area of marketing and promotion of information products and services (Raju, 2017). Social media has become a platform that everybody, organizations and institutions cannot do without. Before the advent of social media platforms, library holdings were predominantly in print, but, the evolution in ICTs, digital technologies, digital resources in electronic formats where library collections have changed from local contents to global networks (Davis, 2016). The emergence of social media platforms has affected virtually every sphere of human endeavor as it revolutionized information communication. Social media has become an increasing familiar tool employed by librarians in academic libraries in marketing services and resources to current and prospective patrons. Social media applications offer boundless opportunities for librarians to learn while also contributing to the knowledge of others.

Challenges to Innovative Library Services in the 21st Century in Academic Libraries in Nigeria

The following are the notable challenges librarians and information service professionals encounter in delivering innovative library services:

1. **Poor knowledge of Digital Resources**: Poor knowledge of ICT infrastructure and affordable online access, absence of in- depth digital skills and information searching behaviour are challenges facing academic librarians in the 21st century. Atram (2018) identified problems facing academic librarians in Nigeria to include lack of adequate digital skills among staff and users, low information literacy levels, media and computer literacy. Poor knowledge of digital resources especially prohibitive costs in developing countries to gain access to the Internet is still frequent among academic librarians as identified by Hussain and Ahmad (2023) are invaluable research tools that complement the print-based resources in a traditional library setting.
2. **Poor Digital Literacy Skills**: the 21st century provides a platform for librarians to make use of digital resources to participate in new social and intellectual order (Hussain, 2019). However, librarians with poor digital literacy will not be able to access computers and databases which can lead to serious resentment in the delivery of information services. Being digitally literate has become a requirement for deriving maximum benefit from digitized resources without which librarians will be confronted with a wide gap in meeting with the changes of modern society in information delivery (Anunobi & Emezie, 2016). The benefit of digital literacy is to enable librarians to demonstrate ability to evaluate and use information critically from relevant and authoritative sources online (Coldwell-Nelson, 2017). Failure of academic librarians to develop digital competence poses a big challenge in achieving the goals of digital literacy in meeting contemporary society's digital revolution and information delivery.
3. **Inadequate Digital Literacy Training:** Inadequate digital training and re-training have become a huge problem affecting academic librarians in developing countries to carryout library functions in a digital environment (Raju, 2017). According to Alhassan, A. (2022)., poor digital literacy of librarians as a result of inadequate training has hindered the effective use of digital resources in academic libraries. Many academic librarians in African countries and particularly Nigeria still find it difficult to integrate digital literacy skills with the traditional method of information service delivery due to poor training (Rose, Eldridge and Chapin, 2015). Digital literacy training is important for academic librarians to understand new technologies as they emerge, to identify the opportunities in them and manage the risks (Waller, 2016). Training in digital intelligence will grow over time as the new technology evolves. Gallardo-Echenique (2015) rightly maintained that new Information and Communication Technologies such as the Internet, online gaming worlds, artificial intelligence, robotics and 3D printing are evolving through digital literacy that require the adequate training of librarians. Without adequate training in using these digital resources and services, academic librarians will be left behind in the digital age.

4. **Lack of Digital Technology Awareness:** Lack of awareness and understanding of new digital technologies such as mobile Internet access, cloud-based computing, the 'Internet of Things', digital data, artificial intelligence and an increase in computer-driven decision-making and other forms of automation have become a big challenge for librarians in recent times (UNESCO, 2017) Digital literacy evolved as a result of change that has continually taken place in a technology-driven environment. Librarians require awareness and understanding of digital technologies as well as interaction with these technologies for decision-making (Baharuddin, Izhar, Mohamad and Hasnol, 2016). Amid these changes in digital technology, academic librarians are expected to continually participate fully in digital technologies and processes. According to UNESCO (2027)), lack of digital technology awareness is still observable among librarians in developing countries in transforming digital content and technology for proper use.

Strategies for Equipping Librarians and Information Service Professionals Digital Technology Skills for Innovative Library Services in the 21st Century in Academic Libraries in Nigeria

Digital Awareness provides wider skills for academic librarians and information professionals to develop the knowledge of electronic resources, computer, database, electronic books, electronic journals, electronic dictionaries, electronic encyclopedias and other digital resources for effective library services. The academic librarians and information professionals should facilitate search for online information services, retrieve digital technologies from a variety of sources, sufficiency of digital technologies for a specific purpose, organize digital resources for information retrieval, synthesize digital technologies from a variety of sources, build digital technologies to express and support information service delivery, connect and interconnect digital technologies for delivery via a different medium (e.g., email, presentation software, word documents, and spreadsheets), understand the power of digital technologies for library operations and services, understand and being able to manage digital identities appropriately and locate, organize, understand, evaluate, analyze and present digital information.

ICT skills and competencies have become imperative that focuses on the ability of academic librarians and information professionals to develop knowledge to search for information, interpret it and evaluate its credibility and suitability, as well as the skills of using a computer and other digital devices. Handling of the ICTs requires skills and competencies in electronic resources, software applications and creating digital content. Skills in ICT Devices: ICT facilitates access to electronic information that has become invaluable and complementing traditional library services. This means that the academic librarians and information professionals' ability to use ICT and its components such as managing files, word processing, spreadsheets and databases, in bridging the gap by stating the required knowledge, skills and competencies that has not only brought a change in the working style of librarians, is also essential for them to survive

1. Operating System: This refers to academic librarians' abilities to store files, use operating systems and the desktop environment; managing and organizing files and directories/folders, simple editing tools; and print management facilities
2. Understanding digital technology and other digital devices: This means the academic librarians' ability to switch on computer and other digital technologies, such smartphones.
3. Application of ICT Hardware and Software: This signifies the abilities of academic librarians to install appropriate applications and software. The basic competences include the creation of content (example, creating files with the use of relevant options of programs, saving files), organization of the content (ordering files in folders) and browsing for content.

Conclusion

The developments in 4th industrial revolution and specifically the paradigm shift in library services with the advent of Information and Communication Technologies (ICTs), Internet services, electronic resources, digital collections and other digital technology services have led to advancement in digital revolution in libraries and among librarians (Atram, 2017). The role and position of librarians have dramatically changed (Anyim, 2018). The rapid pace of development in the field of digital technology and the advent of networked information services have prompted librarians to acquire knowledge of digital technologies to advance digital information delivery. Academic librarians now experience global trend, which is characterize with a fundamental shift from traditional information environment to an electronic environment where emphasis is placed more on digital technologies in acquisition, organization, processing and communication with the use of digital resources such as electronic books, electronic journals as well as online databases. The contemporary practice among librarians in library services in the 21st century is being propelled with an information explosion and the inclusion of digital technologies in all aspects of library services.

Way Forward

1. There is a need for constant, consistent and continuous training and professional development to keep the library alive for optimal productivity and effective utilization of the resources.
2. There is the need to equip Librarians with modern techniques and approach to enhance effective library services especially that the library is growing in both human and materials resources.

Abstract

This study investigates the equipping of librarians and information services professionals for innovative library services in the 21st century at Baze University and the National Open University of Nigeria. The specific objectives are to determine methods for equipping librarians and information services professionals to deliver innovative library services, identify innovations in library services, assess the extent to which such services are provided, and identify the challenges associated with their delivery. A survey research design was adopted for the study. The study population comprised 13 academic librarians at Baze University and 64 librarians from the National Open University of Nigeria. The census sampling technique was used. Data was collected through a structured questionnaire administered to librarians. Descriptive statistics, including mean and standard deviation, were used to analyse the research questions. Regression analysis was used to test the hypothesis. The findings revealed that innovative library services are available and that librarians employ various methods to equip themselves to deliver them. Findings indicate that librarians offer innovative services in libraries and face numerous challenges in equipping and delivering them in the 21st century. Methods of equipping significantly predict the provision of innovative library services by librarians (P = .000). The research concluded that librarians are aware of innovative library services and are preparing for them. The study recommended, among other measures, that libraries adapt and expand their innovative services to address changing user needs and remain relevant in the 21st century, and that institutions standardise training programmes and provide continuous professional development for all librarians to ensure they are well equipped.

Keywords: Librarians, information professionals, and innovative library services

Introduction

Globally, there is a shift in the provision of library and information services as a result of technological innovations. Traditional library services are giving way to digital library services. The 21st century is the millennium of emerging technologies. It is also seen as an era of an explosion in information output and sources. According to Magbadelo (2020), it marks the beginning of the knowledge age. As a result, new patterns of work and business practices have emerged, and new forms of work with distinct skill requirements are required. In this century, the meaning of knowledge has changed. Knowledge is no longer what is stored in the minds of experts, represented in books, and classified in disciplines. This is the century in which librarians operate, and to remain relevant, they must acquire the necessary skills to function effectively.

In the 21st-century library, the advent of ICT has redefined the library's role. Print materials are no longer sufficient to store information. CD-ROM databases, artificial intelligence, electronic document delivery, automated cataloguing, circulation systems, and online information retrieval (OPAC) have become the norm in librarianship, requiring skills for their use (Okoro & Shittu, 2025). Furthermore, the advent of the internet, digitisation, and remote access to library and research materials have dramatically changed how libraries provide services, thereby increasing the need for skills to deliver effective services.

Librarians are at the forefront of providing information services to respective individuals to support their teaching, learning, and research needs. Alabi and Sani (2021) argued that effective delivery of information services that meet the needs and aspirations of citizens, decision-makers, and lifelong learners is a long-standing goal of the library and information profession. Notwithstanding this, the integration of ICTs into information service delivery has transformed the way librarians provide their services. Librarians are now facilitators of round-the-clock access to information resources both within and beyond the library. Equipping librarians with the necessary skills in the current age is paramount, as without them, they cannot provide innovative library and information services.

Innovative service consists of the virtual reference services relating to chat and email service, collaborative service provision, digital common information services, digital instructional programmes for users, and staff training in

university libraries, which was reported by Okoro and Shittu (2025); they revealed that emails are increasingly supported by a Frequently Asked Questions (FAQ) database and are the preferred cost-effective means for providing university VR services. However, Etebu and Zacchaeus (2020) viewed it differently. They stated the following services: blogging services, podcasting services, electronic publishing services, online information search services, short message alert services, online training and workshops, digital reference services, database production/distribution services, online entertainment services, mobile application services, and digital marketing services. They also established attendance at conferences, seminars, and workshops as the primary strategy for promoting innovation and creativity in the library.

The advent of information and communication technologies is bringing lasting change to the library and information profession, and this change must be supported by ensuring that librarians are well-equipped with digital skills to sustain librarianship in the 21st century. Drawing on this background, this study seeks to investigate the preparation of librarians and information services professionals for innovative library services in the 21st century.

Statement of Problem

Ideally, librarians in academic libraries in Nigeria are supposed to be provided with adequate skills that will prepare them for the provision of innovative library and information services in the 21st century, such as blogging service; podcasting service; electronic publishing services; online information search service; short message alerts services; online current awareness services; online orientation services; online training and workshops; digital references services; database production/distribution services; online entertainment services; mobile application services and digital marketing service.

However, the researcher has observed that most librarians and information professionals are not well equipped to provide innovative library and information services. In the 21st century, librarians and information professionals are still providing traditional library services, which Madukoma (2021) noted is a result of a lack of support from the administration and a lack of installation of modern technologies in the library, which are the major barriers to the practice of innovative services among librarians in Nigeria. It is against this backdrop that this study seeks to investigate the equipping of librarians and information services professionals for innovative library services in the 21st century, so as to inform library management, policymakers, and stakeholders on strategies to equip librarians and information professionals for effective innovative library service delivery in Nigeria.

Objectives of the Study

The main objective of the study is to examine the equipping of librarians and information services professionals for innovative library services in the 21st century at Baze University and National Open University of Nigeria. The specific objectives are to:

1. Identify the innovative library services in the 21st century known by librarians at Baze University and the National Open University of Nigeria.
2. Determine methods of equipping librarians and information services professionals for innovative library services in the 21st century
3. Assess the extent of provision of innovative library services in the 21st century by librarians
4. Identify the challenges of innovative library services in the 21st century in the institutions under study
5. Methods of equipping librarians and information services professionals do not predict the provision of innovative library services in the 21st century

Research Questions

The study answered the following questions:

1. What are the innovative library services in the 21st century known by librarians in Baze University and the National Open University of Nigeria?
2. What are the methods of equipping librarians and information services professionals for innovative library services in the 21st century?
3. What is the extent of provision of innovative library services in the 21st century?
4. What are the challenges of innovative library services in the 21st century?
5. Do methods of equipping librarians and information services professionals predict the provision of innovative library services in the 21st century?

Hypotheses

The following hypothesis was tested at a 0.05 level of significance.

$H0_1$: Methods of equipping librarians and information services professionals do not predict the provision of innovative library services by librarians in the 21st century

Literature Review

Studies have discussed ways in which librarians can be equipped for innovative services. In this regard, Okeji et al. (2020) assessed the digital literacy skills of 21st-century librarians in private university libraries in Anambra State. A

descriptive survey design was adopted for the study. The area of the study was Anambra State, located in the South-East Geopolitical Region of Nigeria. The population of the study comprised all 23 practising librarians in the three private university libraries in Anambra State. The data collected was analysed using mean scores. 2.50 was used as the benchmark. The major findings of the study show that academic librarians sponsor themselves for training on digital literacy, they attend training twice a year, and power failure and poor internet are the challenges librarians in private universities in Anambra State face. The study was conducted in a different location, while the present study will be done in Abuja; both of the studies use the same methodology.

A lot of innovative services have been discussed in the literature, such as online current awareness services and virtual argumentative services, among others. Thus, the study of Etebu and Zacchaeus (2020) looked at innovative library services (ILS) in the Nigerian context through different ways, such as online business support service for start-ups; web design services; blogging service; podcasting service; electronic publishing services; online information search service; short message alerts services; online training and workshops; digital reference services; database production/distribution services; online entertainment services; mobile application services and digital marketing service. Data analysis was done using frequency count, percentages, the Likert scale presented in tabular format, mean, and standard deviation. Using the four-point Likert-type scale, a midpoint mean (criterion mean) of 2.5 was established and accepted as a positive response point. Inadequate funding, inadequate deployment of ICT infrastructure, and resistance to change were some of the challenges identified as hindrances to ILS. Even though the study was on innovative library services, it was limited to Bayelsa State, South-South Nigeria. While the current study is limited to two universities in Abuja.

In another study, Madukoma (2021) investigated the innovation and creativity practices among librarians in Nigeria. A survey research design was used in this study. The population comprised 165 practising librarians who attended the 2018 Nigerian Library Association Annual General Meeting held at the Olusegun Obasanjo Presidential Library, Abeokuta, Nigeria. A self-structured questionnaire was used to collect data, and a hundred per cent return rate was achieved from the participants. Descriptive statistics such as frequency count, percentage, mean, and standard deviation were used for data analysis. Major findings from the study showed that the provision of research tools and the provision of online search tools were the major types of innovation/creativity practised among librarians in Nigeria. The result also revealed that librarians always use their experience to invent new things that add value to library service. However, the study further revealed that lack of support from the administration and lack of installation of modern technologies in the library were the major hindrances to the practice of innovation/creativity among librarians in Nigeria. While both studies focus on innovation in library services, the previous study was done in Abeokuta, while the current study will be done in Abuja.

The benefits of Innovative Service Delivery (ISD) in the libraries include enhanced user experience, increased efficiency in information retrieval, and access to resources by users. Okoro and Shittu (2025) examined digital Literacy Skills and Innovative Service Delivery in University Libraries in North-West, Nigeria. A survey research design was adopted for the study. The population comprised 454 academic librarians in Federal, State, and private universities in Northwest Nigeria, with a sample size of 210. Data were analysed using descriptive and inferential statistics. Findings revealed innovative services provided include digital tutorials, library resources through social media, a digital instructional programme, online user education, and Ask a Librarian services training. The previous study was conducted in North-West, Nigeria, focusing on digital skills and innovative services, while the present study focused on innovative library services in Abuja.

Ukwuoma, Dim, and Chigbu (2021) ascertained how the incorporation of information and communication technology-driven innovation services could improve information delivery in academic libraries in Nigeria. Descriptive survey research was adopted for the study, using a structured questionnaire as the instrument of data collection. Five research questions guided the study. Of 150 questionnaires distributed, 112 were filled out correctly and returned, and used for analysis. Results show that innovative services effectively provide information literacy skills to students, fill institutional repositories, and provide e-reference services. The contribution of innovative services to improved learning relies on the positive reports from faculty on the improvement of student performances. The major challenges to innovative services are inadequate funding, lack of infrastructural facilities, inadequately trained personnel, and management indifference.

Different scholars examined different aspects of innovative library services among librarians in Nigeria, all arriving at different conclusions. However, those studies differ in terms of findings, setting, population, and subject focus. The present study is distinguished from the past studies, as it focuses solely on how to equip library and information professionals towards the provision of innovative library services.

Methodology

Quantitative research method was used. A survey research design was adopted for the study. Data was collected through a structured questionnaire titled 'Innovation for Library Service Provision Questionnaire' (ILSPQ). The instrument was on a four-point Likert scale: Strongly Agree (4), Agree (3), Disagree (2), and Strongly Disagree (1). The questionnaire was administered to librarians working in academic libraries at Baze University and the National Open University of Nigeria, online using Google form without research assistants. The population of the study consisted of academic librarians in Baze University (13) and the National Open University of Nigeria (64), study centres across the country

while purposive sampling was used to select the study sample size from the population. Descriptive statistics, including mean and standard deviation, were used to analyse the research questions, while Regression analysis was used to test the hypothesis. The mean of 1.0-2.4 was considered low, while 2.5 or above was considered for decision-making.

Presentation of Result

This section deals with presentation of result and discussion of findings. The result is presented in tables according to the objectives of the study.

Table 1: Innovative library services in the 21st century

S/N	Statements	Mean	STD
1	Short message library services	3.12	.748
2	Online information search services	3.36	.582
3	Digital reference library services	3.36	.647
4	Digital marketing library services	3.32	.716
5	Database library services	3.51	.503
6	Social media library services	3.54	.502
7	Online library support services	3.47	.503
8	Online current awareness services	3.34	.722
9	Online Public Access Catalogue (OPAC)	3.43	.660
	Cluster mean	**3.38**	**.620**

Source: field survey, 2026

The findings in table 1indicate that the respondents were in agreement that several innovative services are being applied in libraries. The services of a social media library achieved the greatest mean score (M = 3.54, SD =.502). This was then closely followed by database library services (M = 3.51, SD =.503) and online library support services (M = 3.47, SD =.503), which indicated that the digital information systems and online assistance have become an important part of the contemporary library operation. Online Public Access Catalogue (OPAC) (M = 3.43, SD =.660) in terms of its value in the provision of access to the library collections. More so, the online information search services and online reference library services have the same mean value (M = 3.36) with a standard deviation of 582 and 647, respectively. Respondents also recognized online current awareness services (M = 3.34, SD =.722) and online marketing library services (M = 3.32, SD =.716). SMS library services had the lowest mean score (M = 3.12, SD =.748). The cluster mean of 3.38 and standard deviation of .620 indicate that innovative library services are popular in libraries in the 21st century.

Table 2: Methods of equipping librarians and information services professionals

S/N	Statements	Mean	SD
1	My institution provides adequate funds for staff training and sponsorship of innovative library services.	2.88	.979
2	My office organises computer training for staff over time on innovative library services.	2.89	.842
3	My institution organises seminars and workshops on innovative library services.	3.08	.707
4	I engaged in personal virtue training on innovative library services.	3.25	.695
5	I sponsor myself to digital training workshops on innovative library services.	3.41	.570
6	I enrolled in private computer and internet training workshops on innovative library services.	3.13	.772
	Cluster mean	**3.10**	**.760**

Source: field survey, 2026

The findings in table 2 indicate different degrees of consensus amongst the respondents with respect to the capacity-building methodology. Digital training workshops on innovative library services were the best in terms of the highest mean score (M = 3.41, SD = .570). It was then succeeded by the participation in personal training regarding the innovative library services (M = 3.25, SD = .695). The attendance at private computer and internet training workshops also obtained a fairly high mean (M=3.13, SD=.772). Moreover, the involvement in seminars and workshops that the institutions conducted about the innovative library services had M=3.08, SD .707. Mean scores, however, were lower in the case of institutional support like arranging computer training for staff (M = 2.89, SD = .842) and availing of sufficient funds to train and sponsor staff (M = 2.88, SD = .979), implying that respondents do not have a positive view in terms of institutional financial support to develop professional services in innovative library services. The mean of the cluster is 3.10, and the standard deviation is .760, which shows librarians have different methods of equipping them for innovative library services.

Table 3: Innovative library services provided in the 21st century

S/N	Statements	SD	STD
1	I provide short message library services.	3.00	.766
2	I provide online information search services.	3.36	.687
3	I provide Digital reference library services	3.33	.719
4	I provide Digital marketing library services	3.11	.918
5	I provide Database library services	3.34	.579
6	I provide **S**ocial media library services	3.11	.759
7	I provide Online library support services	3.04	.871
8	I provide Online current awareness services	3.16	.784
9	I provide an Online Public Access Catalogue (OPAC	3.39	.694
	Cluster mean	**3.20**	**.753**

Source: field survey, 2026

The findings in Table 3 show that most of the respondents reported that they offer different innovative services in libraries. The highest mean score (M = 3.39, SD =.694) was recorded in the Online Public Access Catalogue (OPAC). This was then closely trailed by the online information search services (M = 3.36, SD =.687) and database library services (M = 3.34, SD =.579), implying that online information search and accessing a database are very common in library service delivery. The mean (M = 3.33, SD =.719) recorded by digital reference library services was relatively high. The online current awareness services showed a mean score of (3.16, SD= 784). The mean value (M = 3.11) of social media library services and digital marketing library services was equal (.759 and.918) in value, respectively, which means that these services are provided moderately. Online library support services had a mean of 3.04 (SD =.871), and this indicates that the respondents partially offer online support to library users. The lowest mean score (M = 3.00, SD =.766) was obtained by short message library services, yet it still indicates the agreement of the respondents that the service is offered. The mean of the cluster of 3.20 and 0.753 shows that librarians offer innovative services in the library.

Table 4: Challenges of equipping librarians for innovative library services in the 21st century

S/N	Statements	Mean	STD
1	There is a power failure always	3.49	.792
2	The network does not always work	3.33	.737
3	Most of the clientele are computer illiterate	2.92	1.004
4	I am not computer-literate	2.01	1,000
5	I do not possess digital skills	1.99	.902
6	I lack management support	2.39	1.096
7	There is a lack of training and retraining	2.86	.934
8	Lack of available ICT infrastructure in the library	2.76	1.057
	Cluster mean	**2.71**	**0.940**

Source: field survey, 2026

The findings in table 4 reveal that the respondents have pointed out a number of limitations that impact the successful provision of innovative library service. The largest mean score (M = 3.49, SD =.792) was obtained in power failure. This was then succeeded by low network connectivity (M = 3.33, SD =.737), which implies that volatile internet services limit innovative services. The majority of patrons of the library who are computer illiterate had a mean score of 2.92 with a standard deviation of 1.004. Absence of training and retraining of personnel also scored a similar moderate mean value (M = 2.86, SD = .934), indicating that the inadequacy of opportunities for staff to develop professionally influences the capacity of the librarian to offer innovative services. Unavailability of ICT infrastructure in the library had a mean of 2.76 (SD = 1.057). Lack of management support had a mean value of 2.39 (SD = 1.096), which shows that some of the respondents do not feel that the management is supportive of new library projects. Nonetheless, the respondents mostly did not agree with the statements that they are not computer literate (M = 2.01, SD = 1.000) and that they lack digital skills (M = 1.99, SD =.902), which means that the librarians tend to believe that they are competent in using the digital technologies. The mean of 2.71 and a standard deviation of 0.940 imply that a lot of challenges to equipment and provision of innovative library services in the 21st century.

Hypotheses

$H0_1$: Methods of equipping librarians and information services professionals do not predict the provision of innovative library services by librarians in the 21st century

Table 5: Regression Analysis

ANOVA						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	19.785	1	19.785	106.819	.000[b]
	Residual	13.706	74	.185		
	Total	33.491	75			
a. Dependent Variable: P						
b. Predictors: (Constant), M						

The F-statistic is 106.819 with a significance value (Sig.) of <.001, which is well below the conventional alpha level of 0.05. This indicates that the regression model is statistically significant, meaning that the predictor variable (Methods of equipping) significantly explains variance in the dependent variable (Provision of innovative library services). This suggests that changes in Methods of equipping are associated with meaningful changes in the provision of innovative library services, and the model provides a good fit for the data.

Discussion of Findings

The study indicated that the 21st century has different innovative library services. This is in line with Etebu and Zacchaeus (2020), who found that there were various innovative services available in the Nigerian libraries, such as online current awareness services, web design, digital references, mobile application services, and online workshops. Their research, which was done in Bayelsa State, also indicated that innovative services enhance information access and satisfaction of the needs of users.

The findings also revealed that librarians have various ways of equipping for innovation in library services. A similar result is observed in the study by Okeji et al. (2020), who evaluated digital literacy among librarians in privately based university libraries in the state of Anambra. Their results revealed that librarians usually pay themselves to train and participate in workshops despite the problems of power interruptions and the weak internet connection. Equally, Madukoma (2021) expressed that Nigerian librarians apply their experience and self-initiative to create new solutions within the libraries.

The research also found that the librarians provide innovative services to their libraries, which shows that their skills are practically applied. This is supported by the results of Ukwuoma, Dim, and Chigbu (2021), who found that innovative services that are driven by ICT enhance information delivery, such as e-reference services, the development of an institutional repository, and training of information literacy. Besides that, provision of digital twilights, online user education, and social media-based library resources, as was found in North-West Nigeria, demonstrates that involvement of librarians with innovative service provision improves user experience and academic performance.

Although these positive developments were made, the research found that there were serious challenges in equipment, as well as in the delivery of innovative library services. Contrary to Etebu and Zacchaeus (2020) and Ukwuoma et al. (2021), such problems as a lack of funds, poor ICT infrastructure, power failure, and shortage of skilled staff were identified to hinder the smooth provision of innovative services. This observation shows that there is an ongoing obstacle in all sorts of academic libraries in Nigeria, and this indicates that innovative services are increasingly becoming more available, but there are problems in the system that tend to restrict the extent of their application.

Summary of Findings

The summary of findings are:

1. Findings revealed that libraries have different innovative library services
2. Librarians have different methods of equipping themselves for innovative library services.
3. Findings show that librarians offer diverse innovative services in the library.
4. Librarians faced a lot of challenges in equipping and providing innovative library services in the 21st century.
5. Methods of equipping significantly predict the provision of innovative library services by librarians

Conclusion

The study examined how librarians are prepared for innovative library services, which are on the rise in the 21st century, with librarians using different strategies to prepare themselves to deliver quality services. Results show that librarians are actively offering such new services, but resources and equipment continue to be a challenge. Notably, the research has revealed that the approaches employed to prepare librarians have a major impact on their capacity to provide innovative library services, and therefore, there is a need to provide librarians with specific training, resources, and support to improve the delivery of innovative library services in the present era.

Recommendations

Based on the findings, the following recommendations are made:

1. Libraries should adapt and increase their innovative services to address the changing needs of the users and remain relevant in the 21st century.
2. Training programs should be standardized by the institutions, and continuous training should be provided on the professional development of all librarians to make them well-equipped.
3. Management ought to reward the efforts of the librarians by offering incentives, mentoring, and providing resources to maintain the provision of innovative service in the library.
4. Libraries should invest in new infrastructure, information and communications technology, and maintenance policies.

Federal University of Technology, Minna, Nigeria

Abstract

The transformation of the global information environment has significantly redefined the roles of librarians in academic institutions, shifting emphasis from traditional custodial functions to technology-driven and user-centred service delivery. This paper examines the competencies required to equip librarians for innovative library service delivery in the 21st century, with particular reference to academic libraries in Nigeria. Using a descriptive and analytical approach, the study explores emerging roles such as digital facilitation, research support, and data management, alongside key competency areas including ICT skills, data literacy, and instructional capabilities. The paper identifies persistent challenges limiting librarians' capacity for innovation, including inadequate professional training, weak technological infrastructure, skills mismatch, and limited institutional support. It argues that these constraints hinder librarians' ability to effectively respond to evolving demands in higher education. To address these gaps, the study proposes targeted strategies such as continuous professional development, curriculum reform in library and information science education, improved ICT support systems, and strengthened collaboration among stakeholders. The paper concludes that equipping librarians with relevant digital and pedagogical competencies is essential for sustaining innovative library services and enhancing teaching, learning, and research in Nigerian academic institutions.

Keywords: Librarians, innovation, library services, professional development, academic libraries, Nigeria.

1. INTRODUCTION

1.1 Background

Libraries have undergone a profound transformation over the past few decades, evolving from traditional, print-based repositories into dynamic, technology-driven digital knowledge hubs. Historically, libraries were primarily concerned with the acquisition, organisation and preservation of physical materials such as books and journals. However, the rapid advancement of information and communication technologies (ICTs) has redefined their core functions, enabling access to vast collections of digital resources, including e-books, online databases, institutional repositories and multimedia content (Asemi et al., 2021; Tenopir et al., 2023). This transition from traditional to digital libraries has not only expanded access to information but also reshaped how users interact with knowledge systems.

The emergence of the knowledge economy has significantly transformed the roles and responsibilities of librarians in academic libraries. As information professionals, librarians are increasingly expected to support research, teaching, learning and informed decision-making in a knowledge-driven society. The rapid growth of digital information, often described as the "information explosion," requires librarians to develop advanced competencies in information organisation, retrieval, evaluation and digital service delivery. Consequently, equipping librarians with innovative skills and technological expertise has become essential for enhancing the quality, accessibility and relevance of library services in Nigerian academic libraries (Bawden & Robinson, 2022; World Bank, 2023).

Concurrently, user expectations have evolved significantly in response to technological advancements and changing information-seeking behaviors. Modern library users demand seamless, remote and real-time access to information resources across multiple platforms. They increasingly prefer personalized, user-centered services, including intelligent search systems, mobile access and interactive digital environments. The rise of artificial intelligence, data analytics and cloud computing has further influenced these expectations, pushing libraries to adopt innovative service models and enhance user experience (Cox et al., 2023; Joo & Choi, 2022). Consequently, libraries must continuously adapt their services, infrastructure and professional competencies to remain relevant in a rapidly changing information landscape.

In summary, the evolution of libraries, the rise of the knowledge economy and changing user expectations have increased the demand for innovative library services. While academic libraries are expected to provide technology-driven and user-centred services, many librarians in Nigeria still face challenges related to inadequate digital competencies, limited professional development opportunities and insufficient capacity for innovation. This gap between emerging service expectations and the preparedness of librarians highlights the need to examine how librarians can be effectively equipped to deliver innovative services in contemporary academic library environments.

1.2 Problem Statement

Despite the rapid evolution of libraries into digitally driven knowledge systems, major challenges persist in developing countries such as Nigeria. A key issue is the widening skills gap among librarians, as many lack the advanced technical and managerial competencies required for digital services, data-driven decision-making and emerging technologies like artificial intelligence and digital curation. This mismatch limits their ability to manage digital resources effectively and deliver innovative services (Adeleke & Olorunsola, 2022; Cox et al., 2023).

In addition, inadequate technological infrastructure continues to limit librarians' capacity to provide innovative library services. Many academic libraries in Nigeria operate with unreliable internet connectivity, unstable power supply and insufficient access to modern ICT facilities due to inadequate funding. These constraints hinder librarians' effective use of emerging technologies, restrict the delivery of digital and user-centred services and reduce opportunities for professional skill development and innovation (Okiy, 2021; World Bank, 2023).

Furthermore, limited innovation capacity among librarians constrains their ability to respond effectively to the evolving information landscape. Factors such as inadequate training opportunities, insufficient funding for professional development, organizational rigidity and lack of strategic support hinder librarians' adoption of emerging technologies and innovative service models. Consequently, many librarians struggle to design and deliver user-centred services that meet the changing needs of academic library users (Iwhiwhu & Okorodudu, 2022; Asemi et al., 2021).

Overall, these interconnected challenges skills gaps in digital librarianship, inadequate technological infrastructure and limited professional innovation capacity among librarians significantly constrain librarians' ability to design and deliver effective, technology-driven library services in academic institutions in Nigeria. As a result, many librarians are not fully prepared to meet the demands of the evolving digital information environment, creating a gap between expected service delivery standards and actual professional practice. This underscores the need for targeted interventions to strengthen librarians' digital competencies and innovative capacity for improved service delivery in the 21st century.

1.3 Aim and Objectives

The main aim of this study is to examine the need for innovation in library systems in Nigeria within the context of a rapidly evolving digital and knowledge-driven environment.

The specific objectives of the study are as follows:

1. To examine the need to equipped librarians for innovation in library services and operations.
2. To identify the major challenges hindering librarians innovation in Nigerian libraries.
3. To propose strategies for equipping librarians in enhancing innovation capacity in libraries.

1.4 Significance of the Study

This study is important for improving Library and Information Science practice, higher education and policy development in Nigeria. It highlights how libraries can adopt innovative, user-centered and technology-driven services to enhance performance (Cox et al., 2023). It also supports higher education by strengthening libraries' roles in research, learning and digital access, addressing gaps in skills and infrastructure (Tenopir et al., 2023). Additionally, the study provides guidance for policymakers to improve funding, infrastructure and professional development, aligning library growth with national development goals (World Bank, 2023).

2. LITERATURE REVIEW

2.1 Concept of Innovative Library Services

Innovation in Library and Information Science (LIS) refers to the introduction and application of new ideas, technologies, processes, or service models aimed at improving the efficiency, effectiveness and user experience of library services. It encompasses both incremental improvements to existing systems and transformative changes that redefine how libraries operate and deliver value to users. In the contemporary information environment, innovation is increasingly driven by rapid technological advancements and the need to remain relevant in a competitive, knowledge-based society (Bawden & Robinson, 2022; Asemi et al., 2021).

Within the LIS context, innovation extends beyond the adoption of new technologies to include the redesign of services to meet evolving user needs. This includes user-centered approaches, collaborative knowledge creation and the integration of digital tools that enhance information access and engagement. As libraries transition from traditional repositories to interactive learning environments, innovation has become a critical factor in sustaining their relevance and impact (Cox et al., 2023). A major dimension of innovative library services is the deployment of **technology-driven solutions**. These include digital libraries, institutional repositories, cloud-based systems, artificial intelligence (AI)-powered search tools and data analytics for personalised services. Technologies such as machine learning and natural language processing are increasingly being used to improve information retrieval, automate cataloguing processes and provide intelligent user support systems (Joo & Choi, 2022). Additionally, mobile technologies and remote access platforms enable users to interact with library resources anytime and anywhere, reflecting the shift toward ubiquitous information access.

Furthermore, innovative services in libraries often involve the creation of virtual learning spaces, makerspaces and digital scholarship centers that support interdisciplinary research and creativity. These developments highlight the evolving role of libraries as active facilitators of knowledge production rather than passive information providers. However, the successful implementation of such innovations depends on the availability of technological infrastructure, skilled personnel and institutional support (Adeleke & Olorunsola, 2022). In fact, innovative library services are characterised by the strategic integration of technology, user-centered design and adaptive service models. As the

information landscape continues to evolve, libraries must embrace innovation to effectively meet the changing expectations of their users and to maintain their role as essential components of the knowledge ecosystem.

2.2 Emerging Trends in Academic Libraries

Academic libraries are undergoing rapid transformation driven by technological advancements, evolving research practices and changing user expectations. These developments are redefining librarians' roles, requiring them to move beyond traditional custodial functions to more dynamic, technology-driven and user-centred service delivery. Consequently, librarians must be adequately equipped with relevant competencies to remain effective in the 21st-century academic environment.

2.2.1 Digital Scholarship: Digital scholarship represents a major shift in how knowledge is created, analysed and disseminated through the use of digital tools such as text mining, data visualisation and digital humanities platforms. This trend is redefining librarians' roles as active partners in research and scholarly communication rather than passive information providers.

To support digital scholarship effectively, librarians must be equipped with competencies in data literacy, digital research tools, metadata management and collaborative research support. However, many librarians in Nigerian academic libraries still lack adequate training and exposure in these areas, limiting their ability to fully participate in digital scholarship initiatives (Cox et al., 2023).

2.2.2 Research Data Management (RDM): Research Data Management (RDM) has become a critical service in academic libraries due to the rise of data-intensive research and open science practices. This development requires librarians to support researchers in organising, documenting, preserving and sharing research data throughout the research lifecycle.

To function effectively in this role, librarians must be equipped with skills in data curation, metadata standards, data repositories, data ethics and research support services. Despite this growing demand, many librarians in Nigeria lack sufficient RDM training and competencies, which constrains their ability to support data-driven research effectively (Tenopir et al., 2023).

2.2.3 Virtual Reference Services: Virtual reference services have expanded significantly, enabling librarians to provide real-time assistance through digital platforms such as live chat, email, video conferencing and AI-enabled tools. This shift has extended librarians' service delivery beyond physical library spaces to remote and hybrid environments.

To deliver effective virtual reference services, librarians must be equipped with digital communication skills, online user engagement strategies and proficiency in information retrieval technologies. However, limited digital skills and inadequate training among librarians in Nigerian academic libraries often reduce the effectiveness of these services (Joo & Choi, 2022).

2.2.4 Information Literacy Instruction: Information literacy instruction remains a core function of academic librarians but has evolved to address challenges such as information overload and misinformation. Librarians are now expected to design and deliver structured programmes that develop users' critical thinking and information evaluation skills.

To achieve this, librarians must be equipped with instructional design skills, digital pedagogy competencies and the ability to integrate information literacy into academic curricula. However, many librarians in Nigeria lack adequate pedagogical preparation, which limits the effectiveness of information literacy instruction in academic institutions (Bawden & Robinson, 2022).

2.2.5 Social Media Engagement: Social media has become an important platform for academic librarians to promote services, communicate with users and enhance library visibility. Platforms such as X (Twitter), Facebook, Instagram and LinkedIn are now widely used for outreach and engagement.

To leverage social media effectively, librarians must be equipped with digital communication, content creation, audience engagement and digital branding skills. However, limited expertise in social media management among librarians in Nigeria reduces its effectiveness as a strategic library service tool (Asemi et al., 2021).

Overall, these emerging trends highlight a fundamental shift in academic librarianship, where librarians are expected to possess advanced digital, instructional and research support competencies. However, persistent skills gaps among librarians in Nigerian academic libraries create a mismatch between expected service delivery standards and actual professional capacity. This underscores the need for targeted capacity-building interventions to equip librarians for innovative library service delivery in the 21st century.

2.3 Competency Framework for Librarians

The transformation of academic libraries into digitally driven and user-centered knowledge hubs has significantly redefined the competencies required of librarians. Contemporary library professionals are expected to possess a diverse set of skills that extend beyond traditional cataloguing and reference services. A comprehensive competency framework typically encompasses digital, pedagogical and managerial/leadership skills, all of which are essential for effective service delivery and institutional relevance in the modern information landscape.

2.3.1 Digital Skills

Digital competencies are foundational to modern librarianship, given the increasing reliance on technology in information creation, organisation and dissemination. Librarians are expected to demonstrate proficiency in the use of digital library systems, institutional repositories, data management tools and online databases. Additionally, skills in areas such as metadata standards, digital preservation and information retrieval systems are critical. Emerging technologies including artificial intelligence, data analytics and cloud computing further require librarians to continuously update their technical expertise to remain effective in supporting digital scholarship and research activities (Cox et al., 2023; Joo & Choi, 2022).

Beyond technical proficiency, digital literacy also involves the ability to critically evaluate digital resources, ensure information security and support users in navigating complex digital environments. As such, ongoing professional development and training are essential to bridge existing skills gaps, particularly in developing contexts where access to advanced ICT infrastructure may be limited (Adeleke & Olorunsola, 2022).

2.3.2 Pedagogical Skills

As academic libraries increasingly take on instructional roles, pedagogical competencies have become a vital component of librarianship. Librarians are now actively involved in teaching information literacy, guiding users in research methodologies and supporting academic writing and critical thinking. Effective instruction requires an understanding of learning theories, curriculum design and assessment strategies. Modern approaches to information literacy emphasise learner-centered and collaborative teaching methods, including embedded librarianship, flipped classrooms and online learning modules. Librarians must also be adept at using digital teaching tools such as learning management systems and multimedia resources to deliver engaging and accessible instruction. These pedagogical skills enable librarians to contribute meaningfully to student learning outcomes and academic success (Bawden & Robinson, 2022).

2.3.3 Managerial and Leadership Skills

Managerial and leadership competencies are essential for navigating the complexities of modern library environments. Librarians are increasingly required to lead innovation initiatives, manage digital transformation projects and oversee multidisciplinary teams. Key skills in this domain include strategic planning, project management, change management and effective communication.

Leadership in libraries also involves fostering a culture of innovation, advocating for institutional support and building partnerships within and beyond the academic community. In resource-constrained environments such as Nigeria, strong leadership is particularly important for optimising available resources, securing funding and driving sustainable development. Librarians who possess these competencies are better positioned to influence policy decisions and guide their institutions through ongoing technological and organisational changes (Iwhiwhu & Okorodudu, 2022; Cox et al., 2023).

2.4 Challenges Facing Librarians in the Adoption of Innovation in Academic Libraries

Despite the increasing demand for innovative library services, librarians in academic libraries in Nigeria continue to face several interrelated challenges that limit their capacity to effectively adopt and implement innovation. These challenges are largely structural and professional, affecting librarians' ability to respond to the demands of the 21st-century digital information environment.

2.4.1 Infrastructural Constraints Affecting Librarians' Practice: Inadequate technological infrastructure significantly limits librarians' ability to deliver innovative, technology-driven services. Effective performance in modern librarianship depends on access to reliable internet connectivity, functional ICT facilities, stable power supply and up-to-date digital tools. However, many librarians in Nigerian academic institutions operate under conditions of frequent power outages, poor internet access and obsolete technological systems. These constraints hinder librarians' use of emerging technologies such as institutional repositories, cloud-based platforms and artificial intelligence tools, thereby restricting their capacity to innovate in service delivery (World Bank, 2023; Okiy, 2021).

2.4.2 Funding Limitations and Professional Development Opportunities for Librarians: Limited funding continues to restrict librarians' ability to engage in innovation-related activities. Adequate financial support is required for librarians' continuous professional development, acquisition of digital competencies, participation in training programmes and exposure to emerging technologies. However, many librarians in Nigerian academic institutions experience limited access to such opportunities due to insufficient institutional funding. This reduces their capacity to update their skills and adopt innovative practices, thereby slowing down service transformation in academic libraries (Adeleke & Olorunsola, 2022; Iwhiwhu & Okorodudu, 2022).

2.4.3 Skills Gaps and Resistance to Innovation among Librarians: A major barrier to innovation in academic libraries is the persistent skills gap among librarians. The rapid evolution of digital librarianship requires competencies in data management, digital curation, information systems and emerging technologies such as artificial intelligence and automation. However, many librarians lack continuous professional development opportunities, resulting in a mismatch between required and existing competencies.

In addition, resistance to change among some librarian's further limits innovation adoption. Factors such as low motivation, limited exposure to global best practices and organisational inertia reduce willingness to embrace new service models and technologies. These challenges collectively weaken librarians' ability to implement and sustain innovative library services in academic environments (Cox et al., 2023; Joo & Choi, 2022).

2.5 Theoretical Framework

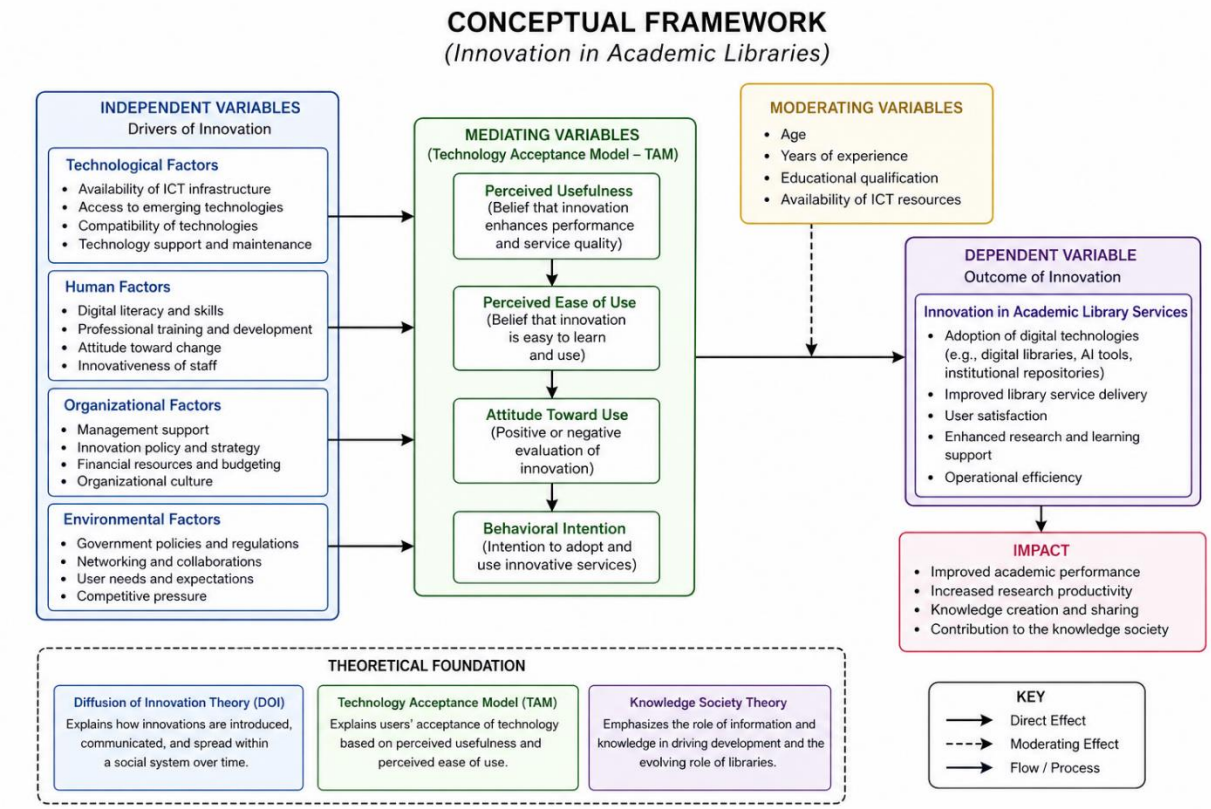
This study was grounded in three key theories that explain how innovation is introduced, accepted and sustained in academic libraries: Diffusion of Innovation (DOI) Theory, Technology Acceptance Model (TAM) and Knowledge Society Theory.

The Diffusion of Innovation Theory explains how new technologies and practices spread within organisations, highlighting stages of adoption and categories of adopters. It shows that factors such as perceived benefits, compatibility and complexity influence how innovations like digital libraries and AI tools are adopted, while challenges such as poor infrastructure and resistance to change slow adoption in developing contexts (Rogers, 2003; Iwhiwhu & Okorodudu, 2022).

The Technology Acceptance Model focuses on users' willingness to adopt technology based on perceived usefulness and ease of use. In academic libraries, it explains how librarians and users accept digital tools, noting that limited digital skills and inadequate training can hinder effective utilization (Davis, 1989; Joo & Choi, 2022).

Knowledge Society Theory emphasizes the role of knowledge and information in development, positioning libraries as active contributors to knowledge creation and dissemination. It highlights the need for libraries to adopt digital technologies and innovative services, while stressing the importance of infrastructure, skilled personnel and supportive policies (UNESCO, 2021; World Bank, 2023).

Together, these theories provide a comprehensive framework in figure 1 for understanding innovation in academic libraries by addressing adoption processes, user acceptance and the broader role of libraries in a knowledge-driven society.



The conceptual framework figure 1 explains that innovation in academic libraries results from the interaction of technological, human, organizational and environmental factors. These independent variables determine the capacity for innovation through elements such as ICT infrastructure, staff competencies, institutional support and external pressures.

User perceptions drawn from the Technology Acceptance Model serve as mediating variables, where perceived usefulness and ease of use influence attitudes and intention to adopt new technologies. Moderating factors such as age, experience and access to ICT further shape these relationships.

The outcome (dependent variable) is innovation in library services, reflected in improved service delivery, technology adoption, user satisfaction and operational efficiency. Ultimately, this leads to broader impacts such as enhanced research productivity and contribution to a knowledge-based society.

3. METHODOLOGY

This study adopts a descriptive and analytical research design based on a literature review, relying on existing scholarly works rather than primary data. The descriptive aspect outlines key concepts and trends in academic library innovation, while the analytical component evaluates literature to identify patterns, gaps and relationships. A narrative review approach is used, drawing from credible sources such as Scopus, Web of Science and Google Scholar to ensure rigor and relevance.

The study uses secondary data from peer-reviewed journal articles, books, policy documents, institutional reports (e.g., UNESCO and World Bank) and conference proceedings. These sources provide both theoretical foundations and current insights into digital transformation, innovation and challenges in academic libraries.

For analysis, the study employs thematic and comparative methods. Thematic analysis organizes findings into key areas such as services, technologies, competencies and challenges, while comparative analysis examines differences across regions, especially between developed and developing contexts like Nigeria. Together, these approaches ensure a comprehensive and evidence-based understanding of innovation in academic libraries.

The study applies clear inclusion and exclusion criteria to ensure quality and relevance. Included sources consist of peer-reviewed articles, scholarly books and credible institutional reports (e.g., UNESCO, World Bank), mainly published between 2010 and 2025, with a focus on recent studies addressing library innovation, digital transformation and related themes. Excluded materials include non-peer-reviewed works, irrelevant studies, outdated sources, duplicates and those lacking academic rigor.

Some limitations are acknowledged. The study relies only on secondary data, limiting empirical validation and includes only English-language sources, which may reduce global coverage. It is also subject to publication bias and the challenge of rapidly evolving technologies that may outdate findings over time.

To ensure transparency, a PRISMA-style process was used for literature selection. This involved identifying relevant studies, removing duplicates, screening titles and abstracts, assessing full-text eligibility and finally selecting high-quality studies for analysis. This systematic approach strengthens the credibility and reliability of the review.

RESULTS / ANALYSIS (THEMATIC ANALYSIS)

Emerging Roles of Librarians

The analysis shows that librarians' roles have significantly evolved due to digital transformation and changing user needs. Three key roles emerged: digital facilitators, research support specialists and data managers.

Digital facilitators: Librarians now support users in navigating digital platforms, online databases and virtual learning systems. They enable access to digital resources and bridge the digital divide. This role requires strong ICT competence and user support skills (Cox et al., 2023; Joo & Choi, 2022).

Research support specialists: Librarians increasingly assist researchers with literature searches, systematic reviews, citation management and scholarly publishing. This positions them as active partners in research rather than passive information providers (Tenopir et al., 2023).

Data managers: Librarians also manage research data through collection, organisation, preservation and sharing. This role demands advanced skills in data curation, metadata and research data management systems, which are still developing in many contexts.

Overall, these roles reflect a shift toward technology-driven and research-oriented librarianship, requiring continuous capacity development.

Required Competencies for Librarians in the Digital Age

The findings indicate that evolving roles require librarians to develop new competencies in three main areas: ICT skills, data literacy and teaching skills.

ICT skills: Librarians must be proficient in digital systems, databases, metadata management and emerging technologies. However, ICT skill gaps remain a major challenge in many developing contexts, including Nigeria (Adeleke & Olorunsola, 2022).

Data literacy: Librarians are expected to support research data management, including data curation, ethics and preservation. This competency is essential in modern research environments (Tenopir et al., 2023).

Teaching skills: Librarians now deliver information literacy instruction and support curriculum integration. This requires pedagogical and instructional design skills (Bawden & Robinson, 2022).

These competencies collectively define modern librarianship and are critical for effective service delivery in digital academic environments.

Gaps Identified in the Literature

Two major gaps emerge from the literature: skills mismatch and institutional weaknesses.

Skills mismatch: There is a clear gap between librarians' existing skills and the competencies required for modern digital services such as AI tools, data management and digital scholarship support (Cox et al., 2023).

Institutional weaknesses: Poor funding, weak policy support and limited strategic investment hinder innovation in academic libraries. These conditions restrict infrastructure development and staff capacity building (World Bank, 2023).

Overall, the literature shows that limited human capacity and weak institutional support jointly constrain innovation in academic libraries.

DISCUSSION

Theoretical Interpretation

Diffusion of Innovation Theory: The study findings show slow adoption of innovation due to infrastructure deficits, limited funding and weak skills. These barriers increase the perceived complexity of new technologies, slowing diffusion in academic libraries (Rogers, 2003).

Technology Acceptance Model (TAM): Even where technologies exist, low perceived ease of use and usefulness driven by skills gaps and limited training reduce adoption among librarians (Davis, 1989).

Together, both theories explain that innovation depends on both institutional readiness and individual acceptance.

Global Comparison (Developed vs Developing Contexts)

In developed countries, academic libraries operate advanced digital systems, including AI tools, strong data infrastructure and well-funded digital scholarship services. Innovation is systematic and well-supported.

In contrast, libraries in developing countries like Nigeria face infrastructural deficits, funding limitations and skills shortages. Innovation is slower and often fragmented.

However, global initiatives in open access and capacity building are gradually narrowing this gap (World Bank, 2023).

Nigerian Context: Structural and Policy Barriers

In Nigeria, innovation in academic libraries is constrained by poor ICT infrastructure, unstable power supply and inadequate funding. These structural issues limit digital service delivery and innovation sustainability.

Policy-related challenges, including weak implementation of library development policies and low institutional prioritisation, further hinder progress. As a result, there is a gap between policy intentions and actual practice.

Despite these challenges, emerging digital initiatives and international support provide opportunities for improvement, but sustained investment in infrastructure and librarian capacity is essential.

STRATEGIES FOR ENHANCING INNOVATIVE SERVICE DELIVERY AMONG LIBRARIANS

This section presents key strategies for strengthening librarians' capacity for innovative service delivery in academic libraries. The strategies are derived from the literature and address identified skills and institutional gaps affecting librarians in the digital knowledge economy.

Continuous Professional Development for Librarians

Continuous professional development is essential for equipping librarians with the digital and research competencies required in modern academic libraries. Regular training programmes, workshops and certifications in areas such as digital librarianship, data management, artificial intelligence and information systems are critical. Participation in conferences and professional networks further enhances librarians' exposure to global best practices and emerging technologies.

Reform of Library and Information Science (LIS) Education

LIS curricula should be updated to equip future librarians with relevant 21st-century competencies. This includes training in digital libraries, data science, research data management, digital scholarship and information analytics. Practical, technology-based learning is necessary to bridge the gap between academic preparation and professional demands in innovative library environments.

Strengthening ICT Competence through Institutional Support

Librarians require sustained institutional support to effectively apply ICT in service delivery. This includes access to modern digital tools, integrated library systems and stable internet services. Strengthening ICT competence enables librarians to manage digital collections, support virtual services and adopt emerging technologies effectively.

Collaboration and Knowledge Sharing among Librarians

Professional collaboration enhances librarians' innovation capacity through shared learning and exposure to new practices. Partnerships with other librarians, academic institutions and professional networks provide opportunities for skill development, mentoring and technology transfer. Such collaborations strengthen librarians' ability to adopt innovative service models.

Policy Support for Librarian Capacity Development

Strong institutional and national policies are required to support continuous capacity building for librarians. Policies should prioritise training, innovation funding and structured professional development pathways. Effective implementation ensures that librarians are adequately prepared to respond to evolving service demands.

Collectively, these strategies emphasise strengthening librarians' competencies as the foundation for innovative library service delivery. Addressing skills gaps, improving training systems and enhancing institutional support are essential for enabling librarians to function effectively in the 21st-century academic environment.

CONCLUSION

This study set out to examine the need for innovation in academic libraries, identify key challenges and propose strategies for improving innovative service delivery, particularly within the Nigerian context. The review of literature demonstrates a clear shift in the role of academic libraries from traditional information custodians to dynamic,

technology-driven knowledge service providers. This transformation is driven by rapid technological advancement, the growth of the knowledge economy and increasing user expectations for fast, seamless and digital access to information.

A core argument emerging from the study is that innovation in academic libraries is no longer optional but essential for relevance and sustainability. However, despite this necessity, libraries especially in developing countries continue to face persistent challenges such as inadequate infrastructure, limited funding, skills gaps and weak institutional and policy support. These constraints significantly slow down the adoption and effective implementation of innovative library services. The study also emphasises the urgency of addressing these challenges, as delays in innovation deepen the digital divide between developed and developing library systems. In an era defined by data-intensive research, artificial intelligence and digital scholarship, academic libraries that fail to innovate risk marginalisation within the broader knowledge production ecosystem.

Importantly, the findings reaffirm the continued relevance and strategic importance of librarians in the digital age. Far from becoming obsolete, librarians are increasingly central to research support, data management, digital literacy training and knowledge facilitation. Their evolving roles position them as key actors in enabling access to information, supporting academic success and advancing institutional research output.

In conclusion, sustainable innovation in academic libraries requires coordinated efforts in professional development, infrastructure investment, curriculum reform, collaboration and strong policy frameworks. Strengthening these areas will ensure that libraries remain vital, responsive and impactful institutions within the global knowledge economy.

Recommendations

Based on the findings of this study, it is recommended that academic institutions strengthen continuous professional development programmes for librarians, particularly in emerging areas such as digital librarianship, data management and artificial intelligence applications. Library and Information Science curricula should be updated to reflect current digital realities. Furthermore, institutions should improve ICT infrastructure and promote collaborative learning opportunities among librarians. Finally, strong policy support is required to ensure sustained capacity development and innovation in library service delivery.

Abstract

This paper examines ethical use of AI in academic reference services, with particular attention to how such technologies are redefining the traditional librarian–user interaction. AI tools such as chatbots, virtual assistants and automated knowledge retrieval systems are increasingly being deployed to enhance service efficiency, provide 24/7 support and manage high volumes of user inquiries. However, their implementation raises important ethical concerns, including issues related to data privacy, algorithmic transparency, bias and the potential erosion of the human element in library services. The study draws upon existing literature, professional guidelines (e.g., ALA, IFLA) and theoretical frameworks from information ethics and human-centered design to explore the implications of AI for academic librarianship. It emphasizes the need to balance automation with core library values such as equity, empathy, intellectual freedom and trust. Moreover, the paper interrogates the shifting professional roles of academic librarians in AI-enhanced environments, highlighting the competencies required to supervise, evaluate and ethically manage AI-based systems. By synthesizing conceptual and narrative insights, the paper identifies emerging challenges and delineates strategic recommendations for the ethical deployment of AI in reference services. These include developing institutional AI policies, enhancing librarian training in digital ethics and promoting hybrid models that integrate AI under librarian oversight. Ultimately, the paper advocates for an ethical, user-centered approach to AI adoption that strengthens the integrity and relevance of academic reference services in the digital age.

Keywords: Artificial Intelligence (AI); Academic Libraries; Reference Services; Ethics and Librarianship

1. Introduction

In recent years, academic libraries have witnessed a paradigm shift driven by the rapid advancement of emerging technologies, particularly artificial intelligence (AI). The application of AI has the potential to revolutionize library operations, improve user access to information and enhance the quality-of-service delivery across a range of functions. From collection development and discovery systems to information retrieval and user engagement, AI is being embedded into the infrastructure and workflows of academic libraries around the world (Cox, Pinfield, & Rutter, 2019).

One of the most notable developments is the integration of **AI-enabled reference services**, such as **chatbots, virtual assistants** and **machine learning algorithms**, which aim to support users in finding information quickly, 24/7 and with minimal human intervention. These tools are designed to simulate human reference interactions by responding to user queries, guiding them to relevant databases or catalogues and providing curated resources (Wang, Fang, & Ye, 2022). Such innovations are particularly useful in institutions with high user traffic or limited staffing, offering the promise of efficiency, scalability and real-time assistance.

However, the integration of AI into reference services introduces a set of **ethical and professional concerns** that challenge the foundational principles of academic librarianship. Issues such as **algorithmic bias, lack of transparency, data privacy violations** and **reduced human oversight** threaten to compromise the values of trust, confidentiality and equity that are central to the librarian–user relationship (Ryan & Stahl, 2021). Moreover, there is an increasing risk that reference services may become **depersonalized**, with users interacting more frequently with impersonal systems than with trained professionals capable of providing context-aware and empathetic support (Bodle, 2011). Such a shift not only impacts the quality of reference interactions but may also erode user confidence in the library as a trusted academic space.

In addition to ethical concerns, the deployment of AI in academic reference services also raises **questions about professional responsibility and the evolving role of librarians**. As intermediaries between information systems and end-users, academic librarians must now develop new competencies to manage, supervise and ethically evaluate AI tools. They must also advocate for inclusive, transparent and accountable AI design that reflects the diverse needs of their user communities (Farnel, 2021). The shift from traditional human-mediated services to AI-supported models thus

requires a reimagining of the librarian's role not as a passive operator of technology, but as an **active ethical steward and digital facilitator**.

Against this backdrop, this paper seeks to examine the **responsible use of AI in academic reference services**, with a particular focus on **how it reshapes the librarian–user interaction.** By exploring the ethical implications, service transformation and professional demands associated with AI deployment, the paper aims to provide academic librarians and stakeholders with strategic insights and practical guidelines. As academic institutions increasingly embrace digital transformation, it becomes imperative that such transitions are underpinned by ethical considerations, user-centered values and a strong commitment to professional integrity. This paper aims to explore how artificial intelligence (AI) can be ethically and responsibly integrated into academic reference services, with particular emphasis on preserving the quality of librarian–user engagement and upholding professional standards of academic librarianship.

Objectives:

The objectives of the study are to:

1. examine the ethical concerns associated with the adoption of AI technologies in academic reference services,
2. analyze the evolving roles of academic librarians within AI-enhanced service environments
3. identify strategies for the responsible and context-sensitive integration of AI in reference services.

2.0 Conceptual Review

2.1 Concept of Artificial Intelligence

Artificial Intelligence (AI) refers to the capability of computer systems to perform tasks that normally require human intelligence, including learning, reasoning, problem-solving, perception, and language understanding. AI has emerged as one of the most transformative technologies of the twenty-first century, significantly influencing various sectors, including education, healthcare, finance, and information services.

Definitions of Artificial Intelligence

Artificial Intelligence has been defined by various scholars from different perspectives. According to Russell and Norvig (2021), AI is the study of intelligent agents capable of perceiving their environment and taking actions that maximize their chances of achieving specific goals. Similarly, Kaplan and Haenlein (2019) describe AI as a system's ability to correctly interpret external data, learn from such data, and use the acquired knowledge to achieve predetermined objectives through flexible adaptation.

McCarthy (2007), who coined the term "Artificial Intelligence," defined it as the science and engineering of making intelligent machines capable of performing functions associated with human intelligence. Furthermore, the Organisation for Economic Co-operation and Development (OECD, 2019) defines AI systems as machine-based systems that can make predictions, recommendations, or decisions influencing real or virtual environments based on human-defined objectives.

These definitions collectively highlight AI as a technology that enables machines to simulate cognitive functions traditionally associated with human beings.

Types of Artificial Intelligence

Artificial Intelligence is commonly classified into three major categories based on capability:

Narrow Artificial Intelligence (Weak AI)

Narrow AI refers to systems designed to perform specific tasks within a limited domain. These systems cannot operate beyond their programmed functions. Examples include chatbots, recommendation systems, voice assistants, and search engines (Russell & Norvig, 2021).

General Artificial Intelligence (Strong AI)

General AI describes a hypothetical form of intelligence capable of understanding, learning, and applying knowledge across a broad range of tasks at a level comparable to human intelligence. Although significant progress has been made in AI development, true General AI has not yet been achieved (Kaplan & Haenlein, 2019).

Super Artificial Intelligence

Super AI represents a theoretical stage where machine intelligence surpasses human intelligence in all aspects, including creativity, reasoning, and problem-solving. While currently speculative, discussions surrounding Super AI raise significant ethical and governance concerns (Bostrom, 2014).

AI Applications in Information Services

AI has become increasingly integrated into information services, particularly in libraries and academic institutions. Applications include automated cataloguing, information retrieval, recommendation systems, user behavior analysis, digital preservation, and virtual reference assistance (Cox et al., 2019).

Chatbots and virtual assistants are widely used to provide instant responses to frequently asked questions, while machine learning algorithms support personalized resource recommendations. Natural Language Processing (NLP) enables systems to understand user queries and retrieve relevant information efficiently. Additionally, generative AI tools are

being utilized to assist users in literature searching, research support, and academic writing guidance (Asemi & Asemi, 2018).

The integration of AI technologies has enhanced service efficiency, improved user satisfaction, and expanded access to information resources within academic environments.

2.2 Concept of Reference Services

Reference services constitute a fundamental function of libraries and information centers. They involve assisting users in locating, evaluating, and utilizing information resources to meet their information needs.

Traditional Reference Services

Traditional reference services involve face-to-face interactions between librarians and users within a physical library environment. These services include answering reference questions, guiding users in information retrieval, providing bibliographic instruction, and assisting with the use of library resources (Bopp & Smith, 2011).

Traditional reference services rely heavily on the professional expertise of librarians, who interpret users' information needs and direct them to appropriate information sources. Although effective, these services are constrained by operating hours and physical accessibility.

Digital Reference Services

Digital reference services emerged with advancements in information and communication technologies. These services allow users to obtain information support through electronic channels such as email, web forms, and online databases (Lankes, Gross, & McClure, 2003).

Digital reference services provide greater flexibility and accessibility compared to traditional methods. Users can submit inquiries remotely and receive responses without physically visiting the library. The adoption of digital technologies has expanded the reach of academic libraries and improved service delivery.

Virtual Reference Services

Virtual reference services represent an advanced form of digital reference service that enables real-time communication between librarians and users through live chat, videoconferencing, social media platforms, and AI-powered systems (Chow & Croxton, 2014).

Virtual reference services facilitate immediate assistance and support users regardless of geographical location. The integration of AI technologies has further enhanced virtual reference services by enabling automated responses, personalized recommendations, and continuous service availability. Consequently, virtual reference services have become increasingly important in supporting distance learning and online education.

2.3 AI Technologies Used in Academic Reference Services

The growing adoption of AI technologies in academic libraries has transformed the nature of reference services. Various AI tools are now employed to improve information access, enhance user experience, and support decision-making processes.

Mapping of AI Technologies in Academic Reference Services

AI Technology	Application in Reference Services	Ethical Concern
Chatbots	Answer routine queries and provide instant support	Accuracy, bias
Virtual Assistants	Personalized user assistance and guidance	Privacy and data security
Machine Learning Systems	Resource recommendation and predictive services	Algorithmic bias
Natural Language Processing (NLP)	Query interpretation and information retrieval	Misrepresentation of user intent
Knowledge Retrieval Systems	Intelligent searching and information discovery	Transparency and accountability
Recommendation Engines	Personalized resource suggestions	Filter bubbles and information narrowing
Generative AI Tools	Research assistance, content generation, and academic support	Hallucinations, misinformation, plagiarism concerns

Chatbots

Chatbots are AI-powered conversational systems designed to interact with users through text or voice interfaces. In academic libraries, chatbots provide immediate responses to frequently asked questions, guide users to library resources, and offer basic reference assistance (Okonkwo & Ade-Ibijola, 2021). However, concerns remain regarding response accuracy and the potential for biased information.

Virtual Assistants

Virtual assistants use AI technologies to deliver personalized support to users. They can help users locate resources, schedule appointments, and provide tailored recommendations. While these systems improve user experience, they also raise concerns related to privacy, data collection, and surveillance (Floridi et al., 2018).

Machine Learning Systems

Machine learning systems analyze large datasets to identify patterns and make predictions. In academic reference services, these systems support recommendation services, user behavior analysis, and collection development. Nevertheless, machine learning models may perpetuate existing biases present in training data, leading to unfair outcomes (O'Neil, 2016).

Natural Language Processing (NLP)

Natural Language Processing enables computers to understand and process human language. NLP applications in reference services include query interpretation, semantic searching, and automated question answering. Although NLP enhances information retrieval accuracy, incorrect interpretation of user queries may result in misinformation or reduced service effectiveness (Jurafsky & Martin, 2024).

Knowledge Retrieval Systems

Knowledge retrieval systems employ AI techniques to identify and retrieve relevant information from extensive databases and repositories. These systems improve search efficiency and support evidence-based information access. However, concerns regarding transparency and explainability remain significant (Russell & Norvig, 2021).

Recommendation Engines

Recommendation engines use user preferences and behavioral data to suggest relevant books, journals, databases, and other resources. These systems improve information discovery but may create filter bubbles that limit exposure to diverse perspectives (Pariser, 2011).

Generative AI Tools

Generative AI technologies, such as large language models, are increasingly being used to support academic research, literature reviews, and information synthesis. These tools can generate summaries, answer research questions, and assist users in navigating scholarly resources. However, issues such as hallucinations, misinformation, plagiarism, and lack of source transparency necessitate careful human oversight (Dwivedi et al., 2023).

Overall, AI technologies have enhanced the efficiency and accessibility of academic reference services. Nevertheless, ethical considerations including privacy, bias, transparency, accountability, and information accuracy must be addressed to ensure responsible implementation.

3. Methodology

This study adopts a **conceptual and narrative review approach** aimed at exploring the ethical, professional and technological implications of integrating artificial intelligence (AI) into academic reference services. The purpose of this methodology is to synthesize existing knowledge and frameworks to inform responsible AI adoption in academic libraries without engaging in empirical data collection.

The research methodology is structured around three core components:

- **Review of Scholarly Literature**: A critical review of peer-reviewed literature was conducted to gather insights on AI applications in libraries, ethical concerns in automated services and the evolving functions of academic librarians. Sources were selected from leading databases including Scopus, Web of Science and EBSCOhost, focusing on journals such as *Library Hi Tech*, *The Journal of Academic Librarianship* and *Information, Communication & Society* (Cox, Pinfield, & Rutter, 2019; Wang, Fang, & Ye, 2022).
- **Professional Guidelines and Policy Frameworks**: The study integrates recommendations and ethical codes from globally recognized library associations, such as the **International Federation of Library Associations and Institutions (IFLA)** and the **American Library Association (ALA)**. These bodies provide essential normative guidelines concerning intellectual freedom, data ethics and responsible technology use in library environments (IFLA, 2020; ALA, 2019).
- **Theoretical and Conceptual Analysis**: Ethical concerns are interpreted using key theoretical frameworks from **information ethics, responsible innovation** and **human-centered AI design**. Concepts such as algorithmic fairness, digital trust and professional accountability are central to this analysis (Floridi & Cowls, 2019; Ryan & Stahl, 2021). The role of the librarian is also examined through the lens of professional identity theories, emphasizing the need for ethical stewardship and digital literacy in AI-enhanced settings (Farnel, 2021).

By drawing from diverse sources academic literature, professional standards and conceptual models this methodology enables a multidimensional analysis of how AI is reshaping reference services and the librarian–user dynamic. It also supports the formulation of actionable, ethically grounded recommendations for sustainable AI deployment in academic libraries.

Table 1: Methodology Chart: Conceptual and Narrative Review Approach

Component	Description	Key Sources / Frameworks
1. Scholarly Literature Review	Critical synthesis of peer-reviewed literature on AI in libraries, ethics and librarian roles.	• **Journals**: *Library Hi Tech*, *The Journal of Academic Librarianship*, *Information, Communication & Society* • **Databases**: Scopus, Web of Science, EBSCOhost • **Examples**: Cox et al., 2019; Wang et al., 2022
2. Professional Guidelines & Policies	Integration of global library ethics and standards to evaluate responsible AI practices.	• **IFLA** (2020) • **ALA** (2019) • **Topics**: intellectual freedom, data ethics, technology use
3. Theoretical & Conceptual Analysis	Application of ethical frameworks and identity theories to interpret AI's role and librarian responsibilities.	• **Theories**: Information ethics, Responsible innovation, Human-centered AI • **Key Concepts**: Algorithmic fairness, Digital trust, Professional accountability • **Authors**: Floridi & Cowls (2019); Ryan & Stahl (2021); Farnel (2021)

4. Findings / Results

The conceptual and literature-based analysis yielded several key findings concerning the ethical integration of artificial intelligence (AI) into academic reference services.

Ethical Challenges in AI-Enhanced Library Services

A number of **ethical concerns** consistently surface across the literature regarding the integration of AI in academic reference services. One of the most pressing issues is **algorithmic bias**, which occurs when AI systems trained on incomplete, skewed, or historically biased datasets inadvertently reproduce or reinforce social inequalities (Bevan, 2009; Noble, 2018). For instance, search or recommendation engines embedded in library systems may disproportionately favor dominant cultural perspectives or marginalize alternative viewpoints, thereby undermining the library's mission to support inclusive and equitable access to information.

Closely related is the issue of **data privacy**, particularly with regard to how AI systems collect, store and process user data during reference interactions. Many AI-driven tools rely on extensive data harvesting to improve their predictive accuracy and personalization capabilities. However, without clear data governance frameworks, this reliance can expose users to surveillance risks, violate confidentiality expectations and conflict with ethical norms around informed consent and intellectual freedom (Ryan & Stahl, 2021). This concern is especially critical in academic environments, where users may engage with sensitive topics that require assurance of discretion and privacy.

Furthermore, **lack of transparency** in AI decision-making processes often referred to as the "black box" problem makes it difficult for users and librarians to understand how outputs are generated. When users receive recommendations or reference responses without knowing the basis for those decisions, trust in the system can erode. This is compounded by **accountability gaps**, wherein it becomes unclear who is responsible when AI tools provide inaccurate information, exhibit biased behavior, or fail to meet user needs (Floridi & Cowls, 2019). Without explicit human oversight and institutional accountability measures, errors or harms caused by AI systems may go unaddressed.

Collectively, these challenges strike at the core values of academic librarianship, particularly **trust, fairness, intellectual freedom and professional responsibility**. As such, the deployment of AI in academic libraries must be accompanied by robust ethical safeguards that ensure transparency, minimize harm and reinforce the human-centered values upon which the profession is founded.

The Evolving Role of Academic Librarians in the AI Era

Second, the **role of academic librarians is undergoing significant transformation** in response to the integration of artificial intelligence (AI) and other emerging technologies within higher education institutions. Traditionally viewed as custodians and gatekeepers of knowledge resources, librarians are increasingly taking on the roles of **digital mediators, technology facilitators and ethical stewards** in a complex information ecosystem. This shift is not merely operational but strategic, positioning librarians at the intersection of information ethics, technological innovation and user empowerment (Cox, Pinfield, & Rutter, 2019).

As AI tools are embedded into library systems for tasks ranging from automated reference chatbots to machine-assisted metadata generation librarians are called upon to **supervise, evaluate and ethically guide** their implementation. Their responsibilities now include ensuring that AI applications align with professional values such as intellectual freedom, equity of access, user privacy and non-discrimination. Librarians also play a crucial role in promoting **transparency**

and accountability by demystifying algorithmic processes for users and advocating for explainable and fair AI systems (Farnel, 2021).

This expanded role requires librarians to acquire new **competencies in digital literacy,** particularly in understanding how AI algorithm's function, recognizing biases in data-driven systems and interpreting predictive analytics in decision-making contexts. Moreover, librarians must cultivate skills in **critical technology appraisal**, enabling them to question the assumptions, limitations and ethical implications of the tools they deploy. Leadership in this new landscape demands not only technical knowledge but also **ethical foresight and instructional ability**, as librarians increasingly take on the role of educating faculty, students and institutional leaders about responsible technology engagement (Parry, 2022).

Consequently, the professional identity of academic librarians is being reshaped. Their evolving role situates them as central agents in navigating the ethical tensions of digital transformation, ensuring that the adoption of AI enhances rather than undermines the human-centered mission of academic libraries.

2.3 Strategies for Integrating Artificial Intelligence in Reference Services in Academic Libraries

The successful integration of Artificial Intelligence (AI) into academic library reference services requires a strategic approach that balances technological innovation with the professional values and ethical responsibilities of librarianship. While AI offers significant opportunities to improve service delivery, enhance user experiences, and increase operational efficiency, its implementation must be guided by principles that preserve the fundamental mission of academic libraries.

Staff Training and Capacity Building

One of the most important strategies for integrating AI into reference services is the continuous training and development of library personnel. Librarians must acquire competencies in AI technologies, data literacy, digital ethics, and algorithmic decision-making to effectively manage and evaluate AI-enabled systems. Professional development programs, workshops, and collaborative learning initiatives can equip librarians with the necessary skills to work alongside AI tools while maintaining the quality and integrity of reference services (Cox et al., 2019).

Adoption of Hybrid Reference Service Models

Academic libraries should adopt hybrid service models that combine AI capabilities with human expertise. AI-powered chatbots and virtual assistants can efficiently handle routine and repetitive inquiries, while librarians focus on complex research consultations, information literacy instruction, and specialized reference support. This complementary approach ensures that users benefit from both the speed of AI systems and the critical thinking, empathy, and contextual understanding provided by human librarians (Asemi & Asemi, 2018).

Development of Ethical AI Policies and Governance Frameworks

The integration of AI should be supported by comprehensive institutional policies that address ethical, legal, and operational concerns. Libraries need clear guidelines regarding data privacy, algorithmic accountability, transparency, intellectual freedom, and user rights. Governance frameworks should define how AI systems are selected, monitored, evaluated, and updated to ensure compliance with professional standards and ethical principles (Floridi & Cowls, 2019).

Ensuring Transparency and Explainability

Transparency is essential in maintaining users' trust in AI-powered reference services. Libraries should inform users when they are interacting with AI systems and provide explanations regarding how recommendations, search results, or responses are generated. Explainable AI practices enable users to understand the reasoning behind automated decisions, thereby promoting accountability and reducing concerns about algorithmic bias (European Commission, 2020).

Promoting User Privacy and Data Protection

Academic libraries have a long-standing commitment to protecting user confidentiality and intellectual freedom. Therefore, AI systems deployed in reference services must incorporate strong privacy safeguards, including data minimization, secure storage, anonymization techniques, and compliance with relevant data protection regulations. Libraries should also obtain informed consent from users regarding the collection and use of personal data (IFLA, 2020).

Enhancing Equity and Inclusive Access

AI technologies should be designed and implemented in ways that promote equitable access to information services. Academic libraries must ensure that AI-powered reference services are accessible to users with disabilities, individuals from diverse linguistic backgrounds, and those with varying levels of digital literacy. Inclusive design practices can help prevent digital exclusion and ensure that all users benefit from technological innovations (ALA, 2019).

Continuous Assessment and Quality Evaluation

Regular evaluation of AI systems is necessary to ensure effectiveness, accuracy, and fairness. Libraries should establish assessment mechanisms that monitor system performance, user satisfaction, response quality, and ethical compliance. Feedback from users and librarians should be incorporated into ongoing improvements to enhance service quality and mitigate emerging risks (Hervieux & Wheatley, 2021).

Collaboration with Technology Developers and Stakeholders

Successful AI integration requires collaboration between librarians, information technology specialists, software developers, faculty members, and library users. Such partnerships can facilitate the development of AI solutions that

align with academic needs, institutional objectives, and professional library values. Collaborative approaches also promote greater transparency and accountability in AI system design and implementation (Cox et al., 2019).

Balancing Innovation with Core Library Values

Academic libraries find themselves at a pivotal crossroads where they must carefully balance the promise of technological innovation with the enduring values that define the profession. As Artificial Intelligence becomes increasingly integrated into reference services, libraries must exercise ethical vigilance to ensure that these technologies enhance rather than undermine their core institutional principles. These principles include user autonomy, which safeguards individuals' right to control their informational interactions; equity of access, which ensures that all users regardless of socioeconomic status, ability, or digital literacy can benefit from AI-enhanced services; human dignity, which demands that users be treated with respect and consideration; and informed consent, which emphasizes transparency in how user data are collected, stored, and utilized (ALA, 2019; IFLA, 2020).

The appeal of AI lies largely in its efficiency, scalability, and ability to provide instant access to information. However, these advantages should not overshadow the human-centered mission of academic libraries. Without a deliberate and ethically grounded approach to design, implementation, and governance, AI systems may introduce algorithmic opacity, reinforce societal biases, limit intellectual diversity, or reduce complex human information needs to automated interactions. Such outcomes have the potential to erode user trust and compromise the inclusive and intellectually supportive environment that libraries traditionally provide (Floridi & Cowls, 2019).

Consequently, the challenge facing academic libraries is not merely the adoption of AI technologies but their responsible integration into existing service frameworks. This requires embedding ethical safeguards, promoting transparency, ensuring human oversight, and maintaining professional accountability throughout the lifecycle of AI systems. By adopting a reflective and values-driven approach, academic libraries can harness the benefits of AI while preserving the foundational principles of librarianship. In doing so, innovation becomes a means of strengthening rather than replacing the core mission of libraries in supporting learning, research, intellectual freedom, and equitable access to information.

Table 2: Summary of Key Findings on Ethical AI Integration in Academic Reference Services

Key Theme	Core Issues Identified	Implications for Libraries	Relevant Sources
1. Ethical Challenges in AI Deployment	- Algorithmic bias - Privacy risks due to data harvesting - Lack of transparency ("black box") - Accountability gaps	- Risk of reinforcing social inequalities - User distrust in AI systems - Ethical dilemmas in managing sensitive data - Need for clear accountability frameworks	Bevan, 2009; Noble, 2018; Ryan & Stahl, 2021; Floridi & Cowls, 2019
2. Evolving Role of Librarians	- Shift from custodians to ethical stewards and digital facilitators - Need for AI literacy and ethical foresight	- Professional development in AI evaluation - Active role in AI governance - Educating users and stakeholders on responsible tech use	Cox et al., 2019; Farnel, 2021; Parry, 2022
3. Strategies for Integrating Artificial Intelligence	- Staff training and AI literacy- Ethical AI policies and governance - Human–AI collaboration- Transparency and privacy protection - Continuous evaluation of AI systems	- Improved service delivery and efficiency - Increased user trust and accountability - Reduced ethical risks and bias - Preservation of core library values	Asemi & Asemi (2018); Cox et al. (2019); Floridi & Cowls (2019); Hervieux & Wheatley (2021); IFLA (2020)

5. Discussion

5.1 Ethical Concerns Associated with the Adoption of AI Technologies in Academic Reference Services

The findings revealed that the adoption of AI technologies in academic reference services is accompanied by significant ethical concerns, particularly regarding algorithmic bias, privacy, transparency, and accountability. Participants acknowledged the potential of AI tools such as chatbots, recommendation systems, and virtual assistants to improve service efficiency; however, concerns were raised about the possibility of biased outputs, misuse of user data, and the opaque nature of many AI algorithms. These concerns support the arguments of Ryan and Stahl (2021) and Noble (2018), who contend that AI systems may reproduce existing social inequalities when trained on biased datasets.

The findings further suggest that transparency and user consent are essential for maintaining trust in AI-enhanced reference services. Libraries must therefore ensure that users are informed about how AI systems operate, how their data are collected and used, and the limitations of automated recommendations. This aligns with the ethical principles of explicability, responsibility, and fairness proposed by Floridi and Cowls (2019). Consequently, the responsible adoption of AI requires robust governance frameworks that prioritize privacy protection, accountability, and ethical oversight.

5.2 Evolving Roles of Academic Librarians within AI-Enhanced Service Environments

The study found that the integration of AI is reshaping the professional responsibilities of academic librarians. Rather than replacing librarians, AI is transforming their roles from traditional information custodians to digital facilitators, technology mediators, and ethical stewards. While AI systems can efficiently manage routine inquiries and information retrieval tasks, they lack the contextual understanding, empathy, and critical judgment required for complex academic interactions.

These findings support the view of Cox et al. (2019) and Farnel (2021), who argue that librarians must develop competencies in AI literacy, data ethics, and algorithmic evaluation to remain effective in technologically advanced service environments. The results suggest that librarians will increasingly be responsible for monitoring AI systems, identifying potential biases, guiding users in the responsible use of AI tools, and ensuring that automated services align with professional and institutional values.

Importantly, the findings reinforce the continued relevance of the librarian–user relationship. Human expertise remains essential for interpreting complex information needs, supporting research activities, and maintaining the values of intellectual freedom, inclusivity, and user-centered service that define academic librarianship.

5.3 Strategies for the Responsible and Context-Sensitive Integration of AI in Reference Services

The findings identified several strategies for the responsible integration of AI in academic reference services. These include staff training and capacity building, the development of ethical AI policies, adoption of hybrid human–AI service models, transparency in AI operations, and continuous assessment of AI systems. Participants emphasized that AI should function as a complementary tool rather than a substitute for professional librarians.

The findings indicate that successful integration requires balancing technological innovation with core library values such as equity of access, user autonomy, privacy, and intellectual freedom. This supports recommendations by the American Library Association (2019) and the International Federation of Library Associations and Institutions (2020), which advocate for human-centered approaches to AI implementation in libraries.

Furthermore, the study highlights the importance of inclusive and context-sensitive deployment strategies. Libraries should ensure that AI-powered services are accessible to users with diverse technological skills and backgrounds through inclusive design, multilingual support, and the availability of human assistance when needed. Such measures can help mitigate the risk of widening the digital divide and ensure equitable access to information services.

Overall, the findings suggest that the responsible integration of AI requires a balanced approach that combines technological innovation with ethical safeguards, professional oversight, and continuous evaluation. By positioning AI as a tool that enhances rather than replaces human expertise, academic libraries can improve service delivery while preserving the fundamental values that underpin the profession.

This structure directly mirrors your three objectives and makes the discussion chapter more defensible academically because each subsection explicitly interprets findings in relation to a specific research objective and relevant literature.

Proposed Conceptual Framework: Ethical AI Integration in Academic Reference Services
